PREFACE

This book summarizes the selected papers of student conference focused on the current issues in hospitality, tourism, and wellness field. Presented papers deal with investigation of issues and challenges of hospitality, tourism and wellness to make the industries more sustainable and adapt with the changes in the environment. Presented paper bring a wide database of issues and challenges in the field which could be use in the future researcher and industries players in the future.

ABSTRACT

This study aims to find the customer's knowledge, awareness, and attitude; not all consumers have education or knowledge about beauty and cosmetics products in Malaysia. The objective of this study is to discover the relationship between knowledge, awareness, and attitude and consumer purchase intention to buy beauty products. The study was conducted by quantitative research among residents of Kota Bharu Kelantan in Malaysia consumers who normally use beauty products. A total of 384 Respondents participated in this research. The data analysis had discovered the data analysis and finding with the most factor awareness, which achieved the highest mean score of 4.35.

Keywords: knowledge, purchase intention, awareness, attitude, beauty product

INTRODUCTION

As this has grown, multiplied, and become mainstream, they have practiced healthy living, self-help, self-care, fitness, nutrition, diet, and spirituality, which has become a thriving welfare movement in the 21st century (Global Wellness Institute,2014). Since the prehistoric era, both genders have consumed beauty care products in their own way. Femaless always demand a perfect beauty image from a single product. Markets even use females as a symbol to promote enhanced features of their products; as firm as belief is, the higher satisfaction from any brand, the more significant the economic return associated with that brand (Yu,2007)

In 2008, Malaysia decided to introduce a "notification system "as part of the initiative under the Association of Southeast Asian Nations (ASEAN) cosmetic directive. Under these systems, it is necessary to go online and inform the ministry before starting to produce and market the product. Hence, this study focuses on light and new knowledge concerning consumers' factors or real intention in buying beauty products.

This study consists of three objectives:
1.	To identify the relationship between knowledge, awareness, attitude, and consumer purchase intention to buy beauty products.

Significance of the study
Purchasing intention

Having the intention to buy beauty products is not easy because there are many products in Malaysia. The purchase should be made with knowledge and complete care to avoid purchasing faulty products. Research needs to be done because a well-known brand's presence does not guarantee the success and safety of a product to the consumers (Kaličanin & Velimirović, 2016)

Consumer

The findings of this study will help relevant consumers, especially women, as they are consumers of beauty products. This study reminds consumers to be careful in purchasing beauty products — improving decision-making intentions in buying beauty products.

Future of Study

This study will be a reference for the Ministry of Health Malaysia (MOH) and the Ministry of International Trade and Industry (MITI) to be more aware of beauty products. Finally, this study will help to be a guideline for the student who wants to elaborate on the scope of intention to buy beauty products in Malaysia and improve the previous research.

LITERATURE REVIEW

Knowledge of beauty product

The opinion and understanding are distinguished by the presence or absence of the true condition. To meet the belief condition, one must believe in a proposition if he is aware of it. The justification requirement necessitates a practical means of proving the truth of one's own optimism. (Bolisani & Bratianu, 2018). In determining the purchase of products with knowledge, Consumers purchase products based on their knowledge and information. The purchasing process entails determining what they require, conducting research, and evaluating criteria (Lu & Chen, 2017).

The consumer can link knowledge in purchasing beauty products to the purchasing decision-making process in beauty products. To gain knowledge and understanding, customers need to be aware of the products and services they buy. Learning about the brand, distribution from the company, availability, and information about the competitor's products play a role.

The Awareness of beauty product

Definitions of consciousness, like those of the self, present a messy image of what is meant by the term. The terms awareness and consciousness are frequently used interchangeably, as are psychological mindedness and psychological awareness. An individual's ability to get an accurate and thorough understanding of their observation and thought is emphasised in cognitive awareness, the first type of awareness discussed here.

Product chemicals can describe aspects of beauty product awareness because they are crucial in determining product awareness. This awareness is critical for understanding the product's ingredients (Bhardwaj & Verma, 2019). In Malaysia, awareness is closely related to consumers' perceptions and attitudes towards different products. Some consumers are aware of the product and will choose a reliable and safe one. Consumer perception is more of choosing branded cosmetic products and not checking the ingredients that are an issue in awareness (Ayob et al., 2016).

The Attitude of beauty product

Attitude is an interest in marketing research that refers to how individuals view objects as well-known and safe. Hoyer and MacInnis define attitude as "a relatively continuous assessment of the actions involving people, topics, and objects". Perceptions, consequences, and an evaluation of behavior and attitude all play a role in determining a person's attitude toward their actions (K.Marketing, 2017). Attitude expresses general feelings and evokes feelings of like or dislike. It also responds to something against an object. The mood becomes a consideration in changing one's habits with the preferred items.

15

Research Hypothesis

H1   There is a relationship between knowledge and consumer purchase intention to buy beauty products.

H2   There is a relationship between awareness and consumer purchase intention to buy beauty products.

H3   There is a relationship between attitude and consumer purchase intention to buy beauty products.

Research Framework

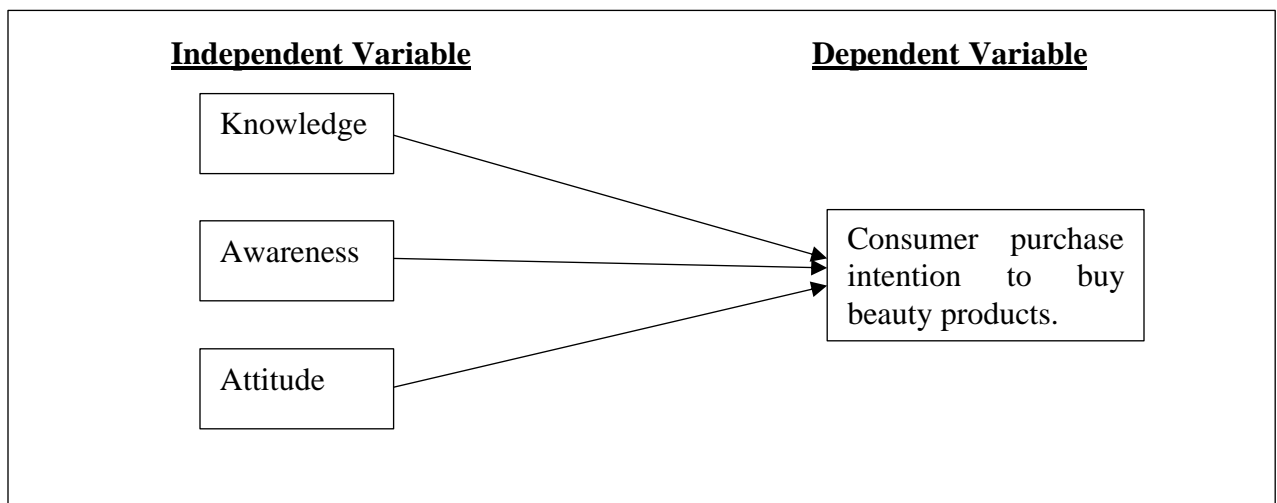
A research framework has been developed to investigate the connection between theresearch variables. The dependent variable of the study is consumer purchase intention to buy beauty products, while the independent variables include knowledge, awareness, and attitude. Figure 1 below shows the research framework used for this study


Figure 1:Research Framework

METHODOLOGY

Research Design

This study has utilised the quantitative method via statistics using a Likert scale survey or questionnaire. The data collection was conducted by distributing questionnaires through google forms. The questionnaire was used to determine the respondent's consumer purchase intention to buy beauty products. By asking the respondents about their knowledge, awareness, and attitude related to beauty products.

Data Collection

The tool utilised in this research is the questionnaires distributed through the google form. The questionnaires were used to collect information regarding knowledge, awareness, and attitude. The questionnaires were distributed online in order to collect data on consumers' purchase intention to buy a beauty product.

Sampling

To conduct this investigation, the researcher has utilised the simple random sample strategy, which is a simple probability sampling strategy. The sample size was calculated using Krejcie & Morgan's (1970) equation to ensure a valid and reproducible sample for this investigation. Following are the steps needed to solve this equation:

$$s = \frac{x^2 N_P(1-P)}{e^2(1-P) + x^2 p(1-P)}$$

n = sample size
N = population size
e = the degree of accuracy expressed as a proportion (0.05)
$x2$ = chi-square of the degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

A frequency analysis, descriptive analysis, and a reliability analysis were employed in the investigation. As a collection and measurement process described by regression analysis, the obtained data were analysed using SPSS to show correlations between the variables.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the result of the frequency analysis

Table 1:Frequency Analysis

Characteristics	Number of Respondent (N)	Percentage (%)
Age		
15-20	33	8.6
21-25	190	49.5
26-30	91	23.7
31-35	32	8.3
36-40	17	4.4
41-Above	21	5.5
Marital Status		
Single	265	69
Married	115	29.9
Divorce	4	1.0
Level of education		
No formal education	1	0.3
SPM	48	12.5
Diploma/STPM/Matrix	121	31.5
Degree	206	53.6
Master	6	1.6
PhD	2	0.5
Race		
Malay	359	93.5
Chinese	13	3.4
Indian	9	2.3
Other	3	0.8
Religion		
Islam	360	93.9
Buddha	7	1.8
Christian	11	2.9
Hindu	5	1.3
Other	1	0.3
Occupation		
Student	191	49.7
Employed	162	42.2
Unemployed	22	5.7

Retired	9	2.3	
Monthly Income			
Less than RM1000	147	38.3	
RM1001-3000	96	25.0	
RM3001-5000	111	28.9	
RM5001-RM7000	15	3.9	
RM7001 and above	15	3.9	

Table 1 depicts the profile of the respondents. Out of 384 respondents, most respondents aged between 21-25 recorded 49.5% of the total sample. Meanwhile, the single marital status has recorded the amount 69%, married 29.9% and divorce 1%. The level of education has portrayed having no formal education as 3%, SPM 12.6%, Diploma/STPM/Matrix 31.5%, Degree 53.6%, Master 1.6 %, and PhD 5%. Race is indicated with Malay 93.5%, Chinese 3.4%, Indian 2.3%, Other 0.8. This is followed by religion which indicated Islam 93.9%, Buddhism 1.3%, Christianity 2.9%, Hindunism 1.3% and others 0.3. The occupation of the respondents has indicated student being 49.7%, employed 42.2%, unemployed 5.7%, and retired 2.3%. Finally, the monthly income has portrayed earning less than RM1000 as 38.3%, RM1001-3000 25%, RM3001-RM5000 28.9%, RM5001-RM7000 3.9%, and RM 7001 and as above 3.9%.

Result of Descriptive Analysis

Table 2 below shows the result of the descriptive analysis

Table 2:Descriptive Analysis

Variables	Items	Mean score	Standard deviation
Knowledge	I have some knowledge of the beauty products I purchased.	4.20	0.730
	I purchase a beauty product based on the information that I gathered from reading.	4.21	0.734
	I purchased a beauty product because of the provided information on the label.	4.17	0.738
	I read the contents of beauty products before making any purchase.	4.20	0.758
	I will get advice from a health professional before buying a beauty product.	3.72	0.949
	I will make sure that I am not allergic to the ingredients used in beauty products.	4.21	0.749
	I will ensure that the product I buy does not perform any testing on animals.	4.06	0.874
	Before purchasing a beauty product, I study from an internet source such as Google or social media.	4.21	0.725
Awareness	I am aware of harmful content that might be included in beauty products.	4.29	0.759
	I am aware of the goodness of a products content to my skin health.	4.34	0.708
	I am aware of the suitability of beauty products according to my skin.	4.30	0.735
	I am aware of making a careful choice when buying a beauty product.	4.34	0.712

	I am aware that some beauty products haves other side effects on my skin, such as itching and redness.	4.32	0.710
	I am aware of the types of chemicals that were used to produce a beauty product I bought.	4.25	0.707
	I am aware of the contents of products that are suitable for my skin.	4.29	0.720
	I am aware that the beauty products I purchased have valid content certification.	4.35	0.692
Attitude	I feel that beauty products can make me look more beautiful.	4.28	0.732
	Past experiences of purchasing do influence my next purchase of beauty products.	4.22	0.763
	I feel that it is difficult for me to try a new beauty product.	3.94	0.856
	I prefer having beautiful skin beauty rather than the side effects of consuming a beauty product.	3.51	1.190
	I use beauty products because it enhances my physical appearance.	4.16	0.759
	I believe in the information provided on the label of the beauty products.	4.13	0.708
	I feel the confidence to use beauty products with approved certification.	4.27	0.683
	Due to its reputation, I am confident in using an international product rather than a local one.	3.87	0.918
Purchase intention to buy a beauty product	I purchase a beauty product to take care of my skin.	4.31	0.722
	I purchased a beauty product to gain self-confidence.	4.23	0.705
	I purchased a beauty product because of the affordable promotion price.	3.96	0.853
	I purchased a beauty product because of the influence of social media.	3.70	1.028
	I purchased a beauty product because of the reputable brand	3.77	0.927
	I purchased a beauty product because the packaging attracted my attention.	3.44	1.164
	I purchased a beauty product because of it's current trend	3.58	1.069
	I purchased beauty products because of the quality	4.32	0.721

Table 2 shows the mean and standard deviation for twenty-four statements under four independent variables and eight under dependent variables based on the survey involving 384 respondents. The highest mean value for knowledge has indicated three items in the knowledge variable that recorded the highest number, to "I purchased a beauty product based on the information that I gathered from reading." Recorded a value of 4.21, where many respondents agreed with the question "I will get advice from a health professional before buying a beauty product", recorded the lowest number of 3.72 value. Other than that, awareness recorded the

highest number for the question "I am aware that the beauty products I purchased have valid content certification." with 4.35, indicating that many agree with this question. In contrast, the lowest score has recorded, a total of 4.25 for the question "I am aware of the types of chemicals that were used to produce a beauty product I bought". Next, the attitude variable recorded the highest score for the question of "I feel that beauty products can make me look more beautiful" with 4.28, showing that many respondents agree with this question. The question "I prefer having beautiful skin beauty rather than the side effects of consuming a beauty product" has recorded a score of 3.51. For the dependent variable, the question "I purchase beauty products because of the quality" recorded a total score of 4.32, indicating that many respondents agreed with this question. On the other hand, the question "I purchased a beauty product because the packaging attracts my attention" recorded the lowest score of 3.44. The statistics have approximately represented the actual demographic tabulation about the consumer purchase intention to buy beauty products in Kota Bharu Area.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis

Table 3:Realibility Analysis

Variable	Number of Items	Cronbach Alpha
Knowledge	8	0.909
Awareness	8	0.964
Attitude	8	0.849
Consumer purchase intention to buy a beauty product	8	0.863

The result of the reliability analysis is indicated in table 3. The Cronbach Alpha value of knowledge is 0.909, followed by awareness with 0.964, attitude at 0.849, and consumer purchase intention to buy a beauty product at 0.863. Consequently, the questionnaire is reliable and valid to be utilised for the study.

Result of Pearson Correlation Analysis

Table 4 below shows the result of the Pearson correlation analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Support/ Not Supported)
H1 There is a relationship between knowledge and consumer purchase intention to buy beauty products.	0.478	H1 is supported
H2There is a relationship between awareness and consumer purchase intention to buy beauty products.	0.379	H2 is supported
H3There is a relationship between attitude and consumer purchase intention to buy beauty products.	0.581	H3 is supported

20

The Pearson correlation with hypothesis H1 shows a relationship between knowledge and consumer purchase intention to buy beauty products supported by a score of 0.478 supported. For H2, the relationship between awareness and consumer purchase intention to buy beauty products is supported with a score of 0.379, followed by H3 which indicates a relationship between attitude and consumer purchase intention to buy a beauty product is supported with a score of 0.581 H3 has recorded the highest score for the Pearson correlation analysis.

DISCUSSION AND RECOMMENDATION

As stated in the study's opening chapter, the discussions are meant to answer issues and address the proposed hypotheses. In general, this study has extensively researched consumer purchase intention to buy beauty products with knowledge, awareness, and attitude.
Based on the study's findings, the current study would provide several recommendations for the purchase of beauty products, and they need to have the knowledge and awareness because it will impact their attitude return.

There are about 384 respondents that filled in the questionnaire that was given previously. This can help the researcher identify the relationship between knowledge, awareness, and attitude and consumers' purchase intention to buy beauty products. In addition, the scope of distributing the questionnaire should be larger and not only focus on females around Kota Bahru, Kelantan. By doing so, the result of the questionnaire will be more comprehensive and accurate.

Future research should allow more time for questionnaire distribution so that researchers may discover people who are more suitable and qualified to be the respondents. For sample sizes of 384 respondents, it is difficult to finish data collection in a short amount of time. Following that, researchers might clarify the goal of the study to the respondents if they become confused while answering the questions

All females should know the right intention when buying a beauty product because they should buy safe and unharmful content beauty product to avoid bad things from happening. All-female needs to be more careful when deciding, especially when it comes to their bodies and health

CONCLUSION

In conclusion, this study has managed to discover the consumer intention to buy beauty products. Three independent variables, namely, knowledge, awareness, and attitude, have been chosen to examine their relationships with the dependent variable: consumer intention to buy beauty products. A total of 384 respondents consisting of females from at Kota Bharu, Kelantan, categorised as students, employers, unemployed, and retired, have participated in examining their real intention of purchasing beauty products. Based on Pearson's correlation analysis, knowledge scored a value of *0.478, followed by awareness with *0.379 and attitude with *0.581.

ABSTRACT

Social media has become an important medium for knowledge, awareness, intention, and action. Social media are internet-based channels that enable individuals to engage and choose to self-present with both large and limited audiences that receive value from user-generated material and the sense of contact with others, either in real-time or asynchronously. Therefore, this study aims to assess the role of social media in promoting a healthy lifestyle among residents around Kota Bharu and UMK students from FHPK and FKP. A total of 362 respondents participated in this study through a questionnaire that was distributed on social media such as WhatsApp and Facebook. The results of the study show that the attitudes and awareness of the community and students related to healthy lifestyle practices are very important in life.

Keywords: Social Media, Healthy Lifestyle, Knowledge, Awareness, Intention

INTRODUCTION

The chapter will begin by providing background information for the study, then introduce the proposal's topic before going on to the content subheadings. The subheadings problem statement, research purpose, and research question are used to focus on the study's statement. The information for this chapter 1 is completed by the scope of the study, the significance of the study, the definition of words, and the summary. "Social networks" and "social support" are not synonymous phrases (Arsenault & Castells, 2008). Social support is characterised as emotional, instrumental, and financial help from one's social network. People frequently think of support as a two-way trade or transaction. Support can take the form of emotional concern, instrumental aid (goods and services), information, or appraisal, according to House (information relevant to self-evaluation). In a similar vein, it refines a concept developed by defining support as "the degree to which a person's basic social needs are addressed through connection with others" (Kaplan et al., 2015).

The definition of a healthy lifestyle is a requirement for the reproduction of society's human resources. The willingness of young individuals to live a healthy lifestyle and care for their health has an impact on their ability to work as well as their expected lifetime. Young people's negligence, on the other hand, exposes them to a variety of diseases and poses significant health and life risks (Chou et al., 2019). 'Lifestyle' is a contentious term in the context of health promotion. On the one hand, it is an undeniable health determinant, and as such, it is the primary focus of traditional health education; on the other hand, the widespread use of lifestyle in health education reveals a limited and superficial understanding of the nature of health and the priorities for health promotion. The work of sociological theories must be used to build a more comprehensive analysis of the structural characteristics of lifestyles. Pierre Bourdieu's concept of 'habitus' has been cited by a number of authors. By elaborating on the implications of Pierre Bourdieu's idea of 'field' and the relational implications of his concept of 'field,' this work relies on a hitherto overlooked part of Pierre Bourdieu's analysis of lifestyles (Jaime R. Deluca, 2013). This study consists of three objectives:

1. To identify the healthy lifestyle among adults.
2. To create awareness of a healthy lifestyle among adults.
3. To explore healthy lifestyle among adults.

Significance of the Study

Based on this study, social media is positioned as a powerful medium to reach, change physical activity and influence our behavior. When the physical activity increases, this influences healthy modification to food intake and causes beneficial changes to our body composition or body weight. Plus, the importance of social media for physical activity is grounded in social media's extensive reach and the affordance of information for people in the world. For sharing the information within the population, social media could be used as a platform to give the information to people. In addition, the role of the government also needs to be implemented to provide awareness about a healthy lifestyle to the community. In this regard, the government needs to work together in holding an awareness campaign on healthy lifestyles so that all communities are more aware of the statement.

Besides, the campaign carried out by the government should be aligned with the mission to help the community to be more aware of the level of community health in this country. Plus, the role of Non-Governmental Organizations (NGOs) should also assist the government in conducting various programs, including campaigns and motivating the community on a healthy lifestyle so that the community is not complacent with the level of health at that time. For example, NGOs can run activities or programs such as healthy lifestyle talks. The determination of various parties can help the community in maintaining proper health.

LITERATURE REVIEW

Knowledge

In particular, the findings of this study added to the body of knowledge on how young adults weigh up the exchange proposed by the behavior proposition of adopting a healthy lifestyle. In terms of the behavior suggestion of adopting healthier food, alcohol and physical activity practices, the young adults partially accepted the suggestion. They indicated that they were either trying to adopt healthier food and/or physical activity practices or would do so in the future. However, they did not want to adopt healthier alcohol behaviors to reduce binge drinking episodes, which is consistent with previous research (Gill, 2002). In the research, this presented difficulties in practice, such as choosing which nutrients to target, the level at which a tax is set, how best to learn from the evidence base surrounding the effectiveness and acceptability of food taxes and ensuring health inequalities are not exacerbated (Mytton et al., 2012).

Awareness

People can live a healthy lifestyle in a variety of ways. To begin this healthy lifestyle, people must be aware of the necessity of leading a healthy lifestyle, check their food consumption, get adequate exercise, and learn how to appropriately manage their stress (Anusha Thavarajah, 2016). Many healthy lifestyle campaigns have been launched to enhance public awareness of the need to live a healthy lifestyle. Despite all the efforts made to urge individuals to have a healthy lifestyle, some of them continue to ignore the advice and live an unhealthy lifestyle. It is difficult for them to abandon their previous eating and social habits, but nothing is impossible if people want to change.

Intention

The Theory of Intention suggests that a person's behavior is determined by their intention to perform the behavior and that this intention is, in turn, a function of their attitude toward the behavior and subjective norms (Fishbein & Ajzen, 1975). The best predictor of behavior is intention or instrumentality (a belief that the behavior will lead to the intended outcome). Instrumentality is determined by three things: their attitude toward the specific behavior, their subjective norms, and their perceived behavioral control. This suggested that the more promising the attitude and the subjective norms and the greater the perceived control, the stronger the person's intention to perform the behavior.

Action

Action means the first crucial step a person can take to have a healthy lifestyle is to watch what he or she eats. Healthy eating has been defined as health-promoting activities that avoid various pathologies and illnesses and promote people's well-being. According to Davis and Stoppler (2018), a person should have three meals a day: breakfast, lunch, and supper, and he or she should control the amount of food eaten each time. Eating a balanced diet, exercising often, and not smoking are all healthy lifestyle choices that can greatly reduce the risk of coronary heart disease (CHD) and other chronic illnesses (Ahmad Taufik, 2017).

Research Hypothesis

The literature study revealed that independent variables, such as the role of social media on knowledge, awareness, and intention, were highlighted in the literature review. As a result, the role of social media in action was the dependent variable. The hypotheses of this study were summarized in the following way, based on the literature discussed

H1   A balanced diet is a significant role on action towards healthy lifestyles among adults.

H2   There is significant level of awareness toward healthy lifestyles among adults.

Research Framework

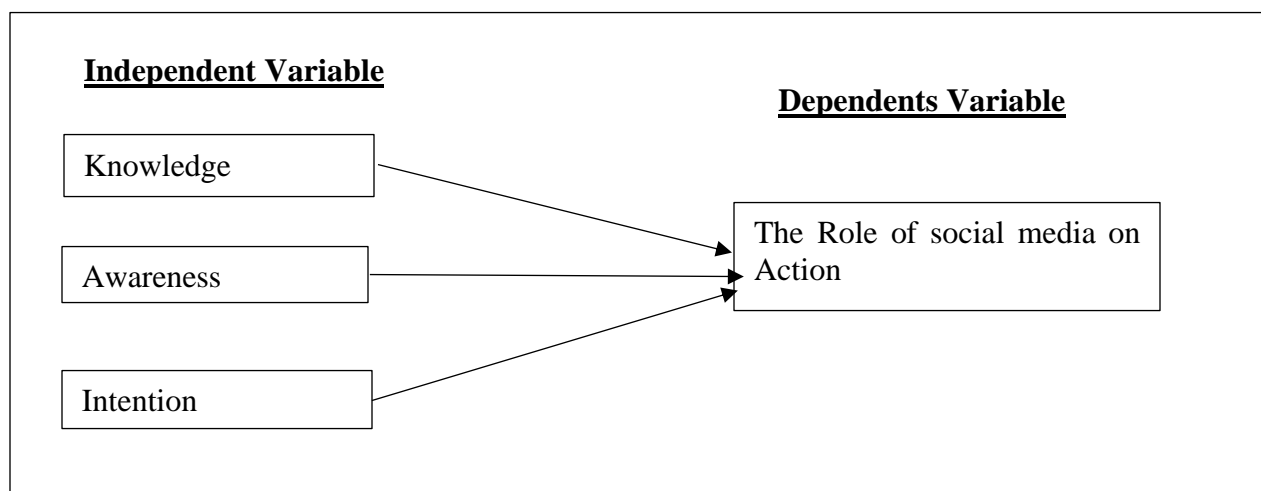
The Figure 1 below shows the research framework use for this study.


Figure 1: Research Framework

METHODOLOGY

Research design

Research design is a framework for planning the research and answering the research questions. This can also help to get the data about the independent variables and dependent variables for this study. The research design can help to develop research methods which are appropriate for the aim of this study. This study was quantitative. The quantitative research design in this study aimed to and provide data for a better perspective on business decisions and to improve any organization. There are four quantitative data that we used to conduct for this research such as online survey data, frequency distribution, descriptive measures and correlation.

Data Collection

Data collection is the procedure of collecting, measuring, and analyzing accurate insights using standard validated techniques on the basis of the facts gathered, that a researcher might assess their hypothesis via those data collected. There are 362 respondents among young people around Kota Bharu and the students of UMK in FHPK and FKP faculties. Respondents had to answer all the questions given and the thorough study findings were obtained from the questionnaires. Researchers needed to focus on the independent variables that contributed to the role to promote a healthy lifestyle. The researcher got the answers randomly from the questionnaire that was distributed.

Sampling

Sampling is a strategy for picking individual members or a subset of the population in order to make statistical inferences and estimate population characteristics. The sampling method was as thorough as feasible in order to assure the least amount of error and bias and to maximize representativeness (Tyrer & Heyman, 2016). Probability sampling techniques included a random selection component, which assured that each instance in the population had an equal chance of being chosen (Shorten & Moorley, 2014). The formula of this equation was as follows:

$$S = \frac{x^2 N_P (1-p)}{e^2(N-1) + x^2 P(1-p)}$$

n = sample size
N = population size
e = the degree of accuracy expressed as proportion (0.05)
$x2$ = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

Tools for data analysis made it easier for users to process and manipulate information, analyse the relationships and connections between data sets, and help to detect perception patterns and trends. Here is a full list of methods used to analyse the results. To understand the issues that arised in the research performed, data analysis was used as the method of producing raw data into structured information. After all the information was obtained from the respondents, the researchers used SPSS software to generate data. Below are the steps of the data analysis in this study. It started with a descriptive analysis of the data, followed by the analysis of reliability and ended with hypothesis testing using Pearson Correlation.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the result of the frequency analysis.

Table1: Frequency Analysis

Characteristics	Number of Respondent (N)	Percentage (%)
Gender		
Male	153	42.1
Female	206	57.6
Age		
15 - 20 years old	19	5.2
21 - 24 years old	81	21.1
25 – 30 years old	91	25.1
31 - 35 years old	64	16.7
36 – 40 years old	29	8.0
41 and above	42	10.9
Race		
Malay	239	62.2
Chinse	93	24.2
Indian	41	10.7
Others	11	2.9
Religion		
Islam	302	83.2
Christian	23	6.3
Buddha	22	6.1
Hindu	12	3.3
Other	2	0.6
Marital Status		
Married	113	31.1
Single	243	66.9
Divorce	6	1.7
Level of Education		
No Formal Education	4	1.1
SPM	36	9.9
STPM	81	22.3
Diploma	87	24.0
Degree	126	34.7
Master	19	5.2
PhD	9	2.5
Living Area		
Urban	217	59.8
Sub-Urban	35	9.6
Rural	108	29.8
Occupation		
Student	202	55.6
Employed	135	37.2
Unemployed	18	5.0
Retired	7	1.9
Monthly Income		
Less Than RM 1000	209	57.6
RM 1000 – RM 3000	81	22.3

RM 5000 – RM 7000	35	9.6
RM 7000 and above	37	10.2
The Average Frequency of Using a Social Media Per a Day		
More than 1 hour	38	10.5
More than 2 hours	58	16.0
More than 3 hours	97	26.7
More than 4 hours	169	46.6

Table 2 shows a total of 209 respondents that were women, 57.6 percent of the total, while 153 male respondents, representing 42.1% percent of the total. The total for respondents between the ages of 25 to 30 years old indicated the highest number of study participants (91), contributing to 25.1% of all study participants, while those between the ages of 15 to 20 years old indicated the lowest number of study participants which was 19, figuring for 5.2 percent of all study participants. With a total of 81 people, or 21.1 percent of responses, the age group of 21 to 24 years old was the second largest of participants. There were 64 people who represented for 16.7 percent of the respondents aged from 31 to 35 years old. Malay respondents had the greatest numbers of respondents (239), or 62.2 percent, while others had the lowest numbers of 11 respondents (2.9%). While Chinese had the second-highest number with a total of 93 respondents (24.2%), Indians came in third with the number of 41 respondents (10.7%). Most respondents in this study gained a degree, with a total of 126 people, or 34.7 percent. In addition, Diploma was recorded as the second-highest number of respondents' education qualification with 87 total numbers (24.0%), STPM in third place with 81 respondents, leading to a total of 22.3 percent, and PhD was the second lowest number of achiever with only 9 respondents, or equivalent to 2.5 percent. The majority of respondents in this study were students, with a total number of 202 people, or 55.6 percent. Employed respondents were recorded as the second-highest number of respondents, with 135 in total (37.2%). Unemployed was in third highest number, with a total of 18 respondents, which was 5.0 percent out of all the education qualification background of all respondents. The total number of the retired respondents were recorded as the lowest number with only 7 respondents, or 1.9%. According to the statistics, the highest number of respondents' marital status was single, which figured for 243 respondents (66.9%). According to the survey, Islam was recorded as the religion that attained the highest numbers of respondents' religious backgrounds, which were 302 respondents (83.2%). In comparison, the second biggest religion among respondents was Christianity, with 23 respondents that were from the religion or 6.3 percent out of the total number of respondents. Meanwhile, the number of respondents with Buddhism religion background was recorded as the third lowest, with 22 respondents or 6.1 percent. Hindus made up 3.3 percent of respondents, while others made up 0.6 percent. According to the statistics, the average time spent on social media for those who were most affected was more than 4 hours (169 respondents or 46.6 percent).

Result of Descriptive Analysis

Table 2 below shows the result of the descriptive analysis.

Table 2: Descriptive Analysis

Variables	Items	Mean Score.	Standard Deviation
Knowledge	Social media act as a knowledge sharing medium on healthy lifestyles	4.19	0.763
	Social media act as an information exchange medium on healthy lifestyles by social media	2.97	1.379
	Impact on the position of knowledge on the healthy lifestyles in social marketing with networking sites	2.89	1.118
	I did a search for information on social media about healthy lifestyles	2.65	1.121
	The provision of information through social media technologies on healthy lifestyles are significant	2.85	1.116
	I easily get various information related to healthy lifestyle from social media	2.94	1.143
	I realized the importance of a healthy lifestyle in my life routine by browsing a social media	3.01	1.356
	Social media has proposed that healthy lifestyle is very important to avoid various health problems	3.06	1.379
Awareness	I am aware that social media could give people the information on healthy lifestyles	4.30	0.728
	I am aware that social media could provide a valuable tip to rise on awareness on healthy lifestyles	4.26	0.742
	I am aware that the value of healthy living could be found from reading that available in social media	4.24	0.753
	I am aware that healthy lifestyles guidelines can access from social media	4.34	0.693
	I realized that I was enjoying a healthy lifestyle from what has been shown in social media	4.14	0.850
	I realized that social media help to improved health quality through its published content	4.30	0.729
	I recognize that everyday social media has influenced me to pursue a healthy lifestyle	4.20	0.786
	I recognize that social media is an unavoidable part of life	4.34	0.724
Intention	I use social media to become familiar on healthy lifestyles	4.13	0.830
	I use social media to get information regarding a healthy lifestyles	4.22	0.763
	I use social media to stimulate a positive attitude in healthy lifestyles	4.28	0.751
	I use social media because its play a role as change agent towards healthy lifestyle	4.25	0.757
	I use social media because it could provide in ideas for a healthy lifestyle	4.33	0.7533
	I use social media because it is starting point of attitude change towards a healthy and active lifestyle	4.32	0.742

	I use social media to improve the level of quality of health can be found	4.30	0.746
	I use social media to encourage me to adopt a healthy lifestyle	4.32	0.751
Action	Social media influenced my actions to adopt a healthy lifestyle	4.24	0.762
	Social media influenced my actions to do better to achieve a healthy lifestyle	4.27	0.772
	I want to practice a healthy lifestyle to maintain healthy by what recommended in social media	4.30	0.772
	Social media influenced me to get more information about healthy lifestyle practices	4.30	0.733
	I will use social media to solve problems related to healthy lifestyle	4.29	0.802
	I believe the information available on social media will strengthen my understanding of healthy lifestyle practices	4.30	0.752
	I feel convinced to use social media to find information provided about healthy lifestyles	4.23	0.824
	I want to put healthy lifestyle as my priority because social media was promoted it through its content	4.27	0.774
	I will take a serious concern in healthy lifestyles from what had been suggested in social media	4.26	0.753

Table 2 presents the descriptive statistics for "The Role of social media of Knowledge" items that were collected from 362 respondents. The mean and standard deviation value for the dependent variable, which was "The Role of social media of Knowledge", items. As shown from the table above, the highest mean score is 4.19 with a standard deviation value of 76355, which was the description of "too much access during every day". Meanwhile, the lowest mean score was 2.65, with a standard deviation value; 1.121. The items for "The Role of social media on Awareness" descriptions, as shown in the table above, the highest mean score was 4.34 with a standard deviation value of 72457. Meanwhile, the lowest mean score was with 4.14 the standard deviation value which was 85068. The items of "The Role of social media on Intention" description was as shown in the table above that the highest mean score was 4.33 with a standard deviation value, of 75336 and the lowest mean score was 4.13 with a standard deviation value; 8306.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Knowledge	9	0.870
Awareness	8	0.828
Intention	17	0.928
Action	9	0.884

Table 3 shows the reliability analysis for knowledge, awareness, intention and action. According to Cronbach's Alpha, coefficient must show the knowledge value of 0.870, the awareness value of 0.828, the intention value of 0.928 and the action value of 0.884. Thus, the

questionnaire was reliable and can be used for the study. It was most commonly used when the questionnaire was developed using multiple scale statements and therefore, to determine if the scale was reliable or not.

Result of Pearson Correlation Analysis

Table 4 shows the result of the Pearson correlation analysis.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result-(Supported/Not Supported)
H1: Balanced diet is a significant role on action towards healthy lifestyles among adults.	0.870	H1 is supported
H2: There is significant level of awareness towards healthy lifestyles among adults.	0.828	H2 is supported

Table 4 illustrated the Pearson correlation coefficient, significant value and the number of cases which was 362. The correlation coefficient of r = 0.870, p < 0.01 suggested a strong positive correlation between "significant role on action" towards "healthy lifestyles". Moreover, the result suggested that there was a strong positive correlation between the significant level of awareness towards healthy lifestyles with r = 0.828, p < 0.01. Overall, the independent variables were significantly correlated with English language proficiency and in strong positive correlation.

DISCUSSION AND RECOMMENDATION

This discussion aims to resolve all the questions proposed and address the hypotheses as stated in the first chapter of this study. In general, this study has covered assessing the role of social media to promote a healthy lifestyle. Based on the findings of previous studies, this section will suggest some suggestions that need to be made for researchers to implement studies more easily in the future. This allowed researchers to realize their responsibility to make the surrounding community and students aware of assessing the role of social media to promote a healthy lifestyle. Researchers also play a big role in making the public aware of the advantages of social media in disseminating important information related to healthy lifestyles and how to practice them correctly and appropriately. Health care is very important to keep the community in a healthy state while students also need to know how to maintain healthy life despite their daily business.

Accurate research findings are also important to ensure the continuity of research in the future. Therefore, the questions of the demographic section of the respondents should be provided in full. Such as gender, occupation, age, race, religion, and other aspects. This was to ensure that the study findings were more accurate. As mentioned in the study's title, the study was to assess the role of social media to promote a healthy lifestyle. Therefore, the results of the study findings from the respondents 'answers should also be more varied.

Furthermore, it is suggested that future researchers should improve the design of distribution of questionnaires methods that it should require the timeframe of distribution. As the questionnaires were distributed over the internet, thus it is better if future researchers are able to distribute the questionnaire via face-to-face methods. This can make it easier for respondents to answer if they are confused about some questions. A relatively long period of distribution is required so that the questionnaire can be answered by the respondents appropriately to the

specified characteristic features. In addition, other suggestions are regarding the selection of target respondents, which are also important for the accuracy of the study. If the questionnaire is conducted face to face, the researcher is able to ensure the accuracy of the respondents' characteristics that they want. The purpose of the study can also be discussed perfectly.

CONCLUSION

In conclusion, this study achieved the aim to assess the role of social media to promote a healthy lifestyle. Three independent variables, that are knowledge, awareness, and intention, were selected to study their relationship with the dependent variable, namely action toward healthy lifestyles among adults. A total of 362 respondents have been selected among residents around Kota Bharu and UMK students from FHPK and FKP.

The Determinant of Prevalence Factors of Mental Health Associated with Adolescents

Hasmidah binti Matusin, Miroshaa A/P Moorthy Siti Maisarah binti Sayuri, Tuan Nurul Izzah binti Tuan Ali &* Naziatul Aziah binti Mohd Radzi

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

ABSTRACT

The increase of mental disorders has been a severe issue concerning mental health among adolescents. Four out of ten adolescents aged 17 and above often experience extreme emotional stress. Such problems will contribute to the increase in depression, anxiety, stress, and many more that are related to mental health. This study aims to identify the factors of mental health among adolescents and the relationship between mental health among adolescents. This study was conducted using a quantitative research approach among adolescents in Kota Bahru, aged 17 years old until 25 years old. A total of 401 respondents among adolescents in Kota Bharu, Kelantan, have participated in this study. Based on the data and findings, the result is related to adolescent relationships and mental health factors.

Keyword: Social Factors, Economy Factors, Environmental Factors, Mental Health

INTRODUCTION

Stress and depression issues affecting mental health are caused by several factors, namely environmental, social and economic factors. Some symptoms related to such illness are insomnia, which is the difficulty in having good sleep. In addition, victims will have the problem of losing focus when performing tasks. This is due to the poor level of mental health, especially involving adolescents. This can be influenced by the way they think and changes in mood and behaviours among adolescents (Mojtabai. et al., 2015). This can cause negative acts like taking alcohol, drugs and so on to reduce their stress and depression. Not all adolescents know the factors that can cause health problems before seeking treatment. Therefore, this study is important in order to reduce mental disorders among adolescents in Malaysia.

This study aims to investigate the factor of mental health among adolescents in Kota Bharu, Kelantan. Nowadays, adolescents are affected by mental disorders because they have many challenges in life during their age. The poor level of mental health among adolescents has a huge impact on their physical well-being and can cause emotional and health problems. For example, taking alcohol and drugs can cause abnormal heart rate and heart attack. Furthermore, drug injections can also cause damage to nerves and infections at your heart pump. Hence, adolescents must know the impact of mental health or disorders that are very related to their life. In addition, they also need to know the factors that can cause mental health in their daily activities. In fact, many cases are related to mental health among adolescents.

Significance of the Study

Based on this study, the researcher aims to identify adolescent mental health factors. Other than that, the study also aims to give awareness and knowledge about the behaviour related to mental health. This allows them to know more about mental health and its factors. With such information, people can spread awareness and share information with their relatives or friends to avoid mental health issues. It indirectly helps adolescents and society to prepare themselves

against mental health problems and factors associated with adolescents' awareness and knowledge of mental health.

Besides that, this study can be used as a valuable reference for future researchers. This may become the second tool for future researchers by using other types of methodologies for mental health studies among adolescents. The researcher needs to learn and understand more about mental health and its disadvantages. A future investigator can use this study to compare with future studies. It allows the future investigator to know whether the human perception of mental health has changed and if the problem of mental health is reduced.

LITERATURE REVIEW
Mental Health
Adolescents' mental health can happen at the age of 19 and above. Mental health can be the cause of anxiety, depression and stress affected by daily activities and emotional activity, according to Westrupp (2021). Adolescents can experience stress when they have so many things that they need to focus on. For example, adolescents who are studying also need to focus on working because they need to cover the expenses due to financial problems in the family. Because of that, adolescents can experience stress because they need to focus more than usual and while having many issues in academics. They can feel less motivated and have less concentration because of work and academic pressure. Mental health among adolescents can be related to three factors: environment, social, and economical.

Environment Factors
Environmental factors can influence mental health among adolescents because they are easily influenced by their social surroundings like parents, friends, neighbourhood and so on. The relationships that can impact mental health among adolescents are closely related to relationships with friends because friends are important in their life to share problems and to socialise. Parents can also influence adolescents' mental health because parents are very important in their lives. Broken homes or divorced parents can cause mental health issues among adolescents.

Social Factors
Social factors are very related to mental health among adolescents because nowadays, technology has become more popular. Social factors can be related to social media that can influence mental health because it can lead to the rise of suicidal behaviours, depression and loneliness (Rosenstein & Sheehan,2018: Twenge, Joiner, Roger & Martin,2018). Technology and media have many benefits, but sometimes they can negatively impact society by causing depression, anxiety and stress.

Economic Factors
The economic factor is important in supporting daily expenses and necessities in life. Nowadays, many adolescents that are working and experiencing severe financial hardship are more likely to develop mental health problems such as depression and substance abuse, particularly alcohol abuse and many more. These issues happen when they have difficulty covering their daily expenses because of their low income.

Research Hypothesis
In this study, the following four hypotheses are formulated based on the research objectives

H1: There is a significant relationship between economic state and mental health among adolescents.

H2: There is a significant relationship between social factors and mental health among adolescents

H3: There is a significant relationship between environmental factors and mental health among adolescents.

Research Framework

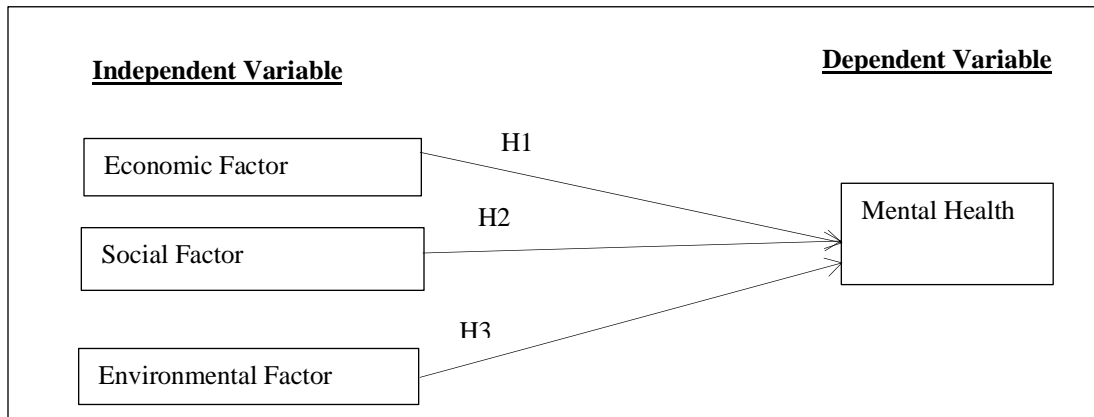
Figure 1 shows the research framework used for this study.


Figure 1: Research Framework

METHODOLOGY

Research Design

This study has utilised a quantitative method via statistics through the use of large-scale survey research to collect information by distributing a set of questionnaires through Google Forms. The research design guarantees that the data obtained enables the researcher to solve the research challenge successfully. The research design is an interpretative approach that may be deemed appropriate for the investigation. The examination structure of this research is quantitative. The data collected from respondents will be used as the primary data in this study. The data acquired will assist in establishing a link between independent and dependent variables via this examination framework, which also involves the arrangement and organisation of a research strategy

Data Collection

In the first stage, this study involved primary data collection using questionnaires collected via Google Forms, which were distributed to 401 respondents who participated in this study. The respondents were also selected among adolescents in Kota Bharu, with an average age of 17 to 25.

Sampling

The probability sampling technique was the sampling method used in this study, particularly simple random sampling, which is a straightforward probability sampling strategy. The researchers have used Krejcie & Morgan's (1970) equation to determine the sample size to obtain a reliable and valid sample for this study. The formula of this equation is as follows:

$$S = \frac{x^2 N_P(1-p)}{e^2(N-1) + x^2 P(1-p)}$$

n = sample size

N = population size
e = the degree of accuracy expressed as a proportion (0.05)
$x\,2$ = chi-square of the degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

Based on this study, the data were obtained through the questionnaires that were distributed among the respondents. With the data, the researcher can identify the factors of mental health among adolescents in Kota Bharu, Kelantan. The data from this study were analysed by conducting frequency analysis, descriptive analysis, correlation analysis, and reliability analysis. The collected data were analysed using Statistical Package for the Social Sciences (SPSS) to show the relationships between the dependent and independent variables as a set of statistical processes approximated by regression analysis.

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of the frequency analysis

Table1: Frequency Analysis

Characteristics	Number of Respondent (N)	Percentage (%)
Gender		
Male	141	35.2
Female	260	64.8
Age		
17 - 19 years old	43	10.7
20 - 22 years old	140	34.9
23 - 25 years old	218	54.4
Ethnic Group		
Malay	302	75.3
Chinse	55	13.7
Indian	42	10.5
Others	2	5
Religion		
Islam	303	75.6
Buddhism	51	12.7
Hinduism	44	11.0
Others	3	7
Marital Status		
Married	53	13.20
Single	344	85.8
Divorced	4	1.0
Level of Education		
SPM	72	18.0
Diploma	94	23.4
Degree	206	51.4
Master	17	4.2
PhD	12	3.0

Table 2 indicates the demographic factors of the respondents. Based on the gender of the respondents, this study involved 400 respondents among adolescents in Kota Bahru, Kelantan. 401 respondents consist of 35.2% males and 64.8% females. It shows that the total number of female respondents is more than male respondents. Based on age, 10.7% of them are between

37

17 - 19 years, 34.9% are between 20 - 22 years, and 54.4% are between 23 - 25 years. Based on race, 61.5% are Malay compared to Chinese and Indians, which are 10.7% and 14.8%. While the respondents for other are 5.0%. Based on religion, 75.6% are Islam compared to Buddhism and Hinduism, which are 12.7% and 11.0%. Other religions are recorded at 7.0%. Based on the level of education, the highest number collected in this section is 51.4% who are degree students. Followed by diploma with 23.4%, SPM 18%, Masters 4.2% and 3.0% are PhD students. Based on marital status, 85.8% are single, 13.2% are married, and the divorce rate is 1.0%.

Result of Descriptive Analysis

Table 2 shows the result of the descriptive analysis of this research.

Table 2: Descriptive Analysis

Variables	Items Mean Score.	Mean	Standard Deviation
Economic Factor	I believe that youth with strong financial resources are often considered popular.	3.39	0.933
	I am having financial problems buying internet quota for my online classes.	3.30	1.222
	I feel stressed thinking about my family's financial problem	3.44	1.190
	I am having difficulties in choosing my career path.	3.63	1.048
	I used to work to cover my expenses	3.39	1.214
	I used to work to strengthen my financial condition	3.86	1.093
	I am being dependent on help from others to manage my daily life	3.30	1.225
	I feel difficult to manage my financial state	3.41	1.122
Social Factor	I always feel alone	2.98	1.263
	I don't have a positive feeling at all	2.79	1.257
	I found it difficult to work on the initiative of doing things	3.06	1.279
	I don't have friends to share my problem	2.83	1.290
	Friends often say negative things about me	2.74	1.270
	My parents often scold me for no reason	2.53	1.351
	I always have quality time with my family	3.57	1.179
	I think my parents do not understand me	2.65	1.316
Environment Factor	The current exposure of cases such as bullying, crimes and murders can affect my mental health	3.60	1.180
	An uncomfortable living can cause deterioration of my mental health	3.97	1.011
	Relationship problems with family and friends can affect my mental health	3.99	0.954
	The unmotivated people around me can make me feel depressed	3.80	1.083
Mental Health	Have you ever been diagnosed with a mental disorder before?	2.18	1.084
	How would you rate your mental health	4.03	1.274

How frequently do you feel upbeat or positive about your life 3.20 I often have experienced an "attack" of fear, anxiety, panic or any extreme emotions or mood swings	3.19	1.227 1.190
I am having trouble focusing at work or studying 3.41 Lately, I always face trouble falling asleep, staying asleep or sleeping too much	3.47	1.144 1.218
I recently felt disappointment or sadness without reason	3.05	1.265
I often experience loss of appetite and eating habits changes in any way recently	2.97	1.290

Table 2 shows the mean and standard deviation for five statements under three independent variables and dependent variables based on the survey involving 401 respondents. The statement with the highest mean value of 3.39 is indicated with the statement 'I believe that youth with strong financial resources are often considered popular. 3.44 with "I feel stressed thinking about my family financial problem," and "I am having financial problems buying internet quota for my online classes" indicates the lowest mean score of 3.30. For the social factor, the highest mean score of 3.57 is indicated by the statement 'I always have quality time with my family." "I don't have friends to share my problem" has the lowest mean score of 2.53. Next is environmental factors with the highest mean score of 3.99 with the statement "relationship problems with family and friends can affect my mental health", and standard deviation value is 3.94 in the statement "unhealthy learning environment can affect my mental health." The statement with the lowest mean score is 3.60 with the statement "The current exposure of cases such as bullying, crimes and murders can affect my mental health." The highest mean is 4.03 with the statement "how would you rate your mental health and .20 mean on the statement "how frequently do you feel upbeat or positive about your life." The lowest statement is "I often experience loss of appetite and eating habits changes in any ways recently." The lowest mean is recorded at 2.18.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis of this research.

Table3: Reliability Analysis

Variable	Number of Items Cronbach Alpha
Economy Factors	8 0.837
Social Factors	8 0.903
Environmental Factors	8 0.894
Mental Health	8 0.480

Table 3 shows that the Cronbach alpha coefficient of the economic factor is 0.837, the social factor is 0.903, and the environmental factor is 0.894. While for the mental health associated with adolescents' reliability test, Cronbach's alpha has obtained a value of 0.480. This Cronbach's Alpha value indicates the result from 0.480 to 0.903. Thus, the coefficient obtained for the questions of the independent and dependent variables is valid and can be used for analysis.

Result of Pearson Correlation Analysis

Table 4 shows the result of the Pearson correlation analysis.

Table4: Pearson Correlation Analysis

H	Relationship	p-Value	Result (Supported/ Not Supported)
H1:	There is a significant relationship between the economic factor and mental health among adolescents	0.541	H1 is supported
H2:	There is a significant relationship between social factors and mental health among adolescents	0.373	H2 is supported
H3:	There is a significant relationship between environmental factors and mental health among	0.460	H3 is supported

The result in Table 4 indicates the economic factor and mental health among adolescents to be at 0.460, which indicates positive and weakly related to mental health among adolescents. Following social factors and mental health among adolescents, the value of 0.541 indicates a positive and weakly related influence on mental health among adolescents. Meanwhile, environmental factors on mental health among adolescents show that 0.373 is positive and weakly related to the influence on mental health among adolescents.

DISCUSSION AND RECOMMENDATION

Discussion is aimed at solving questions and addressing hypotheses, as mentioned in the first chapter of this study. In general, this study has extremely researched the determinant of prevalence factors of mental health associated with adolescents. Based on the findings of the study, the current study would provide several recommendations about how to overcome problems that contribute to mental health among adolescents.

The study's prescription for overcoming mental health problems among adolescents is to live a healthy lifestyle that includes eating a balanced diet, drinking eight glasses of water per day, avoiding smoking or using drugs, and exercising three times per week. Adopting a healthy lifestyle improves both mental and physical health. Furthermore, going out with pals may deliver advantages as well as emotional support. We may communicate long-hidden feelings and receive emotional support from friends with trusted friends, allowing negative emotions to be expelled from our bodies. Next, de-stress by engaging in activities you like, such as playing video games, listening to music, dancing, or surfing the internet. Set the goals, so don't leave the valley of life. We are more focused on life planning and committed to reaching the intended goals when we have goals if you are unable to manage mental health concerns and can seek professional assistance, such as therapy.

The study findings are also necessary for the continuation of future research. As a result, it is suggested that future research examines the knowledge about the determinants of prevalence factors of mental health among adolescents by including more demographic characteristics of the respondents such as ethnicity, religion, monthly income, marital status, occupation, and many more to generate different results or findings from various perspectives.

Furthermore, future researchers could improve the data collection for this study, particularly in terms of questionnaire dissemination. Instead of distributing surveys over the internet, future

researchers can do face-to-face questionnaire distribution. Therefore, while delivering questionnaires to potential responders, the researchers may describe the research goal in detail. Furthermore, some interaction between the researchers and the respondents might be beneficial in informing the respondents about what would be asked in the surveys.

CONCLUSION

In conclusion, this study has accomplished to discover the determinant of prevalence factors of mental health associated with adolescents. There are three independent variables, which are environmental, social, and economic, that have been chosen to examine their relationships with the dependent variable, which is the relationship of mental health among adolescents. A total of 401 respondents from the age of 17 until 25 years old were selected among adolescents in Kota Bharu, Kelantan, to examine their factors of mental health. Correlation coefficients have proved the result – Economy Factor (0.460), Social Factor (0.541), Environment Factor (0.373) and p-value equal to 0.000, which is less than alpha value 0.01, ($p < 0.01$). The results of the data indicate that all the independent variables (Economy Factor, Social Factor, and Environment Factor) significantly influence the mental health among adolescents.

ABSTRACT

Academic stress is one of the most common psychological variables used to assess teenager subjective well-being in educational settings. In the era of the pandemic, the problem of uncontrolled eating among student has become serious. This study aims to identify the components of academic stress and uncontrolled eating behaviour among university students in Kelantan. The components of academic stress are academic anxiety, academic pressure, academic frustration and academic conflict. There are 370 respondents from UiTM Machang and USM Kubang Kerian involved in answering the questionnaires distributed by the researcher. Data analysis was conducted by using SPSS. The findings have indicated a relationship between the components of academic stress and uncontrolled eating behaviour with a p-value less than 0.001. The results show that the relationship between the components of academic stress and uncontrolled eating behaviour is very significant. Based on the research findings, it is found that all research objectives were supported, and all hypotheses were accepted. The researchers have also proposed a few recommendations related to the study.

Keywords: Academic Stress, Uncontrolled Eating Behavior, Academic Anxiety, Academic Pressure, Academic Frustration, Academic Conflict

INTRODUCTION

According to Mustelin, Bulik, Kaprio and Keski-Rahkonen (2017), uncontrolled eating behavior can be associated with a person's weight gain in general. Uncontrolled eating will make a person more likely to over eat thus bringing harm to the body in the future (Bongers & Jansen, 2016). Emotions also play an important role in life in suppressing feelings to keep eating behaviour under control. Therefore, this study focuses on students of UiTM Machang and USM Kubang Kerian in Kelantan to find out statistics on academic stress and uncontrolled eating behaviour faced by the students. This is because students do experience academic stress while studying due to unstable mental state.

Academic stress has four components namely academic anxiety, academic pressure, academic frustration and academic conflict (Bisht, 1989). Students can experience this academic stress with various factors such as an unconducive learning environment and other learning-related problems. The World Health Organization (WHO) (2019) has defined stress as stress that does not match the knowledge and abilities of an individual who challenges the ability to cope.

This study consists of four objectives:
1. To identify the relationship between academic anxiety and uncontrolled eating behaviour among university students in Kelantan.

2. To determine the relationship between academic pressure and uncontrolled eating behaviour among university students in Kelantan.
3. To examine the relationship between academic frustration and uncontrolled eating behaviour among university students in Kelantan.
4. To identify the relationship between academic conflict and uncontrolled eating behaviour among university students in Kelantan.

Significance of the Study

University Students

This study is important to benefit university students on the academic stress experienced by many university students due to academic anxiety, academic pressure, academic frustration and academic conflict that can affect the performance and health of students in carrying out daily activities. This is because university students come from various backgrounds that can affect daily life and the learning process at university. This research can help students become active students and good at managing stress related to learning, personal and so on.

Parents

This study can provide some information to parents to be more sensitive and always pay attention to their children to avoid academic stress while studying at school or studying online at home. Therefore, parents need to provide a healthy and balanced diet so that children are more focused on carrying out activities and learning. In addition, parents can also spend time together in order to stabilise the children's emotions in order to make relevant decisions in completing tasks.

Society

This study is also expected to provide awareness to the community about the academic stress experienced by many individuals, especially students. Therefore, the surrounding community needs to encourage and encourage students to learn well. For example, village heads need to hold activities that can relieve stress due to academic anxiety, academic pressure, academic frustration and academic conflict. Indirectly, students are able to produce happy feelings and are able to complete learning -related tasks well.

University

This study can benefit every university in Malaysia in preventing and producing solutions for students who suffer from increasing academic stress and uncontrolled eating behaviour. This is because university students have a lot of assignments that need to be completed and do not manage time well, which can cause students to experience stress. Therefore, the university needs to provide a conducive learning space to give students peace of mind to learn, especially in online classes.

LITERATURE REVIEW

Academic Anxiety

Academic anxiety often occurs among university students because of having excessive anxiety about academic matters that distract students' focus and attention. Thus, academic anxiety that occurs to students can eliminate their motivation to study and make it difficult to achieve academic excellence (Rimonda, Bulantika, Latifah & Khasanah, 2020). Academic anxiety can also occur due to students' stress in relation to school work. Academic anxiety can cause psychological health to be affected and disrupt abilities, competencies, personality formation and even social identity.

Anxiety can be divided into two types, namely anxiety disorders in the form of acute stress and pathological anxiety of the mood. This is due to the use of unexpected threats in the academic field. Anxiety is fear about what is uncertain or will happen. Anxiety can disrupt a person's life if precautions are not taken. According to Hasty, Malanchini, Shakeshaft, Schofield, Malanchini and Wang (2020), academic anxiety hinders students' opportunities to learn and progress. Students with high academic anxiety will experience rapid heartbeat, panic, sweating and many more (Alizamar & Asri, 2017).

Academic Pressure

According to Durrette (2020), academic pressure is a term that has been described formally as an experience in which a student is burdened by time and energy demands to accomplish certain academic goals. Many university students experience cultural shocks and academic challenges because of the differences while studying at the school level. Additionally, there are students from various states studying at the same university with different cultural backgrounds.

According to Thakkar (2018), academic pressure can arise from familial expectations, lofty objectives established by individuals, or obligations imposed by society at large. Coaches and school authorities may also push student to achieve something. Whatever the cause of academic pressure, the consequences can be damaging to one well-being on a variety of levels (Thakkar, 2018).

Academic Frustration

Academic frustration can be defined as a learning theory in which learning discrimination occurs, affecting a person's persistence to learn and behaviour conceptualisation (Amsel, 1992). A person who suffers from academic frustration will cause daily activities to be disrupted. This is because students cannot live a normal life due to financial problems, family issues, and the environment that disturbs the students' peace. Academic frustration can influence students' eating behaviours, which can cause students to consume unhealthy food, thus leading to depression (Kennedy & Ivanov, 2020).

A person experiencing academic frustration can worse their mental health and cause academics and daily activities to be impaired (Levine et al., 2021). As a result, many students experience uncontrollable psychological and emotional disorders while studying at university due to the inability to solve problems properly and lacking support from those around them.

Academic Conflict

Academic conflict occurs when personal interests exceed professional obligations. Conflict is a perception that positively or negatively impacts people when communicating. Conflicts that occur can lead to fights and violence involving the community. Students who are unable to work together in a team can cause conflict. Academic conflicts have many disadvantages as they will be burdensome when students cannot complete assignments on time. Indirectly, it can affect the academic performance of a student.

Uncontrolled Eating Behavior

Uncontrolled eating can be defined as a person's tendency to eat excessively and not control daily food intake. A person who does not control their diet has a high chance of having an obese weight, thus affecting health and daily activities. Other than that, the most notable uncontrolled eating behaviours can be seen as eating too fast, eating even when they are not hungry, not following a meal schedule and many more. Several factors can be associated with uncontrolled eating behaviours, such as demographic, behavioural, social and industrial economic factors (Bahaman et al., 2017).

Research Hypotheses

In this study, the following four hypotheses have been demonstrated based on the objectives of the study:

- H1   There is a relationship between academic anxiety and uncontrolled eating behaviour among university students in Kelantan.
- H2   There is a relationship between academic pressure and uncontrolled eating behaviour among university students in Kelantan.
- H3   There is a relationship between academic frustration and uncontrolled eating behaviour among university students in Kelantan.
- H4   There is a relationship between academic conflict and uncontrolled eating behaviour among university students in Kelantan.

Research Framework

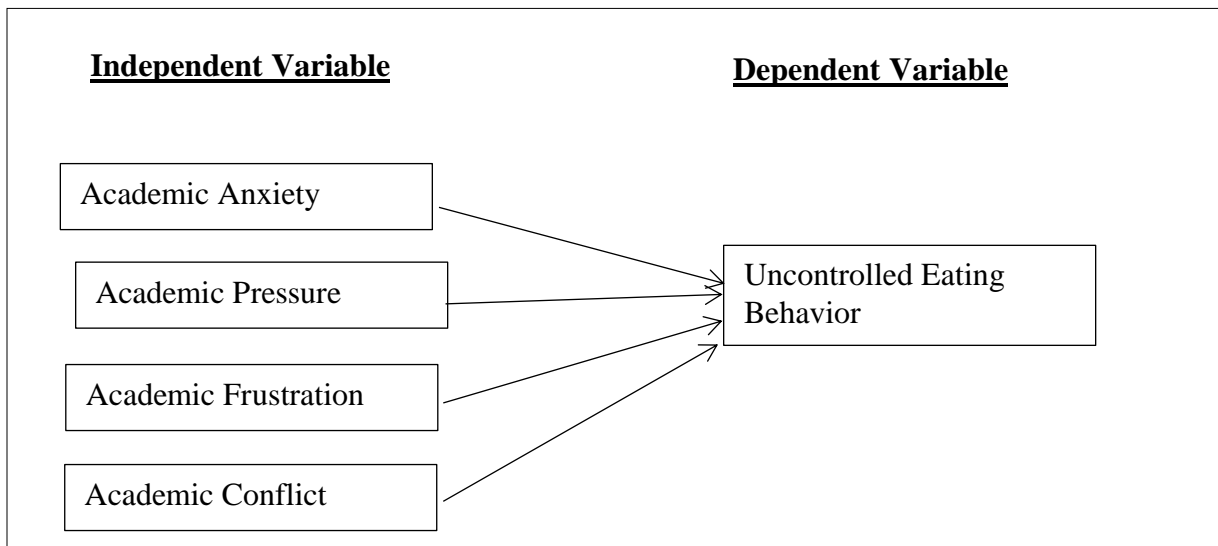
A research framework has been developed to investigate the connection between the research variables. The dependent variable of the study includes uncontrolled eating behaviour among university students in Kelantan, while the independent variables include academic stress, which are academic anxiety, academic pressure, academic frustration and academic conflict.


Figure 1: Research Framework

METHODOLOGY

Research Design

The researcher has utilised the quantitative research approach to collect data using the academic stress questionnaire from university students in Universiti Teknologi Mara (UiTM) Machang and Universiti Sains Malaysia (USM) Kubang Kerian. The quantitative approach is the process of collecting and analysing numerical data. It can be used to find the patterns and averages, make predictions, test causal relationships and generalise results to wider populations. This is because the quantitative approach strategy can assist in analysing continuous and distinct numerical data. This study focuses on descriptive research. According to Nassaji (2015), the descriptive research is a phenomenon, a current condition, and the features of a community of organisations and people. Descriptive research is a study that is employed to describe a population characteristic.

Data Collection

Data collection is the efficient approach to assembling and measuring the information from an assortment of sources in order to get a comprehensive and accurate data. In the first stage, this study has involved primary data collection using questionnaires via Google Forms, which were distributed to 370 respondents who participated in this study. The respondents from UiTM Machang Campus and USM Kubang Kerian Campus have answered the questions related to the relationship between academic stress and uncontrolled eating behaviour among university students in Kelantan. Google Form questionnaire is suitable for this study because everyone uses a smartphone nowadays.

Sampling

In this study, the researchers have selected non-probability sampling technique, the snowball sampling technique. Non-probability is a sampling technique in which the researcher chooses samples from the subjective assessment of the researcher instead of from a random point of view (Schuurman, 2020). In this research, researchers have distributed the questionnaire to one student, and the student needs to pass it to other students in their universities. Furthermore, the snowball sampling approach used in this study was chosen because it has the potential to save both time and money when it comes to data collection.

Data Analysis

The tool employed in analysing the data is a statistical tool or Statistical Package Social Science (SPSS), programmed version 25. SPSS data will be interpreted into statistics such as valid percentage and cumulative percentage. The researcher has chosen a simple descriptive analysis to evaluate the data. A frequency distribution is a mathematical distribution whereby one variable is considered simultaneously. The researcher has used this method because it is easy to understand and analyse.

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of the frequency analysis for this research.

Table 5: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	114	30.8
Female	256	69.2
Age		
19 -21 years old	91	24.6
22 -24 years old	262	70.8
25 years old and above	17	4.6
Race		
Malay	348	94.1
Chinese	5	1.4
Indian	17	4.6
Study Place (University)		
UiTM Machang Campus	225	60.8

USM Kubang Kerian Campus	145	39.2
Faculty		
Faculty of Accountancy	54	14.6
Faculty of Administrative Science and Policy Studies	16	4.3
Faculty of Art and Design	38	10.3
Faculty of Business and Management	55	14.9
Faculty of Computer and Mathematical Sciences	43	11.6
Faculty of Information Management	19	5.1
Faculty of Medical Science	17	4.6
Faculty of Dental Science	42	11.4
Faculty of Health Science	86	23.2

Table 1 shows the frequency analysis characterisation of respondents. 114 out of 370 respondents are male which represents 30.8% of the total of sample, while 256 respondents are female, representing 69.2% of the total of sample. 91 (24.6%) respondents are 19 - 21 years old. While the majority respondents are in the age range of 22 - 24 years old, which are 262 (70.8%) respondent and only 17 (4.6%) respondents are reported to be at the age of 25 years old and above. The majority of respondents' race is from Malay, 348 (94.1%). For Chinese, there are only 5 (1.4%) respondents, while for Indians, the number of respondents is 17 (4.6%). For UiTM Machang Campus, there are 225 (60.8%) respondents, while in USM Kubang Kerian Campus are 145 (39.2%) respondents. For the Faculty of Accountancy, there are 54 (14.6%) respondents, while for the Faculty of Administrative Science and Policy Studies, the number of respondent is 16 (4.3%). For the Faculty of Art and Design, there are 38 (10.3%). Besides, the Faculty of Business and Management, the Faculty of Computer and Mathematical Sciences and the Faculty of Information Management respondents consist of 55 (14.9%), 43 (11.6%) and 19 (5.1%) respectively. There are 17 (4.6%) respondents in the Faculty of Medical Science, 42 (11.4%) respondents in the Faculty of Dental Science, and the majority respondents in the Faculty of Health Science, which are 86 (23.2%) respondents.

Result of Descriptive Analysis

Table 2 shows the result of the descriptive analysis of this research.

Table 6: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Academic Anxiety	I am anxious that other students may exceed me in my studies.	3.58	0.740
	I feel sad when I cannot recall the lessons learned when it is required.	3.70	0.510
	I am always anxious that the lecturer may ask any question which I cannot answer.	3.61	0.585
	I feel afraid of what will happen if I fail the exam.	3.56	0.534
	I am always afraid of falling sick during an examination period.	3.56	0.661
	I am afraid of the word "examination".	3.55	0.750
	I am always afraid that the lecturer may ask about assignments.	3.57	0.734
Academic Pressure	I consider studying as a burden.	2.79	0.952
	The extreme work done to secure a high grade in the examinations makes me tired.	3.40	0.787

	I feel angry when lecturers give extra assignments during holidays.	3.46	0.736
	I like vacation because I can get rid of my studies.	3.26	0.889
	I get a headache due to thinking about my studies.	3.26	0.778
	I feel at ease when lecturers fail to come to class.	3.23	0.799
	I get a sigh of relief when my class is over.	3.40	0.627
	I feel tired of answering questions in my studies.	3.28	0.760
	I think that at my university, they teach more than required.	3.36	0.809
Academic Frustration	I am sad that I am not good at studying like other students.	3.62	0.681
	It makes me frustrated when I see my lecturer only impressed with a few students.	3.55	0.721
	I feel frustrated because my examination results are not up to my expectations.	3.51	0.668
	I feel embarrassed with my classmates for not being able to answer questions asked by the lecturer.	3.45	0.662
	I feel jealous of the bright students in my class.	3.44	0.734
	I feel frustrated that in spite of studying hard, I could not get first place in class.	3.48	0.683
	I feel jealous when I see other students' study-related equipment facilities.	3.36	0.805
	I feel sorry that I could not focus on my studies and wasted my time on worthless activities.	3.54	0.650
Academic Conflict	In spite of knowing that cheating is wrong, I still copy in the examinations.	3.29	0.908
	I am in a dilemma due to the differences in my desires and my parents' desires in study-related matters.	3.36	0.868
	My attention gets diverted when I try to focus on my studies.	3.31	0.745
	I keep on thinking about whether I should continue to study or not.	3.31	0.832
	I like going to class, but I avoid it because of the fear of studying.	3.11	0.927
	I am in a dilemma, whether to do revision or not after seeing those who revised and scored good marks.	3.40	0.814
	I have difficulties deciding how much time I should allocate for my studies.	3.46	0.751
Uncontrolled Eating Behavior	Sometimes when I start eating, I just cannot seem to stop.	3.52	0.683
	Being with someone who is eating, makes me feel like eating too.	3.58	0.603
	When I see a real delicacy, I will hungry and eat right away.	3.46	0.642
	I get so hungry that my stomach often growls.	3.39	0.710

I would not stop eating until I finished the food on my plate.	3.45	0.662
I am always hungry which I feel like eating all the time.	3.32	0.773
I do binge eating, although I am not hungry.	3.32	0.853

Table 2 shows the descriptive analysis of the components academic stress and uncontrolled eating behaviour. Mean and standard deviation for the items was utilised to measure academic anxiety. The mean range for academic anxiety ranges from 3.55 – 3.70, and the standard deviation is from 0.510 - 0.750. Seven (7) questions were measured with the highest mean of 3.70 agree for item AA2 with the statement 'I feel sad when I cannot recall the lessons learned when it is required.' On the other hand, the lowest mean with 3.55 for item AA6, with the statement 'I am afraid of the word 'examination'.' The mean values for other five (5) items for AA1, AA3, AA4, AA5 and AA7 are 3.58, 3.61, 3.56, 3.56 and 3.57, respectively.

Besides, the mean range for academic pressure is from 2.79 – 3.46, and the standard deviation is from 0.627 – 0.952. Nine (9) questions have indicated the highest mean of 3.46 implied by the item AP3 with the statement 'I feel angry when lecturers give extra assignments during holidays'. Meanwhile, the lowest mean with 2.79 is for item AP1, which agrees with the statement 'I consider study as a burden.' The mean values for other seven (7) items of AP2, AP4, AP5, AP6, AP7, AP8 and AP9 are 3.40, 3.26, 3.26, 3.23, 3.40, 3.28 and 3.36, respectively.

Next, the mean ranged for academic frustration is from 3.36 – 3.62, and the standard deviation is from 0.650 – 0.805. Eight (8) questions have indicated the highest mean of 3.62, with AF1 indicating the statement 'I feel very sad that I am not good in studies like other students.' In the meantime, the lowest mean with 3.36 is for item AF7, which is in line with the statement 'I feel jealous when I see other students' study-related equipment facilities.' The mean values for the other six (6) items of AF2, AF3, AF4, AF5, AF6 and AF8 are 3.55, 3.51, 3.45, 3.44, 3.48 and 3.54, respectively.

Besides, the mean range for academic conflict is from 3.11 – 3.46, and the standard deviation is from 0.745 – 0.927. Seven (7) questions are measured with the highest mean of 3.46 agree for the item AC7 on the statement 'I have difficulties in deciding how much time I should allocate for my studies.' Meanwhile, the lowest mean of 3.11 is for item AC5, which agrees with the statement 'I like going to class, but I avoid it because of the fear of studying.' The mean values for other five (5) items of AC1, AC2, AC3, AC4 and AC6 are 3.29, 3.36, 3.31, 3.31 and 3.40, respectively.

Lastly, the mean range for uncontrolled eating behaviour is from 3.32 - 3.58, and the standard deviation is from 0.603 – 0.853. There are seven (7) questions measured with the highest mean of 3.58 following the item U2 on the statement 'Being with someone who is eating, often makes me feel like eating too.' Meanwhile, the lowest mean with 3.32 is for the items of U6 and U7 on the statement that 'I am always hungry which I feel like eating all the time and 'I binge eat though I am not hungry.' The mean values for other five (5) items for U1, U3, U4 and U5 are 3.52, 3.46, 3.39 and 3.45, respectively.

Result of Reliability Analysis
Table 3 shows the result of the reliability analysis of this research.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha

Academic Anxiety	7	0.721
Academic Pressure	9	0.918
Academic Frustration	8	0.860
Academic Conflict	7	0.909
Uncontrolled Eating Behavior	7	0.817

Table 3 shows the reliability analysis of the four variables of uncontrolled eating behaviours. The reliability Cronbach's alpha coefficient value for academic anxiety is 0.721, which is acceptable and academic frustration is 0.860, which indicates a good level. In contrast, the reliability of Cronbach's alpha coefficient value of academic conflict and academic pressure has indicated the highest score, which is 0.909 and 0.918 indicating excellent reliability. However, the uncontrolled eating behaviour is 0.817, which indicates good reliability.

Result of Pearson Correlation Analysis

Table 4 shows the result of the pearson correlation analysis of this research.

Table 7: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported / Not Supported)
H1: There is a relationship between academic anxiety and uncontrolled eating behaviour among university students in Kelantan.	0.684	H1 is supported
H2: There is a relationship between academic pressure and uncontrolled eating behaviour among university students in Kelantan.	0.741	H2 is supported
H3: There is a relationship between academic frustration and uncontrolled eating behaviour among university students in Kelantan.	0.733	H3 is supported
H4: There is a relationship between academic conflict and uncontrolled eating behaviour among university students in Kelantan.	0.769	H4 is supported

Table 4 shows the pearson correlation analysis of the relationship between independent variables and dependent variable accordingly. Overall, all the relationship between the variables were significant positively correlated. The relationship between academic anxiety and uncontrolled eating behaviour among university students in Kelantan has a significantly moderate positive correlation with 0.684. This implies that the relationship between academic anxiety and uncontrolled eating behaviour among university students in Kelantan is positively related among students. The relationship between academic pressure and uncontrolled eating behaviour among university students in Kelantan is high positive correlation with a correlation coefficient of 0.741. This implies that the relationship between academic pressure and uncontrolled eating behaviour among university students in Kelantan is positively related. Besides, the relationship between academic frustration and uncontrolled eating behaviour among university students in Kelantan is significantly high positive correlation with 0.733. This implies that the relationship between academic frustration and uncontrolled eating behaviour among university students in Kelantan is positively related. Lastly, the relationship between academic conflict and uncontrolled eating behaviour among university students in Kelantan is significantly high positive correlation with 0.769. This implies that the relationship between academic conflict and uncontrolled eating behaviour among university students in Kelantan is

positively related. All the significant positive relationships have indicated that respondents are well- accepting components of academic stress and uncontrolled eating behaviour.

DISCUSSION AND RECOMMENDATION

This study only discusses some factors on the relationship between academic stress and eating disorders among university students at UiTM Machang and USM Kubang Kerian. Therefore, researchers have studied factors such as academic frustration, academic anxiety, academic pressure and academic conflict. The results of the analysis of the study would indicate the number of students in the university who experience academic stress. For suggestions, future studies could use other variables that can reduce the burden of university students on academic stress, such as academic performance. For example, improving the academic performance of students in a medical university is crucial to creating a quality doctor in the future and increasing the level of depression will affect the performance of students in the university (Yumashev et al., 2018). Thus, the variables of the previous study were related to the recommendations given by the researchers.

Future researchers could use this topic to create future studies to show the relationship between academic stress that occurs among students. Researchers hope that future studies will maintain the method of collecting data quantitatively from the intended respondents. This is because, researchers have selected the population among university students at USM Kubang Kerian as many as 3678 students and UiTM Machang, as many as 7729 students located in Kelantan. Therefore, the data were collected using an online questionnaire method to prevent the spread of the Covid-19 outbreak. Research done in the future is highly encouraged to use this method because researchers have now successfully conducted this study. Throughout the data collection, the researchers found that respondents were more inclined to fill out online questionnaires than the written questionnaires and in-person interviews that were commonly done by previous researchers.

In addition, researchers can also use various languages such as Mandarin and Tamil in future questionnaires. This is because most researchers only use English and Malay to conduct the questionnaire. It could make it easier for Chinese and Indians to understand the questions given and not cause stress when answering the questionnaire by the respondents. Indirectly, researchers can further increase the level of foreign languages to make it easier to communicate between races.

CONCLUSION

The main purpose of this research is to examine the relationship between academic stress and uncontrolled eating behaviour among university students in Kelantan. According to the result, academic anxiety, academic pressure, academic frustration and academic conflict are independent variable caused influences on the dependent variable, which is uncontrolled eating behaviour. Chapter 3 also mentioned the total numbers of 370 respondents were administered among the university students in UiTM Machang and USM Kubang Kerian. The population of respondent were students of UiTM Machang and USM Kubang Kerian. Next, Chapter 4 indicates the results from the questionnaire survey that was analysed using descriptive and inferential analysis. The data obtained from the questionnaire has been evaluated by software program, namely Statistical Package for the Social Science (SPSS). Lastly, Chapter 5 summarises the results based on the data analysis. Thus, all the hypothesis such of H1, H2, H3 and H4 are accepted.

ABSTRACT

Psychological well-being encompasses both positive and negative feelings, such as frustration, disappointment, and loss, which are all-natural parts of life. Meanwhile, emotional intelligence helps an individual success in their life, maintain healthy relationship with family and friend. This study aims to identify the relationship between emotional intelligence and psychological well-being among Universiti Pendidikan Sultan Idris (UPSI) students. The components of emotional intelligence are self-awareness, self-management, social awareness and relationship management. There were 375 respondents participated in this study. This study focused on the relationship between emotional intelligence and psychological well-being among students in UPSI. The results of the research data were obtained from 375 respondents from UPSI. Data analysis was conducted by using SPSS. The finding has indicated a relationship between the component of emotional intelligence and psychological well-being with a p-value less than 0.001. The results show that the relationship between component of emotional intelligence and psychological well-being are significant. Based on the research finding, it is found that all research objectives were supported and all of hypothesis were accepted. The researchers have also proposed a few recommendations related to the study.

Keywords: Psychological Well-Being, Emotional Intelligence, Self-Awareness, Self-Management, Social Awareness and Relationship Management.

INTRODUCTION

Psychological well-being is very important in the lives of every individual. According to Runi, Vescovelli, Carpi and Masoni (2017), stated that well-being has a positive relationship and positive emotions. According to Chen, Hua, Yu, Wang and Ulrich (2017) psychological well-being among students has a positive influence on students' mental and physical health. High positive rate can lower negative emotional states, (Sánchez-Álvarez, Extremera, & Fernández-Berrocal, 2016). By having high psychological well-being, students can complete their homework, improve academic achievement and carry out learning activities better (Navale, 2018). It is clear that the well-being of psychology is very important to students.

According to Goleman (1995), Emotional intelligence is more essential than intellectual intelligence because, in comparison to intellectual intelligence, an individual emotional intelligence is a more important element in determining their success. This clearly shows that emotional intelligence is very important in every individual, especially students. Good emotions can help students in doing wise actions. Furthermore, research on emotional intelligence and joint fitness shows that self-management and self-awareness are important but not sufficient for relationship management and social awareness (Furlong, You, Shishim, & Dowdy, 2016)

This study consists of four objectiv
1. To investigate about the relationship between self-awareness and psychological well-being among students in UPSI.
2. To examine the relationship between self-management and psychological well-being among students in UPSI.
3. To identify the relationship between social awareness and psychological well-being among students in UPSI.
4. To identify the relationship between relationship management and psychological well-being among students in UPSI.

Significance of the study

Academic Institutions and Administrators

Academic institutions and administrators might use the findings of this study to better understand and identify the association between emotional intelligence and psychological well-being among university students. This study can be utilized as a guide and resource for academic institutions and administrators looking to implement strategies such as running programs or advocating for students' emotional intelligence and psychological well-being. This is because university students must manage their emotions and maintain their psychological well-being to create a positive and healthy mental and physical learning environment.

University Students

Students will immediately benefit from this study since the findings may help them to better control their emotions. They can be kept from doing negative things if they have good emotional management. Students can learn from this research that having a stable emotional intelligence will help them achieve in life and maintain healthy connections with others around them.

Community

This study spread awareness to the community about recognizing the psychological well-being of something important in their daily lives. This is because a community with a good level of psychology can reduce crime cases in the country and can be a good example for the younger generation, especially students to take wise action before doing something. Psychological well-being is the emotional health associated with positive relationships between individuals with other individuals. This means that if a person's psychological well-being is in a good state, then this can manifest positive feelings towards the individual with other individuals.

Future Researcher

The results of this study will serve as a guide and resource for future research on emotional intelligence in students. Other researchers can improve this study, as well as reorganize old studies to be utilized as new studies. More research is being carried out to gain a better idea of the scope of the investigation.

LITERATURE REVIEW

Psychological Well-Being

Psychological well-being encompasses both positive and negative feelings, such as frustration, disappointment, and loss, which are all-natural parts of life. As a result, regulating negative emotions is critical for long-term happiness. According to Hernandez, Bassett, Schuette, Shiu

and Moskowitz (2018), psychological well-being is defined as a set of pleasant situations in all aspects of life, such as contentment, physical and spiritual well-being, and optimal function. It also refers to how people manage their lives and activities.

According to the theory of psychological well-being, an individual psychological health is measured by how well they operate in particular elements of life (Udhayakumar, 2018). Psychological well-being has a good function in individual health psychology to make an individual can determine a aspect in their life. Psychological well-being plays a good support in a fundamental in student by building a positive emotional. Students will be having a positive role in their psychological well-being because students can control an emotion with positive emotion to create by building a support play. High psychological distress and low psychological well-being are two classifications that can be used to describe university students who are suffering from a high level of mental disease (Sharp & Theiler, 2018).

Emotional Intelligence

Emotional intelligence is about own feeling and having the power to handle those feelings, having the flexibility to motivate ourselves to induce jobs done, be creative and perform at the best level, be sensitive and prepare to handle relationships effectively (Goleman, 1997). According to Goleman (1998), an emotionally intelligent individual is capable of distinguishing between various emotions and formulating a precise and effective response in a variety of settings and scenarios. Being a skill, emotional intelligence may also define as the capacity to sense, analyse, use, and control emotions effectively, as well as a personality trait (Goleman, 1995).

According to Bar-On (2002), to be more successful in handling environmental demands, emotional intelligence is defined as understanding oneself and others, relating well to people, and adjusting to and coping with one immediate surroundings Emotional and social intelligence must be defined as a set of interconnected emotional and social skills that influence how well people comprehend and express themselves, how effectively people understand and express themselves, how well people understand and relate to others, and how well people deal with daily demands and stresses. Emotional intelligence was divided into four (4) components which is self-awareness, self-management, social awareness and relationship management (Goleman, 2001).

Self-Awareness

Self-awareness is one of the components emotional intelligences that proposed by Goleman (2018). Self -awareness is very important for every individual including teenagers. This is because, adolescents now need to have awareness in each other because adolescence is now known as the bio-psycho-social phase of so that self-awareness is the pathway to adolescent high potential for self -growth and future development (Kalaiyasaran & Solomon, 2016). Individuals will also fail to control themselves when doing something if they have a lack of self -awareness. Therefore, each individual should not neglect self-awareness as this can help the individual in controlling themselves, can establish relationships with other individuals and help the individual in making decisions especially scales for students. This clearly shows that self - awareness is very important in every student.

Self-Management

Self-regulation or self-management it is the ability to manage one's emotions or control one's disturbing impulses and moods in the presence of others and in different situations (Dangmei & Singh, 2017). Besides, self-management or self-regulation, one of the dimensions to

Goleman's emotional intelligence, refers to the ability to suppress one's emotions and impulses, stay calm in an unhealthy situation and stay calm regardless of one emotion (Ikpesu, 2017). Students that have a self-regulator or self-management are someone who is motivated to achieve success on a task, set realistic goals for the task, uses specific strategies to achieve those goals, conduct self-assessment to evaluate the effectiveness of its strategy, and adjust its performance strategy to ensure success.

Social Awareness

The concept of social awareness is that the power to acknowledge, understand, and react to others' emotions while understanding social networks (Goleman, 1998). According to Goleman (2006), social awareness emphasises an individual's ability to recognise, perceive and react to other people's emotions while being a part of the social network circuitry, and it is that ability to grasp and be compassionate to other people's emotions, views, opinions and challenges of others. The components of social awareness competence are primal empathy, service orientation and organizational awareness are all components of social awareness competence (Goleman, 2001). Communication is the basis of any relationship, and it will be within the sort verbal, nonverbal, communication, and eye contact, all of which come to an end throughout the course of a relationship.

Relationship Management

Students that have good relationship management skills can regulate their self- awareness and psychological control in every setting. Being self-conscious, managing self, and being aware of situations and others in those contexts entailed relationship management in order to maintain cordial, productive relationships throughout time (Arora, Ashrafian, Davis, Athansiou, Darzi & Sevdalis, 2010). Relationship management or social skills help a person to manage the relationship with others and also relationship management or social skills can build a system which is can call a people skill (Schuetz, 2011). Students having a social skills or relationship management easy to create a tolerance, communication, empathy and others. According to Goleman (1995), meanwhile having a tolerance and empathy, relationship management or social skills also can be an effective in leading teams and can manage a time.

Research Hypothesis

In this study, the following four hypothesis were indicated based on the research objectives:
H1 There is a relationship between self-awareness and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI).
H2 There is a relationship between self-management and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI).
H3 There is a relationship between social awareness and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI).
H4 There is a relationship between relationship management and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI).

Research Framework

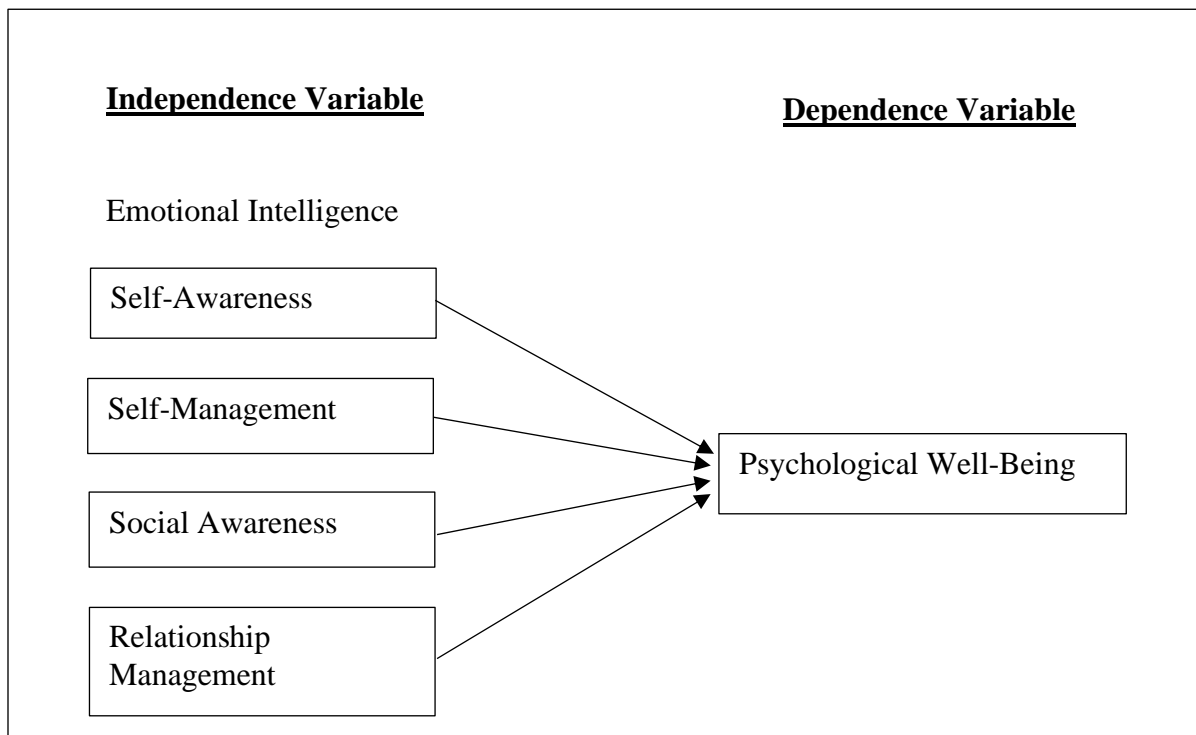
A research framework has been established based on the literature review in order to examine the association between emotional intelligence and psychological well-being among students at Universiti Pendidikan Sultan Idris (UPSI). The figure 1 shows the research framework use for this study.


Figure 1:Research Framework

METHODOLOGY

Research Design

To acquire results, this study has applied quantitative research methods to collect data from the respondents which are students of Universiti Pendidikan Sultan Idris (UPSI). The quantitative method entails quantifying and evaluating variables. It comprises the use of numerical data and the analysis of that data using specific statistical methodologies to answer questions like who, how much, what, where, and when. It also describes methods of explaining a problem or phenomenon by collecting data in digital form. This study further shows that quantitative methods can be categorized as follows research design, correlation studies, empirical studies, and comparative causal studies (Apuke, 2017). On the other hand, descriptive research can determine the answer to the what, who, where, when, and how of a selective situation or problem. But specifically, descriptive research has two types of research design which are a longitudinal study and a cross-sectional study. This study will apply a cross- sectional study to identify the relationship between emotional intelligence and psychological well-being among UPSI students.

Data Collection

The data collection was conducted using questionnaires. In this study, the researcher will use primary data to collect information. Researchers will use a questionnaire containing demographics and questionnaires about emotional intelligence and psychological well -being. Questionnaires will be provided through google forms as this will make it easier for respondents to answer questions online. By using snowball techniques, questionnaires will be distributed to students at Universiti Pendidikan Sultan Idris through digital platforms such as WhatsApp, Telegram, and Instagram, which were distributed to 375 respondents who participated in this study.

Sampling

In this research, the researchers selected a non-probability sampling technique which is snowball sampling. According to Taherdoost (2017), non-probability sampling is a sampling method in which the researcher selects a sample based on subjective evaluation rather than random selection. It is a sampling procedure during which not all individuals of the population have an equal chance of participating within the research. A snowball sampling is a non-probability sampling method in which the samples contain difficult-to-detect characteristics.

Data Analysis

There were four types of data analysis used in this study, namely frequency analysis, descriptive analysis, reliability test and Pearson correlation analysis. The data obtained was analysed by using SPSS version 26 to show the relationship between the dependent variable and the independent variables. SPSS data will interpret into statistics such as valid percentage and cumulative percentage. The presentation of data will be supported by the illustration of tables, charts, and graphs.

FINDINGS

Results of Frequency Analysis

The Table 1 below shows the result of frequency analysis of this research.

Table 8: Frequency Analysis

Characteristic	Frequency	Percentage
Gender		
Male	121	32.3
Female	254	67.7
Age		
20 -22 years old	139	37.1
23 -25 years old	211	56.3
26 years old and above	25	6.7
Race		
Malay	298	79.5
Chinese	32	8.5
Indian	26	6.9
Others	19	5.1
Study Place (University)		
UPSI Campus Sultan Abdul Jalil Shah, Tanjong Malim	222	59.2
UPSI Campus Sultan Azlan Shah, Proton City	153	40.8
Faculty		
Faculty of Language and Communication	91	24.3
Faculty of Music and Performing Arts	29	7.7
Faculty of Management and Economics	37	9.9
Faculty of Human Development	72	19.2
Faculty of Humanities	49	13.1
Faculty of Computer Arts and Creative Industries	29	7.7
Faculty of Science and Mathematics	34	9.1
Faculty of Sports Science and Coaching	15	4.0
Faculty of Vocational Technical	19	5.1

Table 1 shows the frequency analysis characteristic of respondent. The gender distribution of a total of 375 respondents. The female respondents were 67.7 percent (n=254) more than male

respondents' 32.3 percent (n=121). Next is age, it has been divided into 3 category which is category 1 are student among 20-22 years old. Among these three age groups, this category was highest number of respondents with 56.3 percent (n = 211). The second category is students are among 20 to 22 years old with 37.1 percent (n = 139). While the lowest number of respondents were from the age 26 years old and above with 6.7 percent (n = 25). For races, it has been categorized into main 3 different races and there are also some other religions such as Iban, Dusun, Bajau and so on but the researcher has combined them in one category. Based on the table, the highest number of respondents are Malay which consisted 79.5 percent (n = 298) respondents. Then followed by Chinese which consisted 8.5 percent (n = 32) respondents and then India which consisted 6.9 percent (n = 26)   while 5.1 percent (n = 19) of them from other races had responded to the questionnaire.

For study place (campus) shows that UPSI Campus Sultan Abdul Jalil Shah, Tanjong Malim respondents were 59.2 percent (n = 222) more than UPSI Campus Sultan Azlan Shah, Proton City respondent 40.8 percent (n = 153). The last one is faculty, Among the nine faculty, Faculty of Language and Communication (FBK) recorded the highest number of respondents at 24.3 percent (n = 91). The second highest is Faculty of Human Development (FPM), recorded 19.2 percent (n = 72). Next, Faculty of Humanities (FSK) at 13.1 percent (n = 49). Meanwhile, Faculty of Music and Performing Arts (FMSP) and Faculty of Computer Arts and Creative Industries (FSKIK) recorded the same total frequency and percent which is 7.7 percent (n = 29). For the Faculty of Management and Economics (FPEK) by 9.9 percent (n = 37) and Faculty of Science and Mathematics (FSMT) by 9.1 percent (n = 34). There are also faculty that recorded lowest number of respondents, the Faculty of Vocational Technical (FTV) by 5.1 percent (n = 19) and also Faculty of Sports Science and Coaching (FSSKJ) by 4.0 percent (n = 15).

Result of Descriptive Analysis

The Table 2 below shows the result of descriptive analysis of this research.

Table 9: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Self-Awareness	I have confidence in my abilities.	3.55	0.652
	I admit my weakness.	3.52	0.579
	I understand my emotions when I am facing certain situations.	3.43	0.633
	I am able to notice the impact of my behavior on others.	3.46	0.587
	I am aware when others influence the condition of my emotions.	3.45	0.614
	I have confidence in my abilities.	3.42	0.644
Self-Management	I can calm down when I am angry	3.38	0.761
	I can handle stress well	3.33	0.761
	I accept disappointment without feeling upset	3.10	0.867
	I will consider a few choices before making a decision	3.51	0.575
	I will do my best in every situation, whether the situation is good or bad.	3.53	0.550
	I will refrain myself from expressing anything that is not helpful in resolving specific problems.	3.46	0.627

Social Awareness	I accept criticism.	3.55	0.644
	I understand the feelings of others.	3.44	0.643
	I can easily adapt to any situations.	3.40	0.727
	I can accept others' opinion.	3.58	0.516
Relationship Management	I will show my concern for what others have to go through.	3.64	0.538
	I always avoid social situations.	2.43	1.090
	I can communicate clearly with others.	3.43	0.709
	I can get along well with others	3.41	0.656
	I resolve problems effectively.	3.35	0632
	To ensure effective interaction, I pay attention to others' feelings.	3.49	0.561
	I learn about others in order to interact with them better.	3.47	0.611
	I love telling others about myself.	3.08	0.935
Psychological Well-Being	When I look back on my life, I am happy with how things have changed.	3.57	0.612
	I am not afraid to voice out my opinions, even when my opinions were opposite to the other's opinions.	3.34	0.701
	I am good at juggling my time so that I can fit everything in that needs to get done	3.34	0.686
	I think it is important to have new experiences.	3.62	0.497
	I know I can trust my friends and they know they can trust me.	3.33	0.696

Table 2 shows the descriptive analysis for the component emotional intelligence and psychological well-being. The mean and the standard deviation for the items used to measure the emotional intelligence and psychological well-being. For self-awareness, there were six (6) questions measured with one (1) of the items having the lowest mean 3.42 for item SA6. Out of 375 respondents, 234 respondents (62.4%) responded strongly agreed on item SA1 with the highest mean, 3.55. Meanwhile, the mean for SA2, SA3, SA4, and SA5 were 3.52, 3.43, 3.46, and 3.45.

Next is self-management. There were six (6) questions measured with the highest mean of 3.53 for the item SM6. A total of 155 respondents (41.3%) were chosen agreed and 210 respondents (56%) were chosen strongly agreed on the item SM6. Meanwhile, the lowest mean was item SM4 with 3.10. The mean values for four (4) remaining items which SM1, SM3, SM5 and SM7 were 3.38, 3.33, 3.51 and 3.46 respectively.

There were four (4) questions of social awareness were measured with the highest mean of 3.58 for the item SCA4. There were a total 151 from 375 respondents (40.3%) responded agreed and a total 220 respondents (58.7%) responded strongly agreed with the item SCA4. Besides, the mean of 3.55 for the item SCA1 with 120 respondents (32%) were answered agreed and 232 respondents were answered strongly agreed to the item SCA1. The mean value for the other two (2) items, SCA2 and SCA3 were 3.44 and 3.40 respectively.

The last component of emotional intelligence is relationship management. There were eight (8) questions measured with the highest mean of 3.64 for the item RM1. A total of 115 respondents (30.7%) were chosen agreed and 251 respondents (66.9%) were chosen strongly agreed on the item RM1. Meanwhile, the lowest mean was item RM2 with 2.43. The mean values for six (6)

remaining items which RM3, RM4, RM5, RM6, RM7 and RM8 were 3.43, 3.41, 3.35, 3.49, 3.47 and 3.08 respectively.

For dependence variable which is psychological well-being, there were five (5) questions measured with one (1) of the items having the highest mean 3.62 for item PWB4. This has been proved a total number of 235 respondents (62.7%) strongly agreed and 138 respondents (36.8%) agreed on the items PWB4. However, item PWB6 has the lowest mean with 3.33. There was having the same mean 3.34 for items PWB2 and PWB3. The mean for PWB1 is 3.57, respectively.

There were some items that has been deleted which item SM2, SM8, SM9, SCA5 and PWB5, this item was deleted as a cut off point for acceptable value.

Results of Reliability Analysis

The Table 3 below shows the result of reliability analysis of this research.

Table 10: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Self-Awareness	6	0.757
Self-Management	6	0.789
Social Awareness	4	0.736
Relationship Management	8	0.713
Psychological Well-Being	5	0.716

Table 3, show the value of Cronbach Alpha for all variable were at an acceptable level (0.7). For independence variable, the emotional intelligence part was divided into 4 components. The first component is self-awareness. This component contains 6 items and was found to be acceptable. This variable is reliable in the strength of correlation (items 6: $\alpha = 0.757$). The next component is self-management. This component contains 6 items and was also found to be acceptable. This variable is also reliable in the strength of correlation (items 6: $\alpha = 0.789$). The next component of emotional intelligence is social awareness. There are 4 items for this component and found to be acceptable. This variable is reliable in the strength of correlation (items 4: $\alpha = 0.736$). The last component of emotional intelligence is relationship management. There are 8 items for this component and it found to be acceptable. The variable in the strength of correlation (8 items: $\alpha = 0.713$). For dependence variable that is psychological well-being, there are 5 items and the value of Cronbach Alpha is at a level of acceptable. This variable is reliable in the strength of Correlation (items 5: $\alpha = 0.716$).

Result of Pearson Correlation Analysis

Table 4 below shows the result of person correlation analysis of this research.

Table 411: Pearson Correlation Analysis

	Hypothesis	P-Value	Result (supported / Not Supported)
H1:	There is a relationship between self-awareness and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI).	0.621	H1 is supported
H2:	There is a relationship between self-management	0.601	H2 is supported

	and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI).		
H3:	There is a relationship between social awareness and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI).	0.537	H3 is supported
H4:	There is a relationship between relationship management and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI)	0.629	H4 is supported

Based on table 4, Pearson's correlation analysis was used to test the relationship between hypotheses on a significant relationship such as psychological well-being and four component of emotional intelligence which is self-awareness, self-management, social awareness and relationship management. Overall, all hypotheses were accepted at a 0.01 significance level. According to Schober, Boer, & Schwarte (2018), the table of Cronbach Alpha for all of the relationship between the variable were significantly moderate correlation. This implies that all the relationship between the variable were positively related.

DISCUSSION AND RECOMMENDATION

This study only discusses on the relationship between emotional intelligence and psychological well-being among students in Universiti Pendidikan Sultan Idris (UPSI), between the two campuses which are Campus Sultan Abdul Jalil Shah (KSAJS) and Campus Sultan Azlan Shah (KSAS). Therefore, the four components in emotional intelligence which are self-awareness, self- management, social awareness and relationship management.

First, rather than focusing solely on one university, future researchers may be able to widen the study area by collecting data on multiple campuses based on the variances in the courses registered. Furthermore, the data gathered will be more accurate in determining the impact of emotional intelligence on university students' psychological well-being. University students will learn how to handle emotions as a result of this study, ensuring that their psychological well-being is maintained.

Moreover, future researchers can also reproduce the journal by further refining previous studies. To help further improve reading resources, future researchers can search for journals in public libraries in addition to searching for journals on Google Scholar and my Athens to find more information from abroad about the relationship between emotional intelligence and psychological well -being among university students.

Lastly, future researchers are highly recommended to use language or questions that are easily understood by all respondents involved in the study conducted. Therefore, the questions asked must use language or questions that are easier to understand and clear. In surveys, language is used in a variety of ways, including words, symbols (such as arrows), and even emojis. Language users, such as survey respondents and interviewers, must converse in the same

language, both literally and metaphorically (Sha & Gabel, 2020). In addition, the questionnaire can be completed in a variety of languages, including Mandarin and Tamil. This multilingual skill can help people of many races and languages understand and answer the question without feeling pressured.

CONCLUSION

The main purpose of this study was to examine the relationship between emotional intelligence and psychological well-being among UPSI's students. According to the results, self-awareness, self-management, social awareness and relationship management are independent variables, and it is due to the influence on dependent variables which is psychological well-being. A total of 375 UPSI students has been taken as sample size to conduct this study. The respondents are students between the two campuses of Universiti Pendidikan Sultan Idris (UPSI) which are Campus Sultan Abdul Jalil Shah (KSAJS) and Campus Sultan Azlan Shah (KSAS) that have been selected to be the target population of this study as the respondents. Next, in chapter 4 were the findings of result from the questionnaires survey through google form that analyse using descriptive and inferential analysis. The data obtained from the questionnaire has been evaluated by software program using Statistical Package for the Social Science (SPSS). Lastly, in chapter 5 about summarization of the results based on data analysis. Thus, all the hypothesis such as H1, H2, H3 and H4 stated are accepted.

ABSTRACT

Mental health problems among university students are now an issue in many countries. Many students must face many challenges every day, and eventually, they are so depressed that some are willing to commit suicide for failing to overcome this mental health problem. This research was conducted to study the negative effects of Covid-19 on the level of education among university students at Universiti Malaysia Kelantan. Thus, 359 respondents among university students were randomly selected to complete the questionnaire. The questions focused on depression, anxiety and added stress in the online learning process. Furthermore, the questions also focus on which groups are most affected by mental health problems, such as ethnicity, gender, and socioeconomics. Since the university has decided to pursue distance learning, health professionals should provide the best support to students.

Keywords: Mental Health, University Students, Gender, Ethnicity, Socio-economic

INTRODUCTION

Coronavirus disease 2019 (Covid-19) is a disease caused by a novel coronavirus known as severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2; formerly known as 2019nCoV), which was first discovered in Wuhan City, Hubei Province, China, during a respiratory illness outbreak (Cennimo, 2021). The World Health Organization received the first notification on December 31, 2019. (WHO). On January 30, 2020, the World Health Organization (WHO) declared the Covid-19 outbreak to be a global health emergency. 2021) (Bergman & Olsen).

This pandemic has caused many economic, educational, social, and environmental problems. Every day an increase of victims occurs, resulting in many workers losing their jobs. In addition, many workers are unemployed due to layoffs. This is because the losses incurred by the company as a result of the movement control order (MCO) occur. Public programs are also not allowed, such as wedding feasts, dining at restaurants, iftar, and performances. Daily activities are also affected and limited due to MCO. For example, celebrities are not allowed to film to reduce the Covid-19 case. Students are not allowed to learn face to face, but learning must be done virtually. However, many students experience stress because of using this method in learning (UNICEF, 2021).

The problem of this study focused on the impact of Covid-19 on mental health among university students. It is a new virus but has influenced and had a huge impact on the world economy and society. Moreover, the effects of this pandemic have caused problems, and disruptions to the global population's mental health also caused negative psychosocial impacts that can lead to psychological crises. According to the World Health Organization (WHO) 2021, "Mental health is a state of well-being in which an individual realizes his or her own abilities, can cope

with the normal stresses of life, can work productively, and is able to make a contribution to his or her community."

A learning environment is a place where people can study and teach. To ensure the efficacy and development of learning outcomes, one crucial aspect must be addressed. Intellectual activity, interaction, idea generation, friendship, collaboration, learning, personal growth, and student development can all benefit from a good learning environment. Various factors interact and influence pupils in a learning setting. In terms of achievement, satisfaction, comfort, health, and enjoyment, the study found a link between the learning environment and pupils (Higgins, et al., 2005; Che Ahmad, Osman, & Halim, 2010). Furthermore, the learning environment might have an impact on students' social connections and behaviour (Sanoff, 2000). As a result, an unpleasant learning environment is likely to cause problems and disruption in the mental health of some students. Therefore, this study aimed to determine the factors that effected mental health problems among university students at Universiti Malaysia Kelantan.

There were three objectives of this research:
1. To examine the relationship between gender toward mental health during Covid-19 in Universiti Malaysia Kelantan.
2. To identify the relationship between ethnicity toward mental health during Covid-19 in Universiti Malaysia Kelantan
3. To determine the relationship between socioeconomic status towards mental health during Covid-19 in Universiti Malaysia Kelantan

Significance of the Study

Researcher

This research sought to provide clearer information and address information's full existence to new researchers. This research also provided future studies with new resources, knowledge, and the latest information on the impact of a movement control order on mental health among students of the Faculty of Hospitality, Tourism, and Wellness at Universiti Malaysia Kelantan. Based on this study, we were all aware that the covid-19 pandemic in Malaysia has had a negative impact in various aspects, especially in the economic aspect. This pandemic affected Malaysia throughout the country in 2020. However, the most significant impact effected was mental health, especially among university students. This could help them investigate mental health percentage surveys more specifically, whether at Universiti Malaysia Kelantan or elsewhere.

Authorities

The next group of people who would be interested in the study is the authorities. This report's objective was to supply the relevant authorities with specific information regarding The Impact of the Movement Control Order on Mental Health Among Students Attending the Faculty of Hospitality, Tourism, and Wellness at Malaysian Universiti Kelantan. The findings of this study will provide the relevant authorities with information regarding the factors that can cause an impact of the Movement Control Order on the mental health of students studying in the Faculty of Hospitality, Tourism, and Wellness at Universiti Malaysia Kelantan. For instance, the government of Malaysia has recently started to focus more closely on the progression of the country's rate of mental illness over time; despite this, there has been significant progress, particularly regarding to the Covid-19 pandemic. This is an initiative that will make it easier to see the scope of the issue regarding mental health among university students. Campaigns, programmes, and other activities can help students become more self-aware and take the initiative to determine whether or not they require assistance or how they can improve their own mental health.

Consumers

The findings of this study are also significant for consumers. Owing to the fact that the user or community is an essential factor in determining the mental level of an individual's own health. A number of studies, including "The Impact of Movement Control Order on Mental Health Among Student University Populations" and others, have found that it demonstrates a high prevalence of positive mental health outcomes. Communities need to change their behaviour and the way they manage themselves in order to better cope with stress and the range of symptoms that accompany it, including changes in their routines. This study is also of great interest to the community as a means of assisting them in becoming more concerned about the situation and the surrounding community. The importance of this study lies in the fact that it provides information on the percentage of students in the faculty of hospitality, tourism, and wellness at Universiti Malaysia Kelantan. They are affected by movement control orders on their mental health.

LITERATURE REVIEW

Covid-19

Coronavirus disease is known as Covid-19. This disease is an infectious disease caused by the SARS-CoV-2 virus. Most people are infected with this virus without knowing it. This Covid-19 is dangerous. The Ministry of Health releases symptoms that patients will have respiratory illnesses, fever, coughs, and more. In conclusion, anyone can get this virus without knowing if they don't take precautionary measures. The riskiest are the older ones. For example, an elder who has chronic respiratory, chronic diabetes, cardiovascular disease, and more. The person can be seriously ill, and the worst consequence is, death.

Mental Health

According to the World Health Organization, "mental health is a condition of well-being in which an individual realises his or her abilities, can cope with the usual demands of life, can work productively, and can contribute to his or her community" (WHO). Stress can occur in any group, including the lives of students. Pre-Stress can happen to any group of people, including the lives of college and university students. It manifests itself in various ways, including family issues, campus life, financial difficulties, and peer pressure. This pressure can have a significant or minor impact on a student's stress level.

Research Hypothesis

The study's hypothesis is to determine whether there are any correlations or relationships between dependent variables and independent variables.

H1   There is a significant relationship between gender and mental health problems among students at Universiti Malaysia Kelantan.

H2   There is a significant relationship between ethnic and mental health problems among students at Universiti Malaysia Kelantan.

H3   There is a significant relationship between socioeconomic status and mental health problems among students at Universiti Malaysia Kelanta

Research Framework

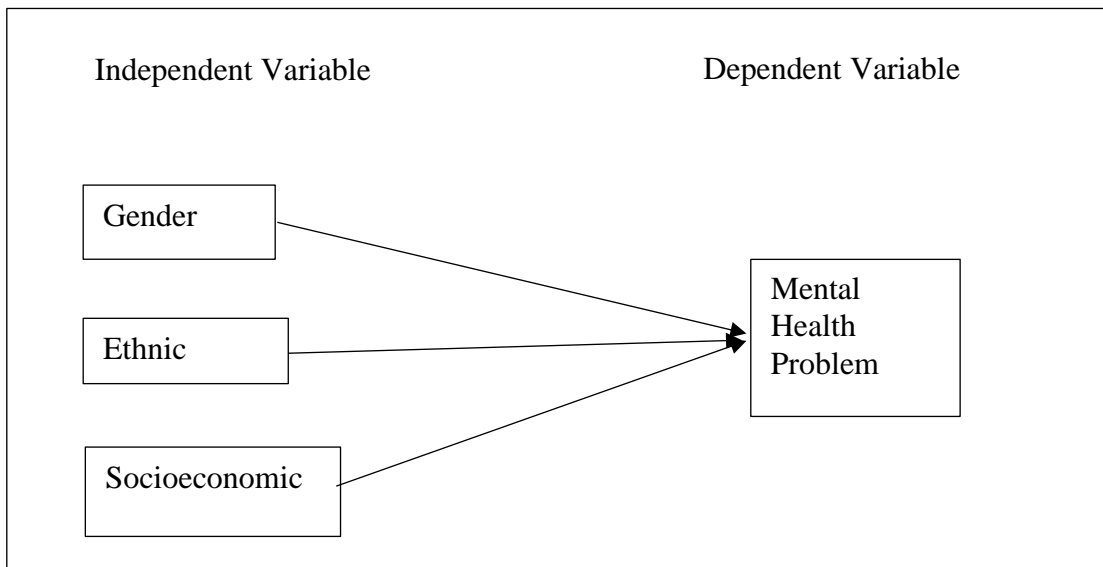
Figure 1 below shows the research framework of this research.


Figure 1: Research Framework

METHODOLGY

Research Design

In general, research design refers to a strategic framework that connects research themes to the research's implementation. The study design is a set of rules for configuring data collecting and analysis settings in a way that balances relevance to the investigation goal with the research's purpose (Durrheim, 2006).

There are two types of approaches which are quantitative and qualitative. The quantitative approach is a technique of collecting, analysing, interpreting, and writing the data that the researcher got for the study (Carrie, 2002). Using quantitative will aid the research in obtaining data by responding to relational questions of variables in the study. Meanwhile, the qualitative approach entails gathering and analysing narratives using other methods such as interviews or group focus. The qualitative approach is also used for research in-depth of understanding about human behaviour, experience, attitudes, and intentions (Shariques, 2019).

The main point of the study was to examine the impact of MCO on mental health among The Faculty of Hospitality, Tourism, And Wellness (FHPK) students at the Universiti Malaysia Kelantan (UMK). In this study, the researcher used a quantitative approach to collect data. A quantitative approach is a type of educational approach, in which the researcher can decide what to study, asking specific questions to the public about the study. A quantitative approach is used when one starts with a hypothesis and looks for confirmation or rejection of that hypothesis. Quantitative approaches tend to address study problems that require a description of tendencies or an explanation of the relationship between independent variables and dependent variables. The analysis obtained in this study provided information on mental health issues among students of Universiti Malaysia Kelantan in terms of gender, ethnicity, and socioeconomic status.

Data Collection

According to Shamoo & Resnik (2003), several analytical procedures provide data collection methods in research projects. This study made use of primary data. The main data was taken from the source from where the original statistics were received and is regarded as the best sort

of data in the research. Primary data is information obtained directly from the source by researchers through interviews, questionnaires, and experiments. Primary data is often acquired from the sources from which the original statistics were received, and it is regarded as the best sort of data in the study.

A questionnaire administered via Google Forms was utilized in this investigation. During Covid-19, questionnaires were used to collect information on the relationship between gender, ethnicity, socioeconomic position, and mental health among university students at Universiti Malaysia Kelantan. The questionnaire was supplied online and collected university students' mental health data. Surveys were conducted online as a result of the Covid-19 pandemic.

Sampling

The two categories of sampling strategies are probability and non-probability sampling procedures. This sampling technique ensures that every member of the examined population has an equal chance of being included in a randomly chosen sample. It is also known as random sampling. The five types of sampling include simple random sampling, stratified sampling, systematic sampling, cluster sampling, and multi-stage sampling. Non-probability sampling, on the other hand, places a greater emphasis on the researcher's capacity to select the sample on their own. It is not done in a haphazard way (Singh, 2018).

In this study, the researcher choose probability sampling, which was random sampling in this study because this method was easier to gather information and involved low cost for the researcher to collect data. The respondents of the questionnaire were the university students that suffered mental health disorders at Universiti Malaysia Kelantan. Several students were randomly selected to answer a questionnaire given by the researcher and data was collected based on their answers.

Sample size is a form of research used to determine the number of individuals, and it can be used to represent certain populations. The sample size can also refer to the number of respondents included in the study, then broken down by category based on gender, age and location. In statistical analysis, the sample size is very important to determine because when the sample size is small, then it does not produce the absolute reality of the population that needs to be studied. Otherwise, the sample size is large, so it takes a very long time to study (Kibuacha, 2021).

The sample size is a term used in market research to define the number group of subjects which are selected from the general population and are considered based on the population of a particular study. In this study, according to Krejcie and Morgan's table (1970), the sample size of our respondents, was 357, and they were selected for this research based on the 5382 university student populations at Universiti Malaysia Kelantan Kampus Kota. This population was divided into 2 categories which are FHPK with 3591 students and FKP with 1791 students. However, the researcher required a sample size for FHPK students only. (Figure 2.3)

Others	35	9.7
Material status		
Single	325	90.5
Married	28	7.8
Others	6	1.7

State			
Urban		160	44.6
Rural		198	55.2

Table 1 shows the total number of male respondents, which was 150 respondents, while the number of females was 209 respondents. Out of the 359 respondents, 41.8% of the total respondents are male and the remaining 58.2% are female respondents that were involved in the study. Regarding their age, the table shows that 18-20 years (33 respondents), 21-23 (274 respondents), 24-26 (25 respondents), and 27 and above (27 respondents) answered the questionnaire. It shows that the highest percentage of respondents were respondents at the age range of 21-23 (76.3%) and followed by 18-20 (9.2%), and 27 (7.5%), and the lowest percentage of respondents were 24-26 (7.0%). From the table, the religion of Muslims (304 respondents), Hindus (24 respondents), Buddhists (16 respondents) and others (15 respondents) answered the questionnaire. It shows that the highest percentage of respondents were Muslim (84.7%) and followed by Hindus at 6.7%, followed by Buddhists (4.5%), and the lowest percentage of respondents was "Others" (4.2%). As for race, it shows that Malays (274 respondents), Indians (29 respondents), Chinese (21 respondents) and others (35 respondents) answered the questionnaire. It indicates that the highest percentage of respondents was 76.3% which was from Malay, followed by others at 9.7%, followed by India at 8.1%, and the lowest percentage of respondents was from Chinese (5.8%). The table also shows the respondents' marital status. The total number of single respondents was 325 respondents while the number of married was 28 respondents. The number of respondents for the others was only 6 respondents. Out of 359 respondents, 90.5% of the total respondents were single, 7.8% were married, and the remaining 1.7% were other respondents that involved in the study. The last item in the questionnaire was about the respondent's hometown that 160 respondents were in the urban state, and 198 respondents were in rural areas. It shows that the highest number of respondents was the ones in rural (55.2%) and followed by Urban at 44.6%.

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this study.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Gender	Do you agree with the statement that female has more stress compared to male?	4.14	0.924
	Do you think that mental health can happen regardless of gender?	4.41	0.722
	Mental health also occurs when a person is unable to manage expenses well. Most female students prefer to spend their money compared to males.	4.02	0.957
	Do you think gender differences can cause mental problems?	3.63	1.094
	Do you think there are more mental health problems among males than females?	3.75	0.866

	Do you know that gender also plays a role in mental health?	3.92	0.896
Ethnicity	Do you feel that you have been threatened and treated unfairly because of your ethnicity?	3.25	1.412
	Do you feel that ethnic problems stemmed from your environment cause a person to be depressed?	3.69	1.056
	Do you think that differences between some social groups lead to ethnic discrimination?	3.94	0.911
	Do you feel that acts of physical assault and threats among ethnic groups can cause psychological problems or mental disorders?	4.14	0.830
	Do you feel that cultural and racial differences are the causes of ethnic problems that lead to stress problems among you?	3.78	0.968
	Do you think that differences in beliefs and religions lead to ethnic problems that lead to depression?	3.65	1.088
Socioeconomic	Are you sure the social-economic position can affect mental health during Covid-19 at Universiti Malaysia Kelantan?	4.11	0.866
	Do you think that enough money can reduce the problem of mental illness?	3.67	1.167
	Do you trust the people around you to be supportive in terms of emotional crises or problems?	3.86	0.949
	Do you agree that employment status like employed, self-employed, student, retired and more can be influenced by the socio-economic condition?	4.15	0.777
Mental health	Do you agree that educational level affect the socio-economic condition?	4.14	0.854
	Do you think that you have problems paying bills during the period of study?	3.95	1.035
	Do you have some acquaintances who can help you to overcome economic problems and crises?	3.75	1.035
	If you work, do you often feel overwhelmed while working?	3.63	1.022
	Do you often spend time working without focusing on your education?	3.36	1.143
	Do you often experience disturbances such as noise, odor pollution, cold and heat, and so on?	3.80	1.062

Table 2 shows the mean and deviation of the standard on independent variables of a personal nature. The highest average value was on the item "Do you think that mental health can happen regardless of gender", which was 4.41, where respondents agreed that gender could affect a person's mental health. The lowest mean value was regarding the item "Do you think gender differences can cause mental problems" of 3.63, where respondents slightly agreed that this mental health could be influenced due to gender specifics. The question "Do you feel that acts of physical assault and threats among ethnic groups can cause psychological problems or mental disorders" got the highest average value of 4.14, where respondents agreed that physical assault and threats among ethnic groups could cause psychological problems or mental disorders. The lowest average value was recorded on the question "Do you feel that you have been threatened and treated unfairly because of your ethnicity", with an average value of 3.25, where respondents somewhat disagreed that they felt had been threatened and treated unfairly because of their ethnicity. The highest average value was regarding the question "Do you agree that employment status like employed, self-employed, student, retired, and more can be influenced by the socioeconomic condition" which was 4.15, where the respondents agreed that could affect a person's socioeconomic situation whether they were capable or underprivileged. The lowest average value that recorded on the question "Do you think that enough money can reduce the problem of mental illness", with a mean value of 3.67, where respondents agreed that money could reduce the problem of mental illness. The highest average score question was "Do you often experience disturbances such as noise, odor pollution, cold and heat, and others" which was 3.80, where respondents agreed that they often experienced disturbances such as noise, odor pollution, cold and heat, and other disturbances. The lowest average value was recorded on the question "Do you often spend time working without focusing on your education", with a mean value of 3.36, where respondents agreed that they often spent time working without focusing on their education.

Result of Reliability Analysis

Table 3 below shows the result of reliability analysis.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Gender	6	0.751
Ethnicity	6	0.847
Socioeconomic	5	0.776
Mental Health among FHPK's Students	5	0.792

The Cronbach's Alpha result for the questionnaire were in the range of good (0.8) to acceptable (0.7) or good (0.8) to excellent (0.9). The result for gender indicated 0.751 value which was regarded as acceptable and good. The results of reliability statistics on ethnicity were 0.847 which yielded as excellent and good. The results of reliability statistics on socioeconomics were 0.776 which yielded as acceptable and good. The impact of MCO on mental health among FHPK's students in UMK to the point of causing mental health problems, had recorded that total of 0.792, which yielded as acceptable and good. Therefore, the data still can be considered for further analysis.

Result of Person Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

H	Relationship	p-Value	Result (Support/Not Supported)
H1	There is significant relationship between gender and mental health problem among student Universiti Malaysia Kelantan.	0.580	H1 is supported
H2	There is significant relationship between ethnic and mental health problem among student Universiti Malaysia Kelantan.	0.690	H2 is supported
H3	There is significant relationship between socioeconomic status and mental health problem among student Universiti Malaysia Kelantan.	0.653	H3 is supported

Table 4 shows the results of the correlation between the variables, DV which was mental health during MCO among FHPK's students (MH) and IV which were gender (GA), ethnicity (EC) and socioeconomic (SE). The Pearson correlation value for gender was 0.605. This suggests that the intensity of the relationship between mental health problems and gender was strongly positive. Ethnicity can cause mental health problems among students. The Pearson correlation value was 0.690, indicating that the intensity of the relationship between mental health problems and ethnicity was a strong positive correlation. The Pearson correlation value for socioeconomics was 0.653. This value indicates that the intensity of the relationship between mental health problems and socioeconomic problems was a strong positive correlation. Based on the result, all the hypothesis was supported and became a factor that led to the occurrence of mental health problems among FHPK's students at UMK during MCO.

DISCUSSION AND RECOMMENDATION

The reliability test was conducted among 357 respondents by using an online survey method. It has been tested with Cronbach's Alpha Coefficient range between 0.751 to 0.847, which indicated acceptable and good, where ethnicity reached the highest range value of 0.847, followed by socioeconomic, which was 0.776, and 0.751 for gender. All variables had reached a minimum internal consistency because of a range of values greater than 0.6.

In the Descriptive Analysis for the independent variables, the highest mean value among them was regarding socioeconomic status, which was recorded at 3.9877, followed by gender, which was 3.9777. The lowest mean value for independent variables was regarding ethnicity, which was 3.7416. Thus, the mean value for the dependent variable was 3.6983. In conclusion, the most influencing factor among the independent variables on mental health among FHPK students in Universiti Malaysia Kelantan was the socioeconomic status.

In this specific study, the researchers only focused on students of the Faculty of Hospitality, Tourism and Wellness (FHPK) at Universiti Malaysia Kelantan (UMK). At this point, it is possible to identify mental health issues that might be affecting students in the area. The study

is also a continuous investigation that may be conducted at the survey site, in various states, and in other scopes. This is since the study has a high probability of obtaining different results.

On the other hand, the availability of a sample with a larger size means it will be easier and more likely to get a response from the public. For this reason, future researchers will need to increase their sample size further improve the accuracy and reliability of the study. In conclusion, the researcher has a better chance of getting a high response rate if using the interview method. As a result, this strategy has the potential to reduce the amount of confusion and produce more accurate findings from the study.

CONCLUSION

In conclusion, this study was conducted to find out the influencing factors of mental health problems experienced by FHPK students at UMK when MCO occurred. Three independent variables were studied, which were gender, ethnicity, and social economy; that were selected to look at their relationship with the dependent variable, which was mental health problems among FHPK students. A total of 359 respondents aged 18 years and above were selected from FHPK students at UMK. Overall, based on Pearson correlation analysis, mental health problems have a value of *1, followed by gender, which was *0.605, ethnicity at *0.690, and socioeconomics at *0.653.

ABSTRACT

This study is about the factors of diabetes among senior citizens in Malaysia. Diabetes is a chronic disease whose effects can be seen over a long period of time, influenced by the way the body converts food into energy. Researchers found several factors that are often associated with diabetes, namely age, lifestyle, and heredity. This study was to identify the relationship between genetic factors that cause diabetes among senior citizens in Malaysia. Next, to investigate the relationship between lifestyle factors that caused diabetes among senior citizens in Malaysia and also examine the relationship between environmental factors that caused diabetes among senior citizens in Malaysia. This study was conducted using a quantitative approach to measure the genetics, lifestyle and environment that caused an increase in diabetes disease among senior citizens in Malaysia. A total of 400 respondents have participated in this study. Based on findings and implications, the most significant factor was genetic, which achieved the highest mean score of 50.3%, which was female.

Keyword: Diabetes, Genetic, Lifestyle, Environment, Senior Citizens in Malaysia

INTRODUCTION

Diabetes happens when the body is not able to take up sugar (glucose) into its cells and use it for energy. This results in a buildup of extra sugar in the bloodstream. Poorly controlled diabetes can lead to serious consequences, causing damage to a wide range of the body organs and tissues, including the heart, kidneys, eyes and nerves. Diabetes is a disease that is dangerous to everyone regardless of age. Therefore, the disease is also common in the elderly. This is because most senior citizens do not take care of their health, especially in terms of nutrition (Cleveland Clinic Medical Professional, 2021).

According to the enrollment data set, there are 1,614,363, who have been patients registered at the NDR, which is 99.3% of whom have type 2 diabetes. The average age of type 2 diabetes patients in the NDR is 63 years, and the average age at diagnosis for type 2 diabetes patients was 53 years. Most people with diabetes are women (57.1%) and Malay (59.2%). In 2019, there were 897,421 severely diabetic patients at the NDR (National Diabetes Registry Report, 2019).

The aim of this study was to identify factors of diabetes among senior citizens in Malaysia. There are three objectives in this research:
To identify the relationship between genetics as a factor that causes diabetes among senior citizens in Malaysia.
To investigate the relationship between lifestyles as a factor that causes diabetes among senior citizens in Malaysia.
To determine the relationship between the environment as a factor that causes diabetes among senior citizens in Malaysia.

Significance of Study

Every study conducted has a specific reason to be used as an authentic reference material. Thus, the motivation behind this review is directed to identify the elements that can cause diabetes among the elderly in Malaysia. Thus, this study could help the elderly to find out the cause of their diabetes. This is because, most likely diabetic factors such as unhealthy lifestyle factors can also be a factor in an individual suffering from other diseases. Adopting an unhealthy lifestyle can not only lead to diabetes, but it can also lead to an individual's potential to become obese. Therefore, this study is not only useful for diabetics, but it is also very useful as a reference for people with other diseases.

LITERATURE REVIEW

Genetic

Genetics is among the major factors in inheritance and variation in all living things, including humans and microorganisms. Chromosomes, which are made up of DNA and protein molecules called histones, store genetic information in living things. Therefore, genetics is a natural thing that cannot be changed by humans, even if it has a negative or positive impact on human life. Genetics-related matters that are often a major issue are the risk of hereditary diseases that exist as a result of genetic problems faced by parents that will be inherited by the unborn child. One of the hereditary diseases caused by genetic factors is diabetes or better known as diabetes mellitus. Suspected susceptibility genes may hold the key to the development of diabetes. One of the most common chronic disorders in children is type 1 diabetes mellitus (Radha et al., 2003).

Lifestyle

Lifestyle can be defined as the way of life of an individual or a group of people. People in different societies have different lifestyles. Most people in Malaysia, especially the elderly, are very fond of consuming foods that contain excess fat, whether saturated or unsaturated fat. In animal experiments, the use of saturated, monounsaturated and polyunsaturated fatty acids, with the exception of n-3 fatty acids, resulted in insulin resistance when a high-fat diet was taken (Steyn et al., 2004). This will negatively impact an individual suffering from diabetes, especially the elderly who are a group with great potential to suffer from it. Therefore, Type 2 diabetes is clearly associated with an inactive lifestyle and poor diet (Moore et al., 2011).

Environment

The environment is thought to be influenced by genetic factors in the development of diabetes mellitus (Adeghate et al., 2006). A bad environment will trigger various types of diseases like diabetes and will cause health problems. In the parthenogenesis of diabetes, environmental variables play a role. Contaminated water, soil, stress, retrovirus exposure, and immune cell destruction are all examples of environmental influences (Raman, 2016). Furthermore, air pollution has been linked to poor glucose metabolism, insulin resistance (IR), and type 2 diabetes mellitus in a recent investigation (Pearson et al., 2010); (Kramer et al., 2010).

Diabetes

The International Diabetes Federation recommends that the reasons for the development of diabetes are population maturity and unwanted lifestyle practices. Some of these unfortunate lifestyle practices include being completely inactive, smoking, drinking alcohol, and following an unwanted diet regimen.
After adjusting for common hazard factors, we found that independently consolidated lifestyle behaviors were associated with mortality and morbidity from diabetes, cardiovascular infection, and malignant growth (Cheng et al., 2012). In some cases, diabetic patients caused

by mutations in the genetic factor of hepatocyte nuclear factor 1 (HNF-1) have been described as sensitive to the hypoglycemic effects of sulfonylureas (Pearson et al., 2003). Insulin-subordinate (IDD) and non-insulin-subordinate diabetes (NIDD) are discrete issues

Research Hypothesis

In this study, the three-hypothesis tested were:

H1: There is a significant relationship between genetic factors that cause diabetes among the senior citizens in Malaysia

H2: There is a significant relationship between lifestyles factor that cause diabetes among the senior citizens in Malaysia

H3: There is a significant relationship between environmental factors that cause diabetes among the senior citizens in Malaysia

Research Framework

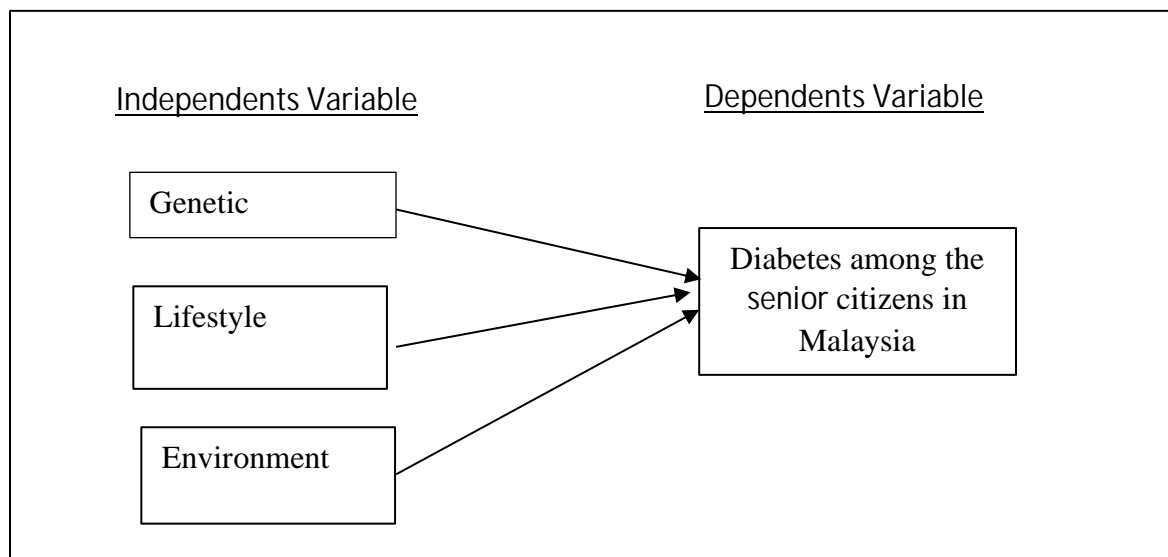
Figure 1 below shows the research framework used in this research.


Figure 1: Research Framework

METHODOLOGY

Research Design

This study used a quantitative method to gain data through the questionnaire in Google Forms. The questionnaire consisted of 4 parts of 20 items. Part A was about demographic respondents, and parts B, C and D were about independent variables and dependent variables. Questionnaires were used to obtain diabetic patients in Malaysia who were caused by genetic, lifestyle and environmental factors.

Data Collection

In this study, Google Forms was used for data collection that was created as a questionnaire to collect data. The questionnaire was distributed to 400 respondents in this study. Respondents were also selected randomly to answer the question factor of diabetes among senior citizens in Malaysia.

Sampling

The probability sampling technique was the sampling method that was used in this research. To represent the entire data set, a simple random sample was taken in a small random portion of the entire population, in which each member had an equal chance of being selected.

Data Analysis

This study usesd two data analysis, which were descriptive analysis and Pearson correlation analysis. The collected data were analyses by using Statistical Package for the Social Sciences (SPSS) to get the statistics on the relationship between independent variables and dependent variables.

FINDINGS

Results of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Respondents' Profile (n=400)

Characteristics	Frequency (N)	Percentage (%)
Gender		
Male	199	49.8
Female	201	50.3
Age		
18-27 years	42	10.5
28-37 years	39	9.8
38-47 years	104	26.0
Above 48 years	215	53.8
Status		
Married	240	60.0
Single	60	15.0
Divorced	100	25.0
Employment status		
Student	27	6.8
Self-employed	135	33.8
Employed	188	47.0
Unemployed	50	12.5

Table 1 depicts the profile of the respondents. Out of 400 respondents, the majority of the respondents were females, which accounted for 50.3% of the total sample. In terms of the respondents' age, 10.5% of them were 18 to 27 years old, 9.8% were 28 to 37 years old, 26.0% were 38 to 47 years old, and 53.8% were 48 and above. Meanwhile, in terms of status, most of the respondents were "Married" with 60%, followed by divorced with 25%, and single with 15.0%. As for the employment status, out of 27 respondents recorded, 6.8% of the respondents were students, 33.8% were self-employed, 47.9% were employed, and 12.5% of them were unemployed. The statistics nearly represent the actual demographic tabulation with regard to the factor of diabetes among senior citizens in Malaysia.

Results of Descriptive Analysis

Table 2 below shows the result of descriptive analysis of this research.

Table 2: Results of Descriptive Analysis

Variables	Item	Main Score	Standard Division
Genetic	Do you have a family history of diabetes?	1.36	0.481
	Through the consanguinity of whom that have diabetes?	2.63	1.404
	If your family has diabetes. What types of diabetes they have?	1.80	0.828
	Does your family that have other diseases as well which can cause diabetes?	1.36	0.481
	Is your family's overweight the cause of diabetes?		
Lifestyle	What kind of daily physical activity do you do every day?	2.16	0.71
	Do you check blood sugar levels with care and attention?	1.43	0.49
	Do the foods that you choose to eat make it easier to achieve optimal blood sugar levels?	1.51	0.50
	Do you do regular physical activity to achieve optimal blood sugar levels?	1.6	0.49
	Is your diabetes self-care being poor?	1.52	0.50
Environment	Is your environment prone to smoking activities?	1.28	1.45
	Does your environment exhibit a healthy influence on you such as the influence of healthy lifestyle practices?	1.51	1.5
	Is your environment prone to infection?	1.53	1.5
	Is your environment equipped with health infrastructure facilities such as hospitals or clinics?	1.15	1.35
	Is your environment equipped with facilities for obtaining information on diabetes control such as diabetes education programs?	1.48	1.5
Diabetes among Senior Citizens	How often do you worry about that your body looks different because have diabetes?	2.94	1.11
	How often do you worry about that you had to not go to work?	2.47	1.12
	How often do you worry about that you will not be allowed to take insurance?	2.31	1.23
	How often do you worry about getting complications as a result of your diabetes?	2.90	1.17
	Compared to other people your age, do you consider your health?	2.71	0.8

Results of Reliability Analysis

Table 3 shows the results of liability diabetes among senior citizens for the variables.

81

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha
Diabetes	5	0.864
Genetic	5	0.687
Lifestyle	5	0.414
Environment	5	0.125

.   Table 3 presents the Cronbach's Alpha values of the questionnaire, which were in the range of very good level (0.125) to excellent level (0.864). A total number of five independent variables were tested using Cronbach's Alpha. The dependent variables were diabetes which showed excellent levels and reliability in the strength of Correlation (5 items: a= 0.864). Then, the first independent variable was genetic, which shows the second excellent level, which is (5 items: a= 0.687). Besides, the second independent variable that was in a very good position was lifestyle, which was (5 items: a=0.414). The last one was the third independent variable which was the environmental factor, that was in a good position which was recorded (5 items: a= 0.125). Therefore, the data were considered suitable for further analysis.

Results of Pearson Correlation Analysis

Table 4 below shows the result of correlation analysis of this research.

Table 4: Pearson correlation analysis

Hypothesis	Place Value	Result (Supported/ Not Supported)
H1: There is a significant relationship between genetic factor that cause diabetes among the senior citizens in Malaysia	-0.317	Not Supported
H2: There is a significant relationship between lifestyles factor that cause diabetes among the senior citizens in Malaysia	0.405	Supported
H3: There is a significant relationship between environment factor that cause diabetes among the senior citizens in Malaysia	0.204	Supported

Table 4 shows that genetic factors that caused diabetes among the senior citizens in Malaysia had a significant correlation at r = -0.317, p < 0.01. This shows a negative relationship between genetic factors that caused diabetes among the senior citizens in Malaysia. There   was a statistically significant correlation between lifestyle factors that caused diabetes among senior citizens in Malaysia, with r = 0.405, p < 0.01. This shows a positive relationship between lifestyle factors that caused diabetes among senior citizens in Malaysia. There was a statistically significant correlation between environmental factors that caused diabetes among the senior citizens in Malaysia, with r = 0.204, p < 0.01. This shows a positive relationship between environmental factors that caused diabetes among senior citizens in Malaysia. The result for hypothesis 1 (H1) were accepted at a 0.01 significance level. Next, the results for hypothesis 2

(H2) and hypothesis 3 (H3) were accepted at a 0.01 significance level, according to the results.

DISCUSSION & RECOMMENDATIONS

In this study, there were several recommendations. This study only focused on the factor of diabetes among senior citizens in Malaysia. In addition, for further proposals to prevent diabetes in children in one state can also be made for future studies. In addition, conducting diabetes prevention programs among the elderly and also all people with type 2 diabetes can help them to maintain better health. This is because the Diabetes Prevention Program (DPP) suggests that both medications and lifestyle interventions can slow or prevent the progression from impaired glucose tolerance (IGT) to type 2 (1) diabetes. DPP showed that compared to placebo intervention, intensive lifestyle intervention reduced the incidence of type 2 diabetes by 58% and metformin intervention reduced the incidence of type 2 diabetes by 31% over a period of 2.8 years (William et al., 2003). The next recommendation is regarding the senior citizens, or everyone with type 1 diabetes can also prevent it. Prevention of type 1 diabetes mellitus (T1DM), based on the prevention of islet β cell destruction, can be considered at different stages of the disease, from the stage before or after the onset of hyperglycemia. Antigen-specific therapy, the most widely studied antigens used in tests for the prevention of immunological β-cell destruction were insulin and GAD (Li Zhang et al., 2011). Based on the findings, it was found that these three factors had caused diabetes among senior citizens in Malaysia. The suggestion for future researchers was about studying the diabetes prevention in children and focus on one state. Researchers also recommended that the elderly should always practice a healthy lifestyle and make prevention and early treatment if they experience symptoms of diabetes.

CONCLUSION

In conclusion, this study has been accomplished to discover factors of diabetes among senior citizens in Malaysia. Three independent variables, namely genetic, lifestyle, and environmental, have been chosen to examine their relationships with the dependent variables, which were the diabetes factors among senior citizens in Malaysia.

ABSTRACT

The study is about the factors that affect dietary habits among UMK City Campus Students. Dietary habits are the habitual decisions of individuals or groups of people regarding what foods to eat. However, proper dietary choices require the consumption of vitamins, minerals, carbohydrates, proteins, and fats. Dietary habits and choices play a significant role in human health. Therefore, the research seeks to identify the relationship between physical activity, social influences, environments and dietary habits among Universiti Malaysia Kelantan students. About 364 students from the UMK City Campus were polled. In conclusion, one of the most common health problems in an individual, particularly among students, is poor dietary habits. The study will provide a better understanding and knowledge of the dietary habit factors among UMK City Campus students.

Keywords: Dietary Habits, Overweight, Healthy Lifestyle, Universiti Malaysia Kelantan.

INTRODUCTION

Malaysians' lifestyles are rapidly changing in line with their country's advance and progressive growth. Financial, physical, and cultural factors, such as families eating out, skipping meals, and eating too much fast food, all influence dietary patterns (Sidiq & Rampal, 2009). The ability of people to maintain healthy eating behaviours deteriorates over time. This is evident in Malaysia, where 64% of men and 65% of women are overweight or obese, making the country the Asian country with the highest obesity and overweight rates (World Health Organization, 2019). According to the Malaysian Ministry of Health, being underweight is cause for concern because it can lead to anaemia, a decrease BMI, and a distorted view of one's own body, which can lead to anorexia and bulimia (Nor Hazwani et al, 2012).

University students have been shown to have unhealthy eating habits. Scholars have extensively researched their poor eating habits, so this is unsurprising. Huda and Ahmad (2010) found that 27% of 624 University Sains Malaysia students were underweight, while 12% were overweight or obese. Besides that, according to a study by Moy et al, (2009), 35.3 % of 2665 students at a public college in Kuala Lumpur ate fast food at least once a week. According to Gan et al, (2011), more than half of college students do not consume the recommended amounts of calories, Vitamin C, and minerals based on the Malaysian Recommended Nutrient Intake (RNI).

A 2005 report on the global obesity burden estimated that 33.0% of adults (1.3 billion people) are overweight or obese. This figure is expected to rise to 57.8 percent (3.3 billion people) by 2030 if the current trends continue (Kelly et al, 2008). Obesity prevalence in Brunei Darussalam has risen from 12% in 1996 to 27.2 % in 2011. Obesity is known to be a risk factor for a variety of noncommunicable diseases (NCDs), including diabetes, hypertension, cardiovascular disease, and stroke, so this concerning trend has piqued the public's interest (Zakaria et al,

2014). As an outcome, the goal of this research is to find out what factors influence university students' dietary habits. There are three objectives of this research:

1. To identify the relationship between physical activity and dietary habits among Universiti Malaysia Kelantan students.
2. To determine the relationship between social influences and dietary habits among Universiti Malaysia Kelantan students.
3. To examine the relationship between environments and dietary habits among Universiti Malaysia Kelantan students.

Significance of the Study

The significance of the study lies in the possibility that the findings will improve students' health and remain active. Next, the management of the Universiti of Malaysia Kelantan can then use the information to develop a programme that instils healthy eating habits among students. The results can also help students' families with good dietary habits. Additionally, the findings can benefit KKM and KPT's eating habits by at least 50%.

In order to be healthy, students must first plan and adhere to a strict diet. Such a diet needs to include all the minerals and vitamins required by the body. Moreover, consume only healthy foods and avoid the junk, high-carbohydrate, and fatty foods. Correspondingly, getting up early in the morning for a variety of reasons, the most important of which is that it is a healthy habit. Second, getting up early allows students to spend quality time with their families while also preparing for class. Furthermore, this determines when students should sleep and the significance of sleeping early because its de-stresses the body.

Exercise on a regular basis keeps the student body active and relieves muscle tension. Being healthy does not rely solely on physical fitness. Being mentally and emotionally fit is what it means to be healthy. Being healthy should be part of every student's daily routine. Chronic diseases and long-term illnesses can be avoided with a healthy lifestyle. Feeling good about yourself and looking after your health are important for your self-esteem and self-image.

LITERATURE REVIEW

Dietary Habits Among University Malaysia Kelantan Students

University students have been shown to have unhealthy eating habits. Scholars have extensively researched their poor eating habits, so this is unsurprising. According to Huda and Ahmad (2010), it was discovered that 27% of 624 students at Universiti Sains Malaysia were underweight, while about 12% were overweight or obese. Furthermore, according to a study conducted by Universiti of Malaya, 35.3 percent of 2665 students at a public university in Kuala Lumpur ate fast food at least once a week (Moy et al., 2009). Gan et al., (2011) more than half of the university students did not consume the recommended number of calories, vitamin C, and minerals, as recommended by the Malaysian, Recommended Nutrient Intake (RNI).

In comparison to children and adults, university students are frequently overlooked in studies of eating behaviour. Instead, students are frequently overlooked as potential targets for promoting a healthy lifestyle. As students progress through college, their responsibilities increase. According to Khor et al, (2002), when university students are stressed due to academic challenges, their eating habits and health may be influenced. Furthermore, Nelson et al., (2008) stated that because of the numerous negative effects of negative eating behaviour on these

young people's health, promoting health and preventing diseases have been identified as critical during the transition phase of young people from adolescence to adulthood. University students must eat a well-balanced diet because well-nourished people learn better. Eating well can also help them be more alert in class and remember things better, which can help them improve their grades. Students can also avoid developing chronic illnesses later in life.

Physical Activities

Exercise can help students keep track of how much students eat (Martins et al, 2008). Donelly et al, (2013) in both men and women, guided physical exercise was found more effective than calorie reduction in causing clinically relevant fat loss and fat-free mass preservation. According to Feuerbach et al, (2015) because of an acute bout of exercise that reduced brain responses to 12 food cues, overweight teenagers ate fewer calories. Additionally, McNeil et al, (2015) acute exercise reduced hedonic liking for high-fat diets in general and strengthening exercises in particular reduced hedonic liking for high-fat foods. More research is needed to fully comprehend the long-term effects on food consumption and dietary preferences.

Food intake and physical activity are two of the most important components of weight management, as previously stated; thus, the appetite regulation's role in eating behaviour and the changes that may occur with exercise is critical. The desire to eat is referred to as appetite, which is a psychological construct. It controls energy intake in order to meet physiological demands. Physical activity levels were observed to influence dietary intake. Students who engaged in regular physical activity seemed to prefer a higher food intake than students who did not engage in any physical activity at all. Outdoor sports, bodybuilding, and regular walking all had an impact on dietary choices, with the majority of them involving more carbohydrate and protein consumption (Austin & Marks, 2009).

Social Influence

Dietary habits are influenced by the social environment. When a person eats with others, a person eats differently than when a person eats alone. A person's eating habits tend to mirror those of their closest friends. One reason for this is that we find conforming to other people's behaviour to be adaptive and rewarding. Eating habits are influenced by the actions of others, and also shared cultural perceptions and environmental cues. If a person's eating norm is perceived to be significantly created on social comparison, it is more likely that we will follow (Higgs, 2016).

A common activity is a dinner with friends, family, or co-workers (Oh et al, 2014). Given the importance of social eating, it's critical to comprehend how and why we dine with others has an impact on our food choices. Other people have a variety of effects on our food intake and decisions, according to decades of research (Herman et al, 2003). We are more likely to consume a considerable amount of food when we dine in a group rather than alone. Observational and experimental studies, as well as food diaries by Herman (2015), have all demonstrated the existence of such 'social facilitation' of eating. We may eat less than usual because we believe that eating a single amount will impress others (Vartanian, 2015). Other people influence our eating patterns because they serve as a model or norm for proper behaviour (Higgs, 2015). Several recent researches have added to our knowledge of the ways in which social norms influence consumption and the methods that support it.

Environment Condition

Environmental factors, as well as potential action and policy strategies to promote healthy eating, influence food choices. Residences, childcare, schools, after-school programmes,

workplaces, retail food stores (supermarkets and small grocery stores) and eating out at restaurants and fast-food outlets have all been studied. Uncontrollable indirect variables can influence food preferences (Story, 2008).

In short, culture is the way a group of people lives their lives. It is the accumulation of "ethnic, religious, or social values, beliefs, attitudes, and behaviours held by members of a particular community" (PG, 2011). Culture has a strong influence on a person's or a group's eating habits, which is not amazing given that different cultures have different meals and cuisine (EC, 2011). Culture can have an impact on people's eating habits and dietary beliefs (Kuhnlein VH, 2013). Eating is typically done with others at communal festivals, which fosters acceptance.

Research Hypothesis

The literature review revealed the independent variables for factors that affect dietary habits among Universiti Malaysia Kelantan City Campus students. Therefore, the study team intends to look into the relationship between these characteristics. Based on the literature evaluation and the research topic that has been discussed, the study hypotheses are as follows:

H1   There is a significant association between physical activity and dietary habits among Universiti Malaysia Kelantan City Campus students.

H2   There is a significant association between social influences and dietary habits among Universiti Malaysia Kelantan City Campus students.

H3   There is a significant association between environmental conditions and dietary habits among Universiti Malaysia Kelantan City Campus students.

Research Framework

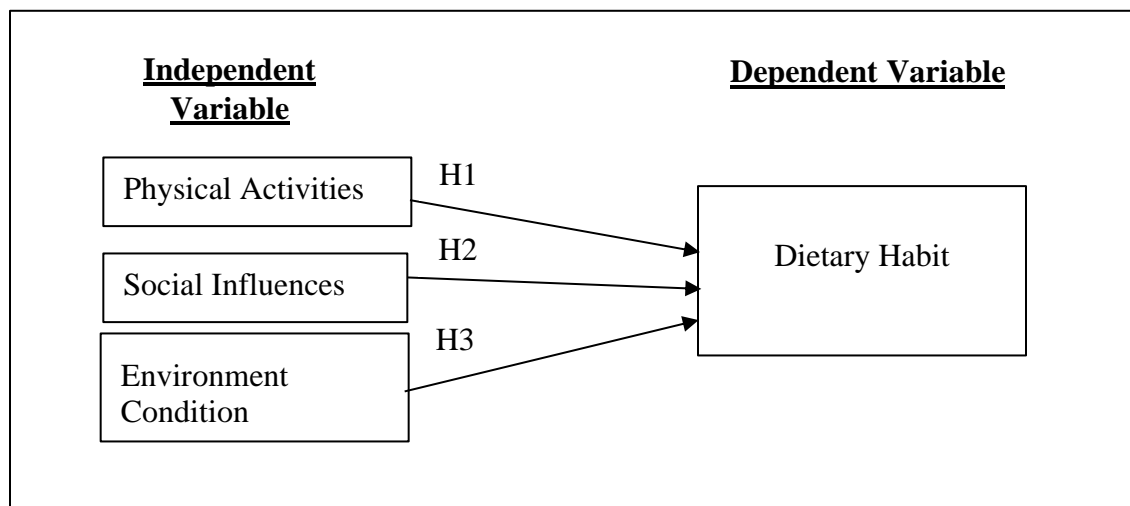
Figure 1 below shows the research framework used for this study.


Figure 1: Research Framework

METHODOLOGY

The study used a quantitative research design to study the knowledge and perception of factors that affect dietary habits among Universiti Malaysia Kelantan students. The quantitative research approach using a cross-sectional study design was used to measure the public knowledge and perception of the effect on dietary habits and independent variables.

Data Collection

A set of questionnaires was used for data collection. A questionnaire is a type of research instrument that consists of a list of questions that are used to collect data from respondents. Respondents were sent a series of links to questions via WhatsApp and the Telegram group. The question was to be filled out using Google Forms by the respondents.

Sampling

The sampling method used in this study was non-probability sampling which is convenience sampling. The study used this method because the questionnaires were prepared and distributed online or posted to social media pages to gather information from the respondents. The questionnaire was distributed to the respondents who were among the Universiti Malaysia Kelantan City Campus students through WhatsApp and Telegram groups.

The sample for this study was the category of students studying at the UMK City Campus. The sample size was determined by using the Table of Krejcie & Morgan (1970). In this study, our population was 6365 students. Based on Krejcie & Morgan's table, there was no specific 6365 population so the researcher chose the population that was the nearest to 6365, which was a 7000 population. Thus, our sampling size was 364 respondents from Universiti Malaysia Kelantan Campus City students that were selected to answer the questionnaires.

Data Analysis

There are four types of data analysis used in the study, namely frequency analysis, descriptive analysis, reliability test and Pearson correlation analysis. The data obtained was analysed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Frequency Analysis

Characteristic	Frequency	Percentage (%)
Gender		
Male	158	43.3
Female	206	56.7
Age		
18-20 years	36	9.9
21-23 years	246	67.6
24-26 years	67	18.4
27 years old and above	14	3.8
Race		
Malay	195	53.6
Indian	90	24.7
Chinese	59	16.2
Others	20	5.5
Year of Studying		
Year 1	65	17.9
Year 2	69	19.0
Year 3	168	46.3

Year 4	61	16.8
Faculty		
FHPK	197	54.1
FKP	167	45.9
Course		
SAW/SAS	93	25.6
SAH	62	17.1
SAP	46	12.7
SAK	22	6.1
SAE	30	8.3
SAL	26	7.2
SAB	29	8.0
SAR	24	6.6
SAA	22	6.1
JSD	9	2.5
Accommodation Status		
On-campus	129	35.5
Off-campus	235	64.5
State		
Perlis	27	7.4
Perak	30	8.3
Kelantan	46	12.7
Pahang	33	9.1
Terengganu	33	9.1
Melaka	19	5.2
Negeri Sembilan	27	7.4
Kedah	25	6.9
Johor	29	8.0
Selangor	21	5.8
Kuala Lumpur	18	5.0
Sabah	14	3.9
Sarawak	16	4.4
Pulau Pinang	25	6.9
Residence		
City	216	59.3
Rural	98	26.9

The respondents' profile is summarized in Table 1. The total number of male respondents was 158, while the number of female respondents was 206. The highest percentage of respondents are those within the age range of 21-30 years old with 67.6%, followed by 24-26 years old with 18.4%, 18-20 years old with 9.9%, and lastly 27 years and above with 3.8%. Based on the responses, the overall 364 respondents are Malay (195 respondents), Indian (90 respondents), Chinese (59 respondents), and others (20 respondents). Therefore, the highest percentage of respondents in terms of the race is Malay with 53.6%, followed by India with 24.7%, Chinese with 16.2%, and "Others" with 5.5%.Subsequently, in terms of year of study, the overall 364 respondents involved are Year 1(65 respondents), Year 2 (69 respondents), Year 3 (168 respondents), and Year 4 (61 respondents). Based on the table, the highest percentage of the respondents in terms of year of studying is Year 3 with 46.3%, followed by Year 2 with 19.0%, Year 1 with 17.9%, and Year 4 with 16.8%. Based on the table, in terms of faculty, most of the respondents are from FHPK (54.3%, n=197) and followed by FKP (45.7%, n=166).Next, the number of respondents by course consist of SAW/SAS (93 respondents), SAH (62 respondents), SAP (46 respondents), SAK (22 respondents), SAE (30 respondents), SAL (26

respondents), SAB (29 respondent), SAR (24 respondent), SAA (22 respondent) and JSD (9 respondent). Subsequently, it shows the percentage of the respondents by course which were SAW/SAS (25.6%), SAH (17.1%), SAP (12.7%), SAK (6.1%), SAE (8.3%), SAL (7.2%), SAB (8.0%), SAR (6.6%), SAA (6.1%) and JSD (2.5%).In terms of the total frequencies based on states, Perlis recorded 27 respondents, followed by Perak with 30 respondents, then Kelantan with 46 respondents, Pahang and Terengganu with 33 respondents, Melaka with 19 respondents, followed by Negeri Sembilan with 27 respondents, Kedah with 25 respondents, Johor with 29 respondents, Selangor with 21 respondents, followed by Kuala Lumpur with 18 respondents, Sabah with 14 respondents, Sarawak with 16 respondents, and lastly followed by Pulau Pinang with 25 respondents.Lastly, residence categories are city and rural areas. The total number of respondents are 364 respondents. The frequency in terms of residence is the city with 216 respondents followed by rural area with 98 respondents. Meanwhile, for the percentage of respondents by residence, the percentage for the city is 59.3% and for rural areas is 26.9%.

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research.

Table 2: Descriptive Analysis

Variables	Statement	Mean	Standard Deviation
Physical Activities Factors	Do you do exercise?	4.16	0.895
	Do you usually practice physical activity?	3.39	1.083
		3.84	1.067
	How frequently do you exercise in a week?	3.57	1.363
		3.81	1.057
	Do you like to spend your time exercising?	3.51	1.345
	I always do the regular physical activities in a week?		
	I always exercise in the area close to where I live.		
Social Influences Factors	Do you prepare/cook meals together with your friends?	3.80	1.082
	Do you usually eat meals such as rice, meals, vegetables and fruits?	3.58	1.116
	Do you often eat out in restaurants with friends?	3.74	1.040
		3.43	1.091
	Do you often order food takeaways/deliveries when I am with my friend?	4.00	1.026
		3.32	1.230
	In my family, a large portion of food is served.		
	My family members suggest eating when I seem stressed out or upset.	3.83	1.062
		3.66	1.243
	How often do you eat with your family at home?		
	How often does your family eat in restaurants or use ready-made fast food?		

		Mean	SD
Environment Condition Factors	Are you attracted to foods that are often viral?	4.05	1.056
	I know about viral foods from social media such as Tik Tok, Facebook, Youtube, Instagram and WhatsApp.	3.77	1.189
	The food ads displayed on social media made me interested in eating.	3.95	1.136
	There are many eateries around the university/home.	3.47	1.080
	There are many eateries around the university/home I always go to.	3.64	1.079
	Food promotions held around the university/home attracted my attention to buy.	3.73	1.038
Dietary Habits Among Students	I often take heavy meals every day?	4.15	1.015
	I often eat 3 times a day?	3.52	1.130
	Do you eat breakfast every day?	3.52	1.371
	Do you eat snacks between regular meals?	3.60	1.094
	How often do you eat fruit?	3.60	1.345
	How often do you eat vegetables?	3.58	1.133
	How much is your daily water intake?	3.76	1.124

Table 2 represents the mean and standard deviation analysis for an independent variable which is "Physical Activities Factors". The highest mean value is item 1 which was 4.16 whereby most respondents answered almost frequently for "Do you do exercise?" question followed by the question of "How frequently do you exercise in a week?" which is item 3 with the mean value of 3.84. Next, the question is item 5 which is "I always do the regular physical activities in a week?" statement with the mean value of 3.81. Furthermore, the mean value was 3.57 for "Do you like to spend your time exercising?" is item 4 in our research. Then, for item 6 the mean value was 3.51 which was "I always do exercise in the area close to where I live." statement. Lastly, the lowest mean value was 3.39 which is "Do you usually practice a physical activity?" question in item 2 in our result.

Next, the mean and standard deviation analysis for the independent variable of "Social Influences Factors", item 5 scored the highest mean value which was 4.00, where most respondents responded frequently for "In my family, large portions of food are served." statement. After that, item 7 which is "How often do you eat with your family at home?" statement with a mean value of 3.83 followed by the question of "Do you prepare/cook meal together with your friends?'' which is item 1 with the mean value of 3.80. Next, the mean value was 3.74 for item 3 which is "Do you often eat out in restaurants with friends." statement. Furthermore, the mean value was 3.66 for "How often does your family eat in a restaurant or use ready-made fast food." is item 8 in our research. Then, for item 2 the mean value was 3.58 which is "Do you usually eat meals such as rice, meat, vegetables and fruits." question. Followed by the question of "Do you often order food takeaways/deliveries when I am with my friend?" which is item 4 with the mean value of 3.43. Lastly, the lowest mean value was 3.32 which is "My family members suggest eating when I seem stressed out or upset." for item 6.

Next is the mean and standard deviation analysis of respondents on the independent variable which is Environment Condition Factors. Based on the table, the highest mean value is item 1 which was 4.05 with the respondent answered almost frequently for the "Are you attracted to

foods that are often viral?" question. The second mean value was 3.95 in item 3 which is "The food ads displayed on social media made me interested in eating.". Furthermore, item 2 with a mean value of 3.77 which is "I know the viral foods from social media such Tik Tok, Facebook, Youtube Instagram and WhatsApp.". Next, the mean value was 3.73 which is item 6 with the respondent frequently saying that "Food promotions held around the university/home attracted my attention to buy.". Then, for item 5 the mean value was 3.64 for the "There are many eateries around the university/home I always go to." statement. Lastly, the lowest mean value was 3.47 for item 4 which means that "There are many eateries around the university/home.".

Table 2 represents the mean and standard deviation analysis for dependent variable which is "Dietary Habits Among Students". Item 1 scored the highest mean value which was 4.15, where most respondents stated almost frequently for "I often take heavy meals every day" statement. After that, item 7 which is "How much is your daily water intake?" scored a mean value of 3.76. Next, items 4 and 5 their mean value was 3.60 which was "Do you eat snacks between regular meals?" and "How often do you eat fruit?" respectively. Furthermore, the mean value of 3.58 for the "How often do you eat vegetables?" statement for item 6. Lastly, the lowest mean value was 3.52 for item 2 and 3 which are "I often eat 3 times in a day?" and "Do you eat breakfast every day?" respectively.

Result of Reliability Analysis
Table 3 below shows the result of reliability analysis of this research.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Physical Activity	6	0.481
Social Influences	8	0.730
Environment Condition	6	0.779
Dietary Habits	7	0.280

Table 3 shows the results of the reliability test for all variables. The reliability test for physical activities, Cronbach's Alpha, showed a value of 0.481. In the reliability test for social influences, Cronbach's Alpha obtained a value of 0.730. The reliability test for Cronbach's Alpha environment condition showed a value of 0.779. While for the dietary habits' reliability test, Cronbach's Alpha obtained a value of 0.280. The value of Cronbach's Alpha should be acknowledged by HR-Guide, LLC (2018). If the alpha value is below 0.50 it cannot be accepted but if the value is 0.60 and above, it is considered the normal value. Meanwhile, if the value of alpha is 0.70, it is considered more than normal, 0.80 is a good value and 0.90 is better.

Result of Pearson Correlation Analysis
Table 4 below shows the results of correlation analysis.

Table 4: Pearson Correlation Analysis

Variable		Dietary Habits
Physical Activities	Pearson correlation	.224**
	Sig. (2-tailed)	.000
	N	364

Social Influences	Pearson correlation	.318**
	Sig. (2-tailed)	.000
	N	364
Environment condition	Pearson correlation	.242**
	Sig. (2-tailed)	.000
	N	364

Table 4 indicates the relationship between physical activities, social influences, environmental conditions and dietary habits. Based on the result, the significant value for physical activities was below 0.05, and when the P-Value was less than 0.05 it means the study rejects the null hypothesis. For H1, the Pearson Correlation was 0.224, showing that there is a significant relationship between physical activities and dietary habits among Universiti Malaysia Kelantan City Campus students. For H2, the Pearson Correlation was 0.318 showing a relationship between social influences and dietary habits. For H3, the Pearson Correlation was 0.242 indicating the low related relationship between environmental conditions and dietary habits.

DISCUSSION AND RECOMMENDATION

The researchers recommend several suggestions to improve the results of the study. The first recommendation in this study is for the university works with food service companies to offer a wider variety of foods and more dietary options for students. Instead of distributing the online survey, which is Google Form, it may be necessary for the responses on feedback on dietary habits among students. As for the second recommendation, the researcher also suggests for the university to educate students on dietary guidelines. Dietary guidelines are defined as a set of guidelines or qualitative statements that help a person or population make food choices that will help them live a healthy life, maintain an optimal weight, and reduce the risk of chronic diseases. This is due to a study that found increased knowledge of dietary guidelines to be positively related to healthy eating habits (Kolodinsky et al, 2007). These dietary guidelines would help students remember when they could obtain healthy food, and it would also encourage the merchants to devote one day per week to the success of this endeavour. It is important that UMK City Campus students are educated and knowledgeable in healthy eating behaviours and be able to choose healthy food choices in the future. This method is more subjective as it requires the researcher to observe and add the answers to the data. Lastly, the suitable recommendation is that students should change their lifestyle toward a healthier one. It is because adopting a healthy lifestyle and eating healthy foods can help to maintain health. The development of healthy lifestyle behaviours can have a long-term impact on their health and the health of future generations (Moy FM et al, 2009).

CONCLUSION

The purpose of the study is to identify the factors that affect dietary habits among Universiti Malaysia Kelantan City Campus students. In the study, the dietary habits of city campus students were affected by their lifestyles. As a result, students' lifestyles were represented by city campus students at the Universiti Malaysia Kelantan, which served as the independent variable. Furthermore, there were three independent variables: physical activity, social influences, and environmental conditions. Pearson Correlation Coefficient was used to analyse the relationships between independent and dependent variables. The result shows that the correlation between physical activity, social influences, and environmental conditions is highly significant. In conclusion, the findings of the study show that there is a link between dietary habits, physical activity, social influences, environmental conditions, and the lifestyle of city campus students at the Universiti Malaysia Kelantan.

ABSTRACT

Obesity has become a common problem worldwide which affects both developing and developed countries. Malaysia has the highest rate of adult obesity in Southeast Asia. Obesity has become a long-term medical problem with serious consequences for human health. This study aims to investigate eating habits, physical inactivity, and stress as significant factors causing obesity among adults in Malaysia. This study employs a quantitative method by distributing the questionnaire to 384 adults in Malaysia. This study evaluates the primary data through the SPSS version 26.0. The finding indicates that there is a positive relationship between eating habits, physical inactivity, and stress, and factors that cause obesity among adults in Malaysia. The Pearson Correlation shows eating habits have the highest connection compared to other factors. The relationship established in this study provides a better understanding of the causative factors for obesity among adults in Malaysia and future research may focus on children in different states.

Keywords: obesity, eating habits, physical inactivity, stress, adults.

INTRODUCTION

In this modern era, obesity has become a common problem worldwide. No country is free from obesity issues. Obesity is the leading health problem of Non-Communicable Diseases (NCDs). Obesity is a complicated disease with several causes. Since 1980, the rate of obesity has doubled and over a third of people are declared obese in the world (Chooi et al., 2019).

Besides that, obesity has become a major, long-term medical problem with serious consequences for human health. It will impact people in both physical and physiological health. In the United States, up to a two-thirds population of the obese are adults. Obesity affects approximately 315 million people globally (James, 2004). Throughout the last 30 years, the rates of obesity have increased massively globally, with adult and childhood obesity rates doubling (6–11 years) and adolescent obesity rates tripling (12–19 years) (Upadhyay et al., 2018). Malaysia is Asia's most obese country. Malaysia has the greatest adult prevalence of obesity in Southeast Asia at 15.6 percent in 2019. Followed by Brunei (14.1%), Thailand (10.0%), and Indonesia (6.9%) (Siong & John, 2021). Obesity affects 45 percent of Malaysians, which means that nearly one in every two Malaysians is fat.

This study aims to investigate the significant factors that cause obesity among adults in Malaysia. The factors are eating habits, physical inactivity, and stress. This study consists of three objectives:

1   To investigate eating habits as a significant factor to cause obesity among adults in Malaysia.
2   To examine physical inactivity as a significant factor to cause obesity among adults in Malaysia.

3   To determine stress as a significant factor to cause obesity among adults in Malaysia.

Significance of the Study

Malaysian Adults

The findings of this study will help Malaysian adults maintain a healthy body. As a result of this study, adults will learn about the effects and factors that contribute to obesity. Furthermore, they will be able to avoid some unhealthy behaviours, which will help them avoid obesity. This study may encourage young adults to be health-conscious, allowing us to prevent obesity among young adult .

Obese People

Obese people frequently have low self-esteem which leads to feeling insecure. Obese people may face body shaming from society as well. This research will help them educate people about the factors that contribute to obesity. Through this study, they may gain a better understanding of the importance of healthy eating, physical activity, and stress management. Additionally, this research will assist obese people in learning how to eat healthily, engage in physical activities, and manage their stress.

Parents

This study will motivate parents to spend more time with their children. This study could help parents understand how to prevent childhood obesity. So that they can provide the healthiest lifestyle for their children. They will thus be able to prevent their children from becoming obese. This could help their children live a healthier lifestyle and lower the risk of being obese

The Government

This study will help the government be more concerned about obese people, particularly adults. This is because many obese people struggle with their weight, and the government may help motivate them to lose weight. As a result, the government must address the problem of adult obesity and identify the factors that contribute to obesity to take steps towards a healthier weight with motivation on how to lose weight and keep it off.

LITERATURE REVIEW

Eating Habits

Individuals' eating habits and dietary habits are about the food choices and observances they make in their lifestyles. Age, sex, diet, physical activity, lifestyle, disease, culture, social, economic, religious, environmental, and food information private all possible causes. Adults have maintained these habits for so long that most individuals are unaware of them. Food consumption habits are linked to an individual's health state. Good eating habits are the core to good nutritional status, while bad eating habits contribute to poor health and diseases (Henry-Unaeze & Ngwu, 2020).

Obesity is caused by unhealthy eating habits (Chan et al., 2017). Mostly, people prefer fast foods and sugary foods. In other words, eating habits is related to when and how people consume food , the types of food they consume and with whom do they consume, as well as how they get, acquire, utilize, and discard the food, are all factors to consider. Sometimes, family eating or eating habits in family structure with the lifestyle habits can affect weight and health which could lead to obesity. Some families may eat high-fat, salt, and added sugar food and beverages or consume large quantities of unsound food at family gatherings. Regular

consumption of high-calorie foods, fat, and sugar will result in additional weight gain. Other than that, according to Chen Yun et al (2018), missing breakfast is also linked to weight gain and a higher BMI.

Physical Inactivity

Physical inactivity is defined as a lack of moderate to heavy exercise in one's daily activities. You are deemed physically inactive if you do not move your body or are not actively working for a long period of time. Passive activities include sitting or lounging on the couch while watching TV, as well as sitting at a workstation. Aside from that, inactivity is described as a lack of physical activity or a struggle to satisfy the physical activity standards. Sitting at the house, for study, for vacation, or during free time might also be termed physically inactive since their bodies have received little activity.

Obesity is linked to a lack of physical exercise, which increases the bad health effects of obesity (Kravitz et al., 2016). Besides that, people can maintain or even decrease weight by increasing their overall calorie intake through physical activity. Other that, physical activity helps to reduce weight around the hips and general body fat, which helps to prevent the progress of abdominal obesity. For example, weightlifting, push-ups, and other muscle-reinforcing activities can improve body energy, making the reducing weight process easy even on rest days. Physical activity helps reduce depression and anxiety, and people are more likely to keep to their fitness routines over time as a result of their better mood.

Stress

Stress can affect people's emotions, psychology, and social well-being. The relationship between an individual and the environment that one perceives as taxing or exhausting resources and jeopardizing health is classified as stress. Many different forms of emotional issues might induce stress (e.g., unemployment or illness). Chronic and acute stress are two types of stress. Chronic stress is a long-term reaction to psychological stress (e.g., work stress). While acute stress has been connected to a person's ability to engage the mechanism, it has also been linked to an increase in appetite. This can lead to obesity and overweight in the long term, especially in women (Poulsen et al., 2019).

It requires an overall country analysis to identify the risk factors and consequences of obesity problems due to stress problems. Stress can alter behaviour by causing overeating and high-calorie, high-fat, or high-sugar meals to be consumed, as well as restricting physical activities and sleeping less. According to Van der Valk et al., (2018), show that due to the diverse qualities of glucocorticoids, stress can contribute to body weight increase in a variety of ways. High cortisol levels can stimulate appetite and cause white adipose tissue to be redistributed to the belly, resulting in abdominal obesity. Furthermore, exogenous glucocorticoid treatment boosts cortisone-to-cortisol conversion in the liver, which potentially leads to obesity. Sleep or works shifts are disrupted as a result of glucocorticoids, and this could lead to greater effects causing certain people to be more susceptible to obesity and overweight.

Obesity among adults in Malaysia

One of the worldwide issues is obesity. It is a chronic disease that affects people of all ages. Obesity is common among children and adults. Obesity is a severe metabolic disorder that is linked to cardiovascular disease (CVD), in both developed and developing nations, as well as there is a risk of dying. Malaysia is ranked first in the rate of adult obesity in South East Asia. The obesity rate in 2011 among adults in Malaysia was 15.1 percent (Davey et al., 2013). In

epidemiological studies, the body mass index (BMI) is a method to identify health status (Chooi et al., 2019).

Obesity happens when there is an imbalance of calorie intake and calorie expenditure. The excessive consumption of energy, particularly fat and sugars, must be burned off; otherwise, the excess energy will be stored in the body as fat. According to Bessesen, (2008), obesity is defined as a level of excessive weight that will cause negative health effects. People can determine their health status by calculating their Body Mass Index (BMI) by dividing their weight (kg) to their height (m2). If a person is obese then their body mass index (BMI) is greater than 30.0 kg/m2. Being overweight is when having a BMI between 25.0 and 29.9 kg/m2, whereas BMI around 18.5 to 24.9 kg/m2 shows normal (James et al., 2001) (Table 1).

Table 12: WHO classification of obesity

Classification	BMI (kg/m2)	Risk of comorbidities
Underweight	18.5	Low (but the risk of other clinical problems increased)
Normal range	18.5 to 24.9	
Overweight	≥ 25	Average
Pre-obese	25.0 to 29.9	
Obese class 1	30.0 to 34.9	Increased
Obese class 2	35.0 to 39.9	Moderate
Obese class 3	≥40.0	Severe
		Very severe

Comorbidity risk	WAIST CIRCUMFERENCE (CM)	
	WOMEN	MEN
Above action level 1	≥80	≥94
Above action level 2	≥88	≥102

Source: Journal of the American Medical Association (2001).

People need to know their BMI. It will lead them to see whether their weight is proportionate to their height. Being aware of the BMI can help one to identify any health risks that may be faced if it exceeds the healthy range. Excessive body weight is linked to many health issues such as diabetes, coronary heart disease, and non-alcoholic fatty liver disease, as well as a higher risk of disability.

Research Hypotheses

The study's hypothesis is to see whether there is a significant factor between the dependent and independent variables.

H1	**There is a significant association between eating habits and obesity among adults in Malaysia.**
H2:	There is a significant association between physical inactivity and obesity among adults in Malaysia.
H3	There is a significant association between stress and obesity among adults in Malaysia

Research Framework

Figure 1 below shows the research framework of this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

This study employed a quantitative approach by using a set of questionnaires to collect the data. The questionnaires were distributed via online platforms such WhatsApp, Instagram and Facebook. The target population was adults in Selangor, Malaysia. The questionnaires is designed to collect all information relevant to this study's objectives. Likert-Scale was used to determine the independent and dependent variables. The options range from 1 to 5, with 1 being firmly disagreed and 5 being strongly agree. The Statistical Package Social Science (SPSS) version 26 was used to interpret all the results. SPSS is a program that evaluates, transforms, and creates a distinctive pattern from a collection of data variables.

Data Collection

In the first stage, this study involved primary data collection using questionnaires via Google Forms, which were distributed to 384 respondents who participated in this study. The questionnaires were constructed using Google Forms and were distributed via online platforms such as WhatsApp, Instagram, and Facebook. This research used Google Forms is chosen because it can reduce the cost and it is easier for people to respond to the questions. The questionnaires were divided into 5 sections which are section A, section B, section C, section D, and section E. Section A discusses socio-demographics (gender, age, ethnicity, marital status, education background, employment status, and monthly income). Section B, section C, and section D are about the factor that causes obesity among adults such as eating habits, physical inactivity, and stress. Finally, section E is about obesity.

Sampling

This research was conducted through a quantitative method, which included the use of an online survey questionnaire and a Google form. The participants in this study were identified using a convenience sampling method. The participants that were involved in this study are adults who live in Selangor. A non-probability convenience sampling method was chosen as the sampling technique. Furthermore, the non-probability sampling approach was used in this study since it

reduced time and money for the researchers when collecting data. To obtain a reliable and valid sample for this study, the researchers used Krejcie & Morgan's (1970) equation to determine the sample size.

Data Analysis

This study evaluated the primary data through the Statistical Programmers for Social Science (SPSS) version 26.0 to show the relationships between the dependent variable and the independent variables. SPSS is a program-based window for data entry and analysis that makes it easy to create tables and pie charts. Researchers were able to reduce the time needed to calculate data and perform quantitative analysis more quickly and. The researcher uses descriptive statistics, reliability statistics, and the Pearson correlation coefficient to analyse the data.

FINDINGS

Results of Frequency Analysis

There were 384 respondents involved in this study are adults in Malaysia. The distribution of the respondents in terms of their background characteristics were analysed using descriptive statistics involving frequency and percentage. The results are shown in Table 2.

Table 2: Frequency Analysis

Characteristics	Frequency	Percentage (%)
Gender		
Male	128	33.3
Female	256	66.7
Age		
18-27 years	226	58.9
28-37 years	79	20.6
38-47 years	50	13.0
Above 48 years	29	7.6
Ethnicity		
Malay	241	62.8
Indian	86	22.4
Chinese	42	10.9
Others	15	3.9
Marital status		
Married	124	32.3
Single	252	65.6
Divorced	8	2.1
Level of education		
Illiterate	1	0.3
Primary school	1	0.3
Secondary school	62	16.1
Diploma	125	32.6
Degree	167	43.5
Others	28	7.3
Employment status		
Student	194	50.5
Self-employed	48	12.5
Employed	137	35.7
Unemployed	5	1.3

Monthly income		
No income	187	48.7
Less than RM1500	68	17.7
RM1500- RM4000	100	26.0
Above RM4000	29	7.6

Table 2 above shows the distribution of respondents' background characteristics which are gender, age, ethnicity, marital status, level of education, employment status, and monthly income. There are 128 male respondents (33.3%) and 256 female respondents (66.7%) among the 384 total respondents. The age distribution of respondents are 226 (58.9 %) between the ages of 18 and 27, 79 (20.6 %) are between 28 and 37, 50 (13.0 %) are between 38 and 47, and 29 are over the age of 48. (7.6%). Besides that, 241 (62.8 %) are Malay, 86 (22.4 %) are Indian, 42 (10.9%) are Chinese, and 15 (3.9 %) are others. According to the marital status of the respondents, 124 (32.2 %) are married, 252 (65.6 %) are single, and 8 (2.1%) are divorced.

In terms of education, 1 (0.3 %) of respondents are illiterate, 1 (0.3 %) only attended primary school, 62 (16.1 %) only attended secondary school, 125 (32.6 %) obtained a diploma, 167 (43.5 %) obtained a degree, and 28 (7.3 %) are other types of educations. According to respondents' backgrounds based on their employment status, 194 (50.5%) are students, 48 (12.5%) are self-employed, 137 (35.7%) are employed, and 5 (1.3%) are unemployed. According to the analysis of respondents' monthly income, 187 (48.7 %) have no income, 68 (17.7 %) have less than RM1500, 100 (26.0 %) have income ranging from RM1500 to RM4000, and 29 (7.6 %) have income exceeding RM4000.

Results of Descriptive Analysis

Table 3 below shows the descriptive analysis of the factors that cause obesity among adults in Malaysia (N=384).

Table 3: Descriptive Analysis

Variables	Items	Mean Score	Standard Deviation
Eating habits	Eat meals regularly daily	4.07	1.055
	Do you eat vegetables on a daily basis?	3.87	1.175
	Do you consume breakfast on a daily?	3.87	1.219
	Do you practice healthy eating every day?	3.75	1.250
	Do you consume fry food regularly?	3.97	1.040
	A snack in between regular meals is a must.	3.97	1.132
	The intake of regular meals is more than 3 meals per day.	3.85	1.143
	Daily water intake is more than 1 litre.	4.07	1.103
	I frequently consume fast food.	3.90	1.161
	Do you agree that eating habits are linked to obesity?	4.68	0.576
Physical inactivity	I am engaging in physical activities daily?	3.55	1.374
	Do you do some light physical activity every week?	3.97	1.127
	Doing physical activities for 30 minutes?	3.79	1.180
	Do you do physical activities at home?	3.90	1.153
	Do you like to do physical activities?	4.01	1.092
	Do you walk around the neighbourhood?	3.65	1.347
	Does exercise cure obesity?	4.49	0.658
	Doing physical activities at home is the best choice?	4.16	0.970

	Do you think physical inactivity causes obesity	4.70	0.586
Stress	Do the weight scales have great power over you? Can they change your mood?	4.26	0.874
	Have you been feeling down, stressed, depressed, or hopeless in the last two weeks?	3.89	1.130
	Is it difficult for you to stop eating sweet things, especially chocolate?	3.89	1.121
	Do you crave specific foods when you're stressed?	4.07	1.006
	Do you eat more of your favourite food and with less control when you are alone?	3.94	1.122
	Do you eat a lot when you're stressed?	4.03	1.069
	Do you engage in physical activities when you are stressed?	3.51	1.384
	Are you stressed about your body size and physical appearance?	4.16	1.002
	Are you feel stressed when someone teases your body size?	4.29	0.878
	Do you agree that stress can contribute to obesity?	4.60	0.690
Obesity among adults in Malaysia	What is your Body Mass Index (BMI) category? - Underweight - Normal - Overweight - Obesity	2.66	0.888
	Obese people are as happy as non-obese people. Do you agree?	3.46	1.454
	Most obese people feel that they are not as good as other people.	4.20	0.935
	Obesity is a problem for many adults in Malaysia nowadays. Do you agree?	4.57	0.614
	Obese people are just as healthy as non-obese people.		
	One of the worse things that could happen to a person would be for him to become obese.	3.28	1.555
	Very few obese people are ashamed of their weight.	4.29	0.780

Table 3 shows the mean and standard deviation for twenty-nine statements under three independent variables and seven statements under the dependent variable based on the survey involving 384 respondents. The highest mean value for the eating habits factor was obtained by Question 10 with 4.68, where the respondents agreed that eating habits are linked to obesity. The lowest mean value belonged to Question 4 with 3.75, where the respondents agreed that practice healthy eating every day. As for the factor of physical inactivity, the highest mean value was obtained by Question 9 with 4.70, where the respondents agreed that physical inactivity causes obesity. The lowest mean value belongs to Question 1 with 3.55, where the respondents agreed that they engage in physical activities daily. Meanwhile, the highest mean value for the factor of stress was obtained by Question 10 with 4.60, where the respondents agreed that stress can contribute to obesity. The lowest mean value belonged to Question 7 with 3.51, where the respondents agreed that engage in physical activities when they are stressed. Besides that, the highest mean value for the dependent variable of obesity among adults in Malaysia was obtained by Question 4 with 4.57, where the respondents agreed that obesity is a problem for many adults in Malaysia nowadays. The lowest mean value belonged to question 1 with 2.66, where the question is about respondents' Body Mass Index (BMI) categories which are underweight, normal, overweight, and obesity.

Results of Reliability Analysis

Table 4 below shows the reliability of the analysis. When the alpha value is less than 0.70, it suggests insufficient internal consistency reliability. However, when the alpha value is greater than 0.70, it shows appropriate internal consistency reliability.

Table 4: Reliability Analysis

Variables	Number of Items	Cronbach Alpha
Eating habits	10	0.839
Physical inactivity	9	0.874
Stress	10	0.855
Obesity among adults in Malaysia	7	0.703

Table 4 shows the results of reliability statistics for the independent variables and dependent variables. In order to measure the eating habits variable that influences eating habits among adults in Malaysia, 10 questions were constructed. It is shown that the Cronbach's Alpha result for this question was 0.839 which was acceptable and very good. Thus, the coefficient obtained for the questions in the eating habits variable was reliable.

In order to measure of physical inactivity variable that influenced physical inactivity among adults in Malaysia, 9 questions were constructed. It was shown that the Cronbach's Alpha result for this question was 0.874 which was acceptable and very good. Thus, the coefficient obtained for the questions in the physical inactivity variable was reliable.

To measure the stress variable that influenced stress among adults in Malaysia, there were 10 questions constructed for this section. It was shown that the Cronbach's Alpha result for this question was 0.855 which was acceptable and very good. Thus, the coefficient obtained for the questions in the stress variable was reliable.

In order to measure obesity among adults in Malaysia, 7 questions were constructed for this section. 0.703 were shown for the Cronbach's Alpha result for this question which was acceptable and good. The coefficient obtained for the questions was reliable and the research can be continued.

Results of Pearson Correlation

Table 5 below shows the Pearson Correlation. According to table 5, the Pearson Correlation association between eating habits, physical inactivity, stress, and obesity among adults in Malaysia.

Table 5: Pearson Correlation

Hypothesis	p-Value	Result (Supported/ Not supported)
H1: There is a significant association between eating habits and obesity among adults in Malaysia.	0.625	H1 is supported
H2: There is a significant association between physical inactivity and obesity among adults in Malaysia.	0.559	H2 is supported

H3: There is a significant association between stress and obesity among adults in Malaysia.	0.620	H3 is supported

H1: There is a significant association between eating habits and obesity among adults in Malaysia.

Eating habits and obesity among adults are independent and dependent variables, respectively. Eating habits have been determined as obesity problems. It shows that there is a significant relationship between eating habits and factors that influence obesity among adults in Malaysia. The Pearson's correlation value was 0.625 which stipulated the intensity of the moderate positive relationship between eating habits and obesity among adults in Malaysia.

H2: There is a significant association between physical inactivity and obesity among adults in Malaysia.

There is a significant relationship between physical inactivity factors that influence obesity among adults in Malaysia. The Pearson's correlation value was 0.559 which showed the intensity of the moderate positive relationship between physical inactivity and obesity among adults in Malaysia.

H3: There is a significant association between stress and obesity among adults in Malaysia.

In this hypothesis, stress and obesity among adults are independent and dependent variables. Stress has been determined as mental health. The result indicated that there is a significant relationship between stress factors and obesity among adults in Malaysia. The Pearson's correlation value was 0.620 which showed the intensity of the moderate positive relationship between stress and obesity among adults in Malaysia.

DISCUSSION AND RECOMMENDATIONS

The discussion objective of the research study is to determine the relationship between eating habits, physical inactivity, and stress that influence obesity among adults in Malaysia. The result of the data shows that there is a moderate relationship between the independent variables which are eating habits, physical inactivity, and stress, and the dependent variable which is obesity among adults in Malaysia. In addition, eating habits have the highest correlation compared to physical inactivity and stress based on the values of Pearson Correlation which is represented by the correlation $(0.625 > 0.559 < 0.620)$. All the hypotheses stated are supported.

There are several recommendations to this study. This study only focused on one state which is Selangor. Therefore, there are several areas in which future research should undertake. Moreover, obesity prevention will require a better understanding of the causative factors for obesity which influence behaviour and the social and cultural environment (Ramachandran & Snehalatha, 2010). Other than that, this study also suggests that future studies may focus on children of school age to predict the risk of persisting obesity (James, 2004).

CONCLUSION

In conclusion, this study is completed to determine the factors that cause obesity among adults in Malaysia. This study mainly focused on adults in Selangor, Malaysia. There were 384 respondents who participated in this study. This study focused on three factors to investigate the significant factors that cause obesity among adults in Malaysia which are eating habits, physical inactivity, and stress. This study uses descriptive statistics, reliability statistics, and Pearson correlation coefficient to analyse the data by using SPSS Version 26. Other than that,

this study employs a quantitative method by distributing questionnaires in google form through social media such as WhatsApp, Instagram, and Facebook. Based on the finding, eating habits have the highest correlation compared to physical inactivity and stress based on the values of Pearson Correlation which is represented by the correlation (0.625 > 0.559 < 0.620). The study concluded that eating habits, physical inactivity, and stress have a moderate positive relationship to causing obesity among adults in Malaysia.

ABSTRACT

Time management is a crucial aspect of living a healthy lifestyle especially for students. Time management entails properly managing time in order to complete daily tasks and feel content with the results. The purpose of this study is to investigate the factors affecting time management among year 2 students at Universiti Malaysia Kelantan, City Campus. The researchers use a quantitative technique and questionnaires in Google Forms to conduct this survey. In the study, the researchers used the Time Management Questionnaire (TMQ) test as to collect the data. A Statistical Package for Social Sciences (SPSS) version 25.0 is used to analyse the data. The findings were summarized to reveal that performance behaviour conduct has the largest correlation factors, followed by academic performance, and social media has the lowest correlation.

Keywords: Time Management, Performance Behaviour, Academic Performance, Social Media, Student.

INTRODUCTION

Students will often not manage their time as well as they should in order to reach their goals. Time management is the ability to organise, plan, arrange, and account for one's time in order to increase production and efficiency at work (Aduke et al., 2015). A variety of skills, methods, and approaches used to manage time when completing various tasks, projects, and goals can assist with time management. This process consists of a collection of tasks including planning, goal setting, delegation, time-tracking, monitoring, organising, scheduling, and prioritising. Initially, time management did not refer only to time management, but also to the use of time. Individuals that are competent to manage their time would prioritise the numerous activities they are faced with, focusing their time and attention on the most important ones first.

Time management skills are skills that students in higher education institutions must master in order to effectively manage and control distractions. Without time management, success is impossible to achieve. To obtain effective time management skills, students can use the diary as a guide to establish information and techniques of time boxing to complete the assigned tasks and thus can influence decision making and priorities set (Alvarez et al., 2019).

The following are the objective of the study:
1   To investigate the factor of performance behaviour that influences time management among year 2 students at Universiti Malaysia Kelantan, City Campus.
2   To investigate the factor of academic performance that influences time management among year 2 students at Universiti Malaysia Kelantan, City Campus.
3   To investigate the factors of social media used that influences time management among year 2 students at Universiti Malaysia Kelantan, City Campus.

Significance of the Study

Time Management

This study is going to cover students the major factors time management. Having good time management skills gives students the ability to plan ahead and prioritize upcoming assignments and events. This is an important factor in avoiding procrastination and keeping students organised and ultimately leads to academic success.

Student

Students need to be aware of the importance of time management in their daily lives. Effective time management allows students to complete more in less time, because their attention is focused, and they are not wasting time on distractions. Students should make the best use of their time. Students can complete their work on time, stay engaged in their learning, and have more time for activities that are important to them, such as sports, hobbies, and spending time with friends and family if they use time efficiently. Good time management can produce disciplined students.

Future Researchers

This study can help future researchers to improve the understanding of the variables that affect time management among students from the aspect of performance behaviour, academic performance and social media. The students would understand the importance of time management to help with their lifestyle. Besides that, this study will help students who struggle with time management to gain knowledge that will enable them to take time management as a priority.

LITERATURE REVIEW

Time Management

Effective time management is one of the most important parts of a healthy lifestyle. The term "time management" is often used to characterise a person's talent. The use of time handled by an individual is referred to as time management abilities. Positive time management has been linked to intrinsic motivation, according to research. It also adds that different people have different features and nature when it comes to time management. Time management shows that it is very closely related to behaviour time management (Khan et al., 2016). Effective time management allows a person to govern and manage everyday tasks such as work, learning, and other responsibilities. When an individual knows the amount of time spent on a specific task, time management can increase the efficiency and product quality of an activity.

Performance Behaviour

Behaviour refers to exposure to negative or positive forms of behaviour and is systematically more psychological in nature (Halim et al., 2017). Social symptom characteristics such as gangsterism, vandalism, and smoking have been linked to performance behaviour. The rise of the internet world, which has tremendously influenced students, can also contribute to behaviour performance in time management.

The presence of internet games is among them. These games have the potential to obstruct learning. This is because online games have an addictive nature or carry opium (Ariantoro, 2016).

As a result, students who are already acquainted with online gaming are more likely to be influenced, either directly or indirectly. University students are especially vulnerable to the influence that video games might have on them. They should spend their time relaxing or doing

something that benefits them. Peer influence has a significant impact on a developing adult. Peers have an influence on students' time management performance behaviours.

Academic Performance

In today's society, time is considered an infinitely divisible and usable commodity. It contributes to the institution's instillation of a sense of time. Students who do not establish effective habits like motivation, metacognition, and self-regulation are more likely to perform poorly in the future and will find it more difficult to change. Students with ineffective habits like motivation, metacognition, and self-regulation find it more difficult to change their performance in the future and are more likely to perform poorly.

University students frequently worry that they will not have enough time to complete a project before the deadline, which can lead to frustration and a lack of enthusiasm. Students must learn to manage their time so that they can concentrate on their studies (Sharma et al., 2016). Students must be able to manage their time effectively in order to earn high grades. The capacity to effectively manage time is crucial to a student's academic success. Students, on the other hand, typically face task aversion and uncertainty, which causes them to procrastinate owing to a lack of organisational skills.

As a result, students will be unable to prioritise their obligations, making them easily distracted and procrastinate. Time management is critical for each university student. To be more productive, people manage their time in a variety of ways. Some people have the capability to manage their time successfully. Certain time management strategies and techniques can aid your success. Academic performance is supported by excellent time management (Adebayo, 2015). Effective time management improves academic performance while simultaneously lowering anxiety and stress levels in kids (Adams & Blair, 2019).

Social Media

In this age of globalisation, social media has gone viral among Malaysian adolescents. Nowadays, teenagers believe that engaging in social media is a requirement and that it has a substantial impact on their lives. The role of social media in human life has grown to incorporate a broader range of educational opportunities, both academically and as a source of debate starters for students. It is evident that social media has a significant impact on individuals. Because of social media, someone who was insignificant before can now become significant, and vice versa (Putri et al. 2016).

Humans have invented a variety of technical solutions to make living easier. For other people, social media is their primary source of amusement. Because of the lack of face-to-face interaction, persons who are lonely are more prone to resort to social media to help them cope. You can use various tools on social media that do not require you to interact with people in person but can still bring people together. Using social media, teenagers can learn about business and develop an interest in becoming entrepreneurs. Many of today's young entrepreneurs run their enterprises via social media. People who use social media find it easier to buy products without having to leave their homes, as now they can order anything they want or need in just one click. Many teenagers today engage in social media without realising that if they are continually engrossed in it, they will lose touch with their peers. Adolescents who have lately become hyperactive on social media in cyberspace try to flaunt their everyday lives frequently in order to avoid appearing obsolete or scurvy (less up-date) (Putri et al. 2016) and the ease with which different sources can be found is what makes social media a constant requirement. This social disturbance benefits the community, but it has a harmful influence on adolescents.

Another effect of social media is an increase in teen cyberbullying and jealousy based on what their classmates post on social media. The most significant result of social media's rapid expansion is the lack of social contact with other individuals. Many teens today use social media without recognising that if they remain glued to their smartphones, their social relationships would be severed.

Research Hypothesis

The study's hypothesis is to determine whether there are any correlations or relationships between dependent variable (DV) and independent variables (IV).

H1: There is a significant relationship between performance behaviour and the factor affecting time management among Year 2 students at Universiti Malaysia Kelantan, City Campus.
H2: There is a significant relationship between academic performance and the factor affecting time management among year 2 students at Universiti Malaysia Kelantan, City Campus.
H3: There is a significant relationship between social media used and the factor affecting time management among Year 2 students at Universiti Malaysia Kelantan, City Campus.

Research Framework

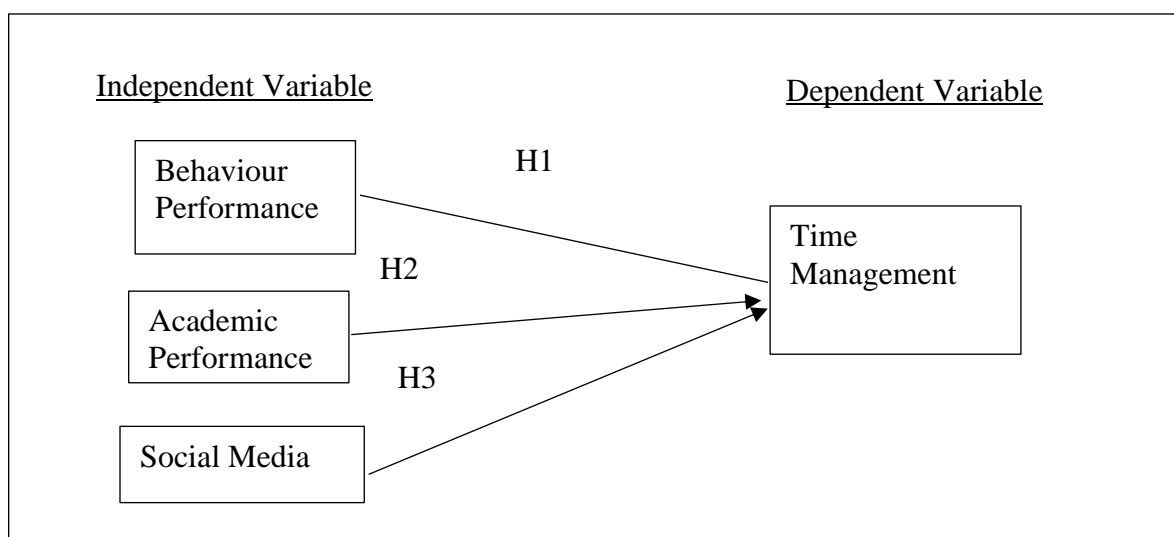
Figure 1 below shows research conceptual framework of this study.


Figure 1: Research Framework

METHODOLOGY

Research Design

The planning process, including the strategy and technique in acquiring and evaluating data, was covered in this phase of the research. It is the cornerstone of a research plan. The information for this study were gathered using a survey. This questionnaire was the primary instrument for collecting data on the variables from respondents. In this study, all data gathered from respondents will be utilised as the main information. For this study effort, 674 second-year students from Universiti Malaysia Kelantan City Campus in Kelantan, Malaysia, were polled.

Data Collection

This questionnaire to collect data regarding performance behaviour, academic performance, and social media. The questionnaires were set in Google Form and were sent to the respondents online. The questionnaires were distributed to the respondents during the weekend in order not

to disturb their schedule. The data collection was completed in less than ten minutes, as it has been observed that there is no interruption for the respondents present in the survey.

Sampling

The research usde the non-probability approach because the samples were not chosen at random. The number of respondents is approximately 169 respondents of years 2 students at Universiti Malaysia Kelantan which is based on Krejcie and Morgan (1970) formula to determine the sample size. The formula of the equation to the evaluate the sample is as follows:

$$\frac{x^2 Np(1-p)}{e^2(N-1) + X^2 p(1-p)}$$

n = sample size
N = population size
e = the degree of accuracy expressed as proportion (0.05)
x2 = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

For this data analysis, the researchers collected the data using frequency analysis, descriptive analysis, reliability analysis, and correlation test analysis. To collect the data, the researchers use a Statistical Package for Social Science (SPSS) designed version 25.0 to show the relationships between the dependent variable and the independent variable as a set of statistical approximated by regression analysis.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the result of frequency analysis.

Table 1: Result of Frequency Analysis

Demographic Characteristic	Frequency (n)	Percentage (%)
Gender		
Male	45	38.1
Female	73	61.9
Age		
18-21 years old	18	15.3
22-25 years old	100	84.7
Race		
Malay	110	93.2
Chinese	2	1.7
Indian	3	2.5
Other	3	2.5
Religion		
Muslim	114	96.6
Christian	4	3.40
Nationality		
Bumiputra Malaysia	118	100.0
Marital Status		
Single	110	93.2

Variable	Items		
Married		8	6.8
Educational Level			
Degree		118	100.0

Table 1 shows the result of demographic characteristics. The research focused on second-year of Wellness students and the majority of the respondents with 73 female (61.9%) while the male respondents 45 (38.1%). In term of the respondents' age shows 18 respondents between 18-21 years old (15.3%), and 100 respondents (84.7%) are aged 22-25 years old. Analysis of respondents' background in terms 110 (93.2%) are Malay respondents, 2 respondents (1.7%) Chinese, 3 respondents (2.5%) Indian while another 3 respondents (2.5%) from other races. The respondents based on their religion 114 (96.6%) Muslim and 4 (3.40%) of them Christian. In terms of nationality, all respondents Bumiputera Malaysia (100 %). For marital status, 110 (93.2%) respondents single and only 8 (6.8%) of the respondents married. The respondents' based on the educational level all in Degree level (100 %).

Result of Descriptive Analysis

Table 2 below shows the result of the descriptive analysis.

Table 2: Result of Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
IV1: Performance Behaviour	Do you make constructive use of your time?	3.88	1.160
	Do you believe that there is room for improvement in the way you manage your time?	3.83	1.101
	Do you feel you are in charge of your own time, by and large?	3.88	0.976
	Are you able to make minor decisions quickly?	3.78	0.950
	Generally, do you think you can usually accomplish all your goals for a given week?	3.79	0.983
	Do you often find yourself doing things which interfere with your school work simply because you hate to say "no" to people?	3.74	0.953
	Do you find yourself waiting a lot without anything to do?	3.91	0.882
IV2: Academic Performance	I make a list of the things that I have to do each day.	3.91	1.050
	I make a schedule of the activities that I have to do on work days.	3.61	1.012
	I plan the day before I start it.	3.74	1.014
	I write a set of goals for myself for each day.	3.79	0.974
	I review my class notes, even when a test is not imminent.	3.71	1.021
	The night before a major assignment is due, I still working on it.	3.81	0.951

	When I have several things to do, I think it is best to do a little bit of work on each one.	3.89	0.981
IV3: Social Media Use	I often think about social media when I am not using it.	3.89	1.057
	I often use social media for no particular reason.	3.94	1.015
	I lose track of how much I am using social media.	3.84	0.911
	The thought of not being able to access social media makes me feel distressed.	3.85	0.839
	I interrupt whatever else I am doing when I feel the need to access social media.	3.88	0.988
	Arguments have arisen with others because of my social media use.	3.78	0.959
	I feel connected to others when I use social media	3.94	0.913
DV: Time Management	I manage time by completing all my daily activities that I have already planned.	3.87	0.882
	I'm always on time.	3.89	1.024
	I manage time by doing my daily activities.	3.99	0.800
	When interruption occur, I am able to resume my work quickly.	3.88	0.859
	I am confident in many situations.	3.87	0.965
	I have enough time and space to do the work without interruption.	3.95	0.999
	I make good use of time while surfing the internet like social media.	3.94	1.031

Table 2 shows the result of mean and standard deviation for all variable based on the survey involving 118 respondents. The mean and standard deviation derived was for twenty-one statements under three independent variable and seven statements under the dependent variable. The highest mean score for Performance Behaviour which the first independent variable was question 7 with (M=3.915, SD=0.8826), and the lowest mean score was question 6 with (M =3.745, SD= 0.9535). Based on Academic Performance for the second independent variable, the highest mean score was question 1 which was (M= 3.915, SD= 1.0506) and the lowest mean score for academic performance belonged to question 2 which was (M=3.618, SD= 1.0120). Meanwhile, the highest mean score for the Social Media which was third independent variable was obtained by question 7 which was (M = 3.949, SD = 0.9137). However, the lowest mean score was Social Media with (M =3.788, SD= 0.9594). Next, the highest mean score for the dependent variable of time management among second-year students was question 3 with (M = 3.991, SD = 0.8006) and the lowest for mean score of time management was question 1 with (M =3.872, SD= 0.8823). Where the respondents who agreed on the independent variable and dependent variable were the ones that affected time management among year 2 students at Universiti Malaysia Kelantan.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis.

Table 3: Result of Reliability Analysis

Variable	Number of Items	Cronbach's Alpha
Time Management	7	0.863
Performance Behaviours	7	0.845
Academic Performance	7	0.823
Social Media Use	7	0.782

Table 3 shows the result of the reliability analysis. The data were measured using Cronbach's Alpha for all variable and following the questions for each variable with 7 questions. The value of Cronbach's Alpha for time management which dependent variable was 0.863. Meanwhile, the value of Cronbach's Alpha for Performance Behaviour was 0.845. For the second independent variable, the value of Cronbach's Alpha for Academic Performance was 0.823 and the third independent variable which is Social Media with the value of Cronbach Alpha being 0.782. The result of all variable has high reliability and considered excellent respondent reliability.

Result of Pearson Correlation

Table 4 below shows the result of Pearson Correlation.

Table 4: The Result of Pearson Correlation

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: There is a significant relationship between performance behaviour and the factor affecting time management among Year 2 students at Universiti Malaysia Kelantan, City Campus.	0.000	H1 is supported.
H2: There is a significant relationship between academic performance and the factor affecting time management among year 2 students at Universiti Malaysia Kelantan, City Campus.	0.000	H2 is supported.
H3: There is a significant relationship between social media used and the factor affecting time management among Year 2 students at Universiti Malaysia Kelantan, City Campus.	0.000	H3 is supported.

Table 4 shows the result of Pearson Correlation. The first hypothesis indicates the relationship between performance behaviour and time management. Based on result, the Pearson Correlation for the first hypothesis was 0.796 which that p-value of 0.000 is strong positive correlation and the hypothesis is supported. The second hypothesis indicates the relationship between academic performance and time management. The result showed Pearson Correlation was 0.718 which means that p-value of 0.000 is strong positive correlation and the hypothesis is supported. Meanwhile, the third hypothesis show the relationship between social media use and time management. The result showed the Pearson Correlation was 0.713 which means that

p-value 0.000 is strong positive correlation and the hypothesis supported because the p-value is less than 0.05. Thus, the null hypothesis is rejected.

DISCUSSION & RECOMMENDATIONS

The first suggestion is that in the future study, expanding the target group to include all students in years 3 and 4 may aid in achieving the greatest results. This is because students have already learnt and are accustomed to time management in all settings involving study. It could help future studies produce more effective results.

The second proposal is that the researchers can use a range of survey approaches to respond to the questionnaires. For example, to get the fastest response from respondents, researchers can use face-to-face personal interviews and telephonic surveys. Respondents will be able to ask questions and receive rapid responses concerning the study during the personal interview and telephonic survey. Simultaneously, it will increase respondents' awareness and understanding of the need of effective time management. If multiple survey methodologies are applied, the results will be more accurate and practical.

The final proposal is that researchers can use a variety of languages for the questionnaire in future studies, such as Mandarin and Tamil. The questionnaire was written in English and Malay in most parts. This multilingual feature can help people of many races and languages understand and answer to the question without feeling pressured. As a result, the final product will be more consistent and effective.

CONCLUSION

The research focuses on the factors that influence time management among second-year students at Universiti Malaysia Kelantan, City Campus. Performance behaviour, academic performance, and social media used are the independent variables. The dependent variable of time management is influenced by these variables. There is a significant link between the three independent variables and the dependent variables. The Statistical Package for Social Sciences (SPSS) version 25.0 computer application was used to analyse the data. According to the data, performance behaviour has the strongest link, followed by academic performance, and social media use has the weakest link. (0.796>0.718>0.713) Three independent variables all had p-values of 0.000. This section offers a few research articles that help to increase the outcome's reliability and strength. The H1, H2, and H3 hypotheses have all been confirmed. The research was limited by a lack of expertise, a lack of interest in questionnaires, and the difficulty of gaining access to second-year students Universiti Malaysia Kelantan, City Campus. The study's recommendations, which include expanding the target population, using more survey methods, and using many languages, will improve future research.

ABSTRACT

Physical activity would be a better method for university students to have a healthy lifestyle. The students as a separation from energetic lifestyle behaviors as well as reduce in physical activity behaviour during in the university stage and the common issue was a lack of time to perform the physical activities. The purpose of this study is to examine the factors that influence physical activity among year 3 students of Universiti Malaysia Kelantan, Kampus Kota. The researchers used a quantitative technique and questionnaires by Google Forms to conduct this survey. Statistical Package Social Science (SPSS) version 26.0 was used as a tool for analysing the data. The findings showed that the most influencing factor was individual factor, followed by family factor and the lowest correlation was university facilities factor. Physical activity through sports and games provided opportunities to build a sport-loving culture, for stress release and the hunt of a healthy lifestyle.

Keywords: Factor Influence, Physical Activity, Family, University Facilities, Individual

INTRODUCTION

Physical activity is defined as the body motion caused by the voluntary muscles that need more energy. The phrase "physical activity" should not be related to "exercise". Physical activity is known as the leading category. Meanwhile exercise is known as a sub-category for physical activity that has been structure. Physical activity includes in any activity that requires body movement, such as house cores, working and other activity (Rajappan et al., 2015). A survey has conduct by the Ministry of Health Malaysia on physical activity through the National Health and Morbidity Surveys. The latest report from National Health and Morbidity Surveys (NHMS) in 2019 shows that 74.9% of Malaysian adults are active in physical activities, the percentage is higher compared to 3 previous year which is on 2006 (56.3%), 2011 (64.8%) and 2015 (66.5%). Moreover, in Malaysia almost 1.7 million people who currently face three (3) main health problems which is high fat, high hypertension, and diabetes (Khoo et al., 2020).

Regular physical activity is vital for a person because the person could have a healthy lifestyle. This has been proved that it aids in the management of non - communicable disease (NCDs) such as pre-diabetes stroke, and heart problem and certain cancers (Abdullah et al., 2021). Physical activity could help a person to maintain they body weight and avoid from being hypertension whereby increase the quality of life of an individual. Therefore, the primary goal of this study is to discover the factor influences of physical activity among students from year 3 Universiti Malaysia Kelantan, Kampus Kota. There are three research objectives for this study:
1. To investigate the relationship between family factor and physical activity
2. To investigate the relationship between university facilities and physical activity
3. To investigate the relationship between individual factors and physical activity

Significance of the Study

Physical Activity

This study covered the significant factors of physical activity among students. There was a strong correlation between body exercise and cardiovascular and also respiratory health, but 150 minutes of moderate or intense exercise per week resulted in a significant risk reduction. Physical activity reduced the risk of affected well-being while it also created and maintained strong bones and muscles, weight control, fear, and depression, and promoted health and a good health.

Students

Students need to emphasize physical activity especially for living a healthy lifestyle in the future. Hence, this study would help the students to realize that physical activity is important for them where it would help them to prevent from the unhealthy lifestyle. Students always need to be involved in physical activity and ensure the community to interest the students participating in doing physical activity to get a healthy lifestyle. Physical activity helps students prevent from illness, increase their immune system and be active in daily lifestyle.

Future Researchers

This study can help future researchers to improve the understanding of the variables that impact physical exercise among students from the aspect of families, university facilities, and individual factors. The students would understand the important of the physical activity to their lifestyle. Besides, this study would be helpful for the students who are not interest in physical activity to gain knowledge which would help them to take physical activity as essential for them.

LITERATURE REVIEW

Family

Parents should understand the reasons why they join in physical activity at university or school. Parents can be role models to their children when they participate in physical activity. In previous research, researchers found that most of the students who performed the best physical activities were from the family with an active background in physical activity like sports. Parents would be main reason for deciding and arranging daily activities for their children. Moreover, parents can support their children by bringing them outside on weekends to do some physical exercise like walking, cycling and more. It would be an enjoyable moment for them.

According to Rachele et al., (2016), children's physical activity increases when their family members join together in physical activities. Moreover, parents can also guide their children by indirectly whereby it might be moderate based on the personal attitudes of the children towards the physical activity. The family should be more supportive and become the role models to their children who get involved in physical activity so that, they can improve the quality of life and inspire them to be active in physical activity and avoid from doing negative activities. Some children are interested to join physical activity with family support. Meanwhile, some children have interested, but their parents do not encourage them to join physical activity.

University Facilities

According to Abdul & Kutty. (2017), the university environment offers far more benefits and chances for students to increase their physical activity. However, unlike primary and secondary schools, university students frequently overlook opportunities to use accessible university facilities efficiently due to a lack of an effective structure for physical health and educational

publicity. A recreational facility is defined as any facility that allows a person to engage in at least one physical activity, such as weightlifting or yoga. To prevent students from being physically inactive, university facilities are critical. University students' physical activity characteristics may be affected by the characteristics of equipment and materials, especially the arrangement of entertainment and physical activity facilities. Even though universities provide facilities, some students do not use them to their full potential (Abdullah et al., 2016).

Physical activity tools are commonly just accessible in major university sports facilities, making these accommodations essential to university students' participation in sports. Over that time, college students judged the free time infrastructure, which contains load rooms, cardiac gym equipment, and pools, as essential amenities and facilities when deciding whether the university to participate (Shaikh et al., 2018). According to Wilson et al, (2020) study, there are differences in how college students use campus recreation facilities, which mirror differences in physical activity levels. Due to the negotiation of gender roles, women's relationships with physical activity are complicated, as attributes fostered by physical activity, such as competitiveness and strength are at odds with stereotyped feminine values.

Individual

Effects were seen in groups of boys and girls, men and women, and senior male and female participants. It's important to remember that contributions reported at the group level may not entirely apply to every group member. Little is known about the uniqueness of responses to long-term regular exercise, chronic sedentarism, or variations in habitual physical activity levels with age. Indeed, most of the evidence has come from controlled exercise trials in which people were subjected to regular exercise of a particular style, intensity, frequency, and duration for weeks or months at a time. The most evident distinction is physical activity that include manual dexterity may differ significantly and in some circumstances such as physical body and health. Physical activities are important for health improvement. Physical activity has been strongly associated with both physical and mental health throughout this period (Abdullah et al., 2016).

We all know that leading a sedentary lifestyle increases the risk of various ailments that affect both men and women as they age. It's even linked to a higher chance of dying young. On the other hand, regular physical exercise in various situations is regarded as a habit that has positive effects on a wide range of health outcomes. The epidemiological, experimental, and clinical data regarding sedentarism's negative impacts and the benefits of a physically active lifestyle will not be discussed here. Positive relationships of physical activity have been found with intention, self-efficacy, perceived advantages of physical activity, and excellent health status. In contrast, negative associations have been found with perceived obstacles to physical activity older age, and female status. Moreover, income disparity, such as income distribution as well as racial discrimination, might have had an impact on the continuous physical motion.

Physical Activity

Physical activity is defined as targeted and consistent motor activity. This function aims to improve one's physical condition, functional state, and overall health. Physical activity is a unique type of human functioning and manifests a person's physical culture (Leifa et al., 2017). Physical activity is widely recognized as necessary in adolescent people's growth and the maintenance of body lifestyle (Saez et al., 2021). On a physical, psychological, aesthetic, and social level, there is currently good research that illustrates the various benefits connected with regular participation in sporting events or physical activity. Daily exercise has also been shown to reduce the risk of fragmentation and bone disorders, decrease the risk of chronic disease, decrease the occurrence of mood and anxiety disorders, and improve health. Roberts et al.,

(2015) found that young people entering university are more likely to have both the time and the opportunity to engage in regular physical activity and exercise.

Physical activity is vital for people of all ages, particularly teenagers and young adults, to maitain good health and avoid chronic diseases. Physical inactivity has been linked to poor cardiovascular and metabolic health, type 2 diabetes, a variety of cancers and increases the level of obesity rates (Li et al., 2016). According to World Health Organization statistics, about 70% of university students don't participate in regular exercise in their leisure time. In addition, high levels of inactivity persist after graduation, raising concerns that university students will become obese in the future. According to Wilson et al., (2020), examined that physical activity disparities have been well documented and are a source of public concern, given the link between physical activity and a reduced risk of various negative physical and mental health consequences.

Apart from that, Abdullah et al., (2021) state that physical activity is essential for maintaining one's health and preventing harmful diseases such as cardiovascular disease, high blood pressure, diabetes, and other ailments. Furthermore, regular physical activity will help a person fight several physical and mental health ailments and conditions. This demonstrates that physical activity at university will improve a student's physical and emotional well-being. According to Wang et al., (2015), a few researchers have associated, teenage physical activity to support from parents, such as inspiring their children to be more physically healthy, observing their own children physical activity and involved in their adolescents' activities.

Research Hypothesis

The hypothesis for this research is to see if there are any significant difference between the independent variable and dependent variable:

H1   There is a significant relationship between family factors that influence physical activity among Year 3 students in Universiti Malaysia Kelantan, Kampus Kota.

H2   There is a significant relationship between university facilities factors and factors influencing physical activity among Year 3 students in Universiti Malaysia Kelantan, Kampus Kota.

H3   There is a significant relationship between individual factors that influence physical activity among Year 3 students in Universiti Malaysia Kelantan, Kampus Kota.

Research Framework

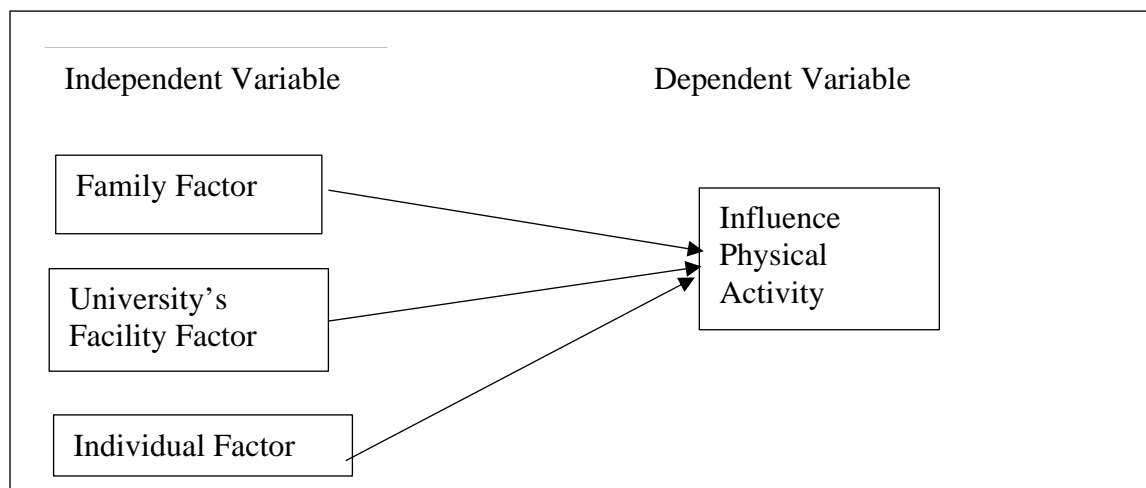
Figure 1 shows the research framework of this study:


Figure 1: Research Framework

METHODOLOGY

Research Design

Research design is a part of plan that will identify the method and procedure for collecting data and analysis the data for this study. In short, it is known as a framework for the research plan. A quantitative technique and questionnaires by Google Forms will be used to conduct a survey. As a result, the sample will put to the test by selecting a location as a sample which will include the university students who studying in Universiti Malaysia Kelantan, Kampus Kota. Students will be choosing as representatives to give feedback towards factor that influence physical activity among student year 3 Universiti Malaysia Kelantan, Kampus Kota.

Data Collection

The knowledge for this study was obtained from primary sources. Primary data are data collected effectively from primary sources by research groups have used questionnaires. The questionnaire used in this study was created using Google Forms. The questionnaire was applied to collect information regarding the influencing factors of student in year 3 in the wellness faculty at Universiti Malaysia Kelantan, Kampus Kota. The factors were family, university facilities and individual.

Sampling

The researcher used the non-probability technique because samples were not chosen at random. The researchers used Krejcie and Morgan's (1970) formula to evaluate sample group to provide an accurate and relevant sample for this study. The respondents consisted of 161 wellness students who were selected from Faculty Hospitality, Tourism and Wellness of Universiti Malaysia Kelantan (FHPK). The researcher chooses third-year Wellness students because they had a broad knowledge related with health and wellness.

$$ s = \frac{x^2 N_P (1 - P)}{e^2 (N - 1) + x^2 p (1 - p)} $$

n = sample size
N = population size
e = the degree of accuracy expressed as proportion (0.05)
x2 = chi-square of degree of freedom 1 and confidence 95% (3.481)
p = proportion of population (if unknown, 0.5)

Data Analysis

Data analysis is known as an evaluating method of assessing records by applying statistical, logical, and analytical. Statistical Package Social Science (SPSS) is used for analysing the data. The SPSS software would be helpful for the researcher to determine an excellent statistical technique to be used. The SPSS data will explain statistics such as cumulative percentage and valid percentage. Researchers used SPSS programmed version 26.0 version to create tables for data entry and analysis. The researcher collected the data from the industry research data gathering as well as performed descriptive analysis, reliability analysis, and correlation analysis.

FINDINGS

Result of Frequency Analysis

The distribution of the respondents in terms of their background characteristics was analyzed using descriptive statistics involving frequency and percentage. Table 1 show the result of the frequency analysis:

Table 13: Frequency Analysis

Characteristics	Frequency (N)	Percentage (%)
Gender		
Male	29	24.6
Female	89	75.4
Age		
18-20 years	3	2.5
21-23 years	108	91.5
24-26 years	7	5.9
Marital Status		
Single	114	96.6
Married	4	3.4
Race		
Malay	106	89.9
Indian	9	7.6
Others	3	2.5
Religion		
Muslim	105	89
Hindu	10	8.5
Others	3	2.5
Active Physically in a Week		
1-2 days	64	54.3
3-4 days	43	36.4
5-6 days	8	6.8
7 days	3	2.5
Most Physical Activity		
Jogging	26	22
Walking	51	43.2
Aerobic	5	4.2
Bicycling	19	16.1
Others	17	14.4
Place Prefer		
Gym	2	1.7
House	54	45.8
University	11	9.3
Public Parks	37	31.4
Others	14	11.9

Table 1 shows the frequency analysis of the respondents. Out of 118 respondents, most of the respondents were females, which accounted for 89 (75.4%) of the total sample. Meanwhile, in terms of age, 18 to 20 years old was 3 (2.5%), 21 to 23 years old were 108 (91.5%) and 24 to 26 years old were 7 (5.9%). As for their marital status, 114 (96.6%) were single and 4 (3.4%) were married. In term of race, 106 (89.9%) were Malay, 9 (7.6%) were Indian and 3 (2.5%) were others. Next, in term of religion, it was revealed that most of the respondents were Muslim

105 (89.0%) while 10 (8.5%) were Hindu and 3 (2.5%) were others. In terms of active physically, 64 (54.3%) were physically active in 1-2 days, 43 (36.4%) were active in 3-4 days, 8 (6.8%) of respondents were active in 5-6 days and 3 (2.5%) respondents in 7 days. The analysis of respondents for the most physical activities done, it was indicated that 26 (22.0%) were jogging and 51 (43.2%) were walking. This was followed by 5 (4.2%) going for aerobic, meanwhile 19 (16.1%) respondents did the cycling activities and 17 (14.4%) going for others physical activities. As for the place preferred, 2 (1.7%) preferred to go to the gym, 54 (45.8%) preferred the house and 11 (9.3%) preferred to go to university. 37 (31.4%) respondents preferred public parks and 14 (11.9%) preferred other places.

Result of Descriptive Analysis

The mean score and standard deviation of the factors are shown in table 2. The factors can be considered low if the mean score is from 1.00 to 1.99 and high if the mean score is from 2.00 to 4.00. Table 2 shows the descriptive analysis of the independent variable for family factor, university facilities factor and individual factor and the dependent variable for physical activity:

Table 14: Descriptive Analysis

Variables	Items	Mean Score (M)	Standard Deviation (SD)
Family Factor	My family members always do exercise with me.	4.09	0.887
	My family members give me a lot of support to get involves in any physical activity.	4.25	0.896
	My family members try to do exercise with me.	4.19	0.857
	My family members always remind me regards my activities.	3.86	1.029
	My family members are my role model.	4.19	0.847
	My family members always plan activity with me.	4.23	0861
	My family member guides me because they have experience	4.19	0.847
	My family member talk about how much they love to physical activity.	4.10	0.861
University Facilities Factor	You feel easy to obtain the necessary facilities from the university to do activity.	4.12	0.944
	You feel satisfied with the environment of universities to do exercise.	4.19	0.870
	The venue and exercise facilities are nearby with your university	4.02	0.924
	You feel there is limited availability of space to do exercise.	4.19	0.819
	The sport facilities provided by university are safe to use.	4.05	0.950
	There facilities are in good condition.	4.19	0.886
	There are enough facilities are provided by the university.	4.12	0.849
	You feel satisfied with facilities that provided by the university.	4.19	0.899
Individual Factor	You have enough time to do activity.	4.14	0.933
	You feel tired from doing physical activity.	4.25	0.784
	The weather bothers you from doing activities.	4.07	0.894

	You feel bored to do physical activity.	4.14	0.899
	You do not like to do any kind of physical activity.	4.05	0.804
	You have a good environment to do activities.	4.21	0.866
	You have a good motivation to do physical activities.	4.11	0.932
	You feel comfortable to do physical activity alone.	4.11	0.835
Physical Activity	I think that I am able to do physical activity every day.	4.09	0.887
	I think physical activity helps to increase personality while reducing emotional stress.	4.19	0.840
	I think I am able spend more time doing physical activity every week.	4.10	0.861
	I think I am able to follow a healthy lifestyle by doing physical activity.	4.24	0.854
	I think physical activity can gives a lot of benefits.	4.25	0.896
	I think physical activity would help to focus more on my study.	4.19	0.857
	I like am to do physical activity at home during leisure time.	4.11	0.913
	I think physical activity can have a stimulating effect on my energy balance and body composition.	4.23	0.851

Table 2 shows the mean and standard deviation for twenty-four statements under three independent variables and eight statements under the dependent variable based on the survey involving 118 respondents. The results in table 2 above shows that item of family factor 2 (My family members give me a lot of support to get involves in any physical activity) has the highest mean score (M = 4.25, SD = 0.896). Meanwhile item of family factor 4 (My family members always remind me regards my activities) showed the lowest mean score (M = 3.86, SD = 1.029). As for the item of university facilities, factor 2 (You feel satisfied with the environment of universities to do exercise) had the highest mean score (M = 4.19, SD = 0.870). Meanwhile, the item of university facilities factors 3 (The venue and exercise facilities are nearby with your university) showed the lowest mean score (M = 4.02, SD = 0.924). Furthermore, the item for individual factor 6 (You feel tired to do physical activity) revealed the highest mean score (M = 4.25, SD = 0.784). Meanwhile, the item of individual factor 5 (You do not like to do any physical activity) scored the lowest mean score (M = 4.05, SD = 0.804). Next, the item for physical activity 5 (I think physical activity can give a lot of benefits) indicated the highest mean score (M = 4.25, SD = 0.896). Meanwhile the item for physical activity 1 (I think that I am able to do physical activity every day) recorded the lowest mean score (M = 4.09, SD = 0.887).

Result of Reliability Analysis
Table 3 shows the results of the reliability analysis of this research.

Table 15: Reliability Analysis

Variable	Number of items	Cronbach's Alpha
Physical Activity	8	0.789
Family Factor	8	0.736
University Facilities Factor	8	0.713
Individual Factor	8	0.718

Table 3 shows the reliability analysis for the dependent variable physical activity with high Cronbach's Alpha values of 0.789 with eight questions. Moreover, the first independent variable is family factor with eight questions showing Cronbach's Alpha value of 0.736. The university facilities factor was the second independent variable with eight questionnaire question where the Cronbach's Alpha result is 0.713. The last independent variable was an individual factor with eight questions with Cronbach's Alpha result 0.718.

Result of Pearson Correlation Analysis

Table 4 shows the result of the correlation analysis of this research.

Table 16: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: There is a significant relationship between family factors that influence physical activity among Year 3 students in Universiti Malaysia Kelantan, Kampus Kota	0.000	H1 is supported
H2: There is a significant relationship between university facilities factors influencing physical activity among Year 3 students in Universiti Malaysia Kelantan, Kampus Kota.	0.000	H2 is supported
H3: There is a significant relationship between individual factors that influence physical activity among Year 3 students in Universiti Malaysia Kelantan, Kampus Kota	0.000	H3 is supported

According to Table 4 the p-value for hypothesis 1 was below 0.05 and the p value was recorded under 0.05. Thus, alternative hypothesis was accepted, and the null hypothesis was refused. The intensity of the relationship between the family factor and physical strength was strong. Hypothesis 2 shows that the significant value was below 0.05 and the p-value was above 0.05. Therefore, the alternative hypothesis was accepted, and the null hypothesis was rejected. The intensity of relationship between the university facilities factors and physical activity was strong. The significant value of hypothesis 3 is above 0.05 and the p-value is below 0.05. Thus, the null hypothesis was rejected, and the alternative hypothesis was accepted. The relationship between individual factors and physical activity was strong.

DISCUSSION AND RECOMMENDATION

The research study aims to determine the relationship between family, university facilities and individual factors that influence physical activity among 3rd- year Wellness students of Universiti Malaysia Kelantan (UMK), Kampus Kota. The result of the data shows a significant relationship between the independent variables which are family, university facilities and individual factors and the dependent variable, which is physical activity. The result of data shows that there is a significant relationship between the independent. Correspondingly, the previous research also shows a connection between family factor, universities facilities factor and individual factor with physical activity. In addition, individual factors have the strongest correlation compared to family factor and university facilities based on the values of Pearson

Correlation, which is followed by family factor and universities facilities factor which is represented by the correlation (0.925 > 0.869 > 0.864).

Furthermore, future investigation into the technique through which researchers respond to questionnaires is suggested. This can make a good outcome even better in the future. Before the researcher can acquire promising survey findings, the respondents must complete the questionnaires. Furthermore, this survey simplifies things because the researcher only needs to provide the questionnaire to the respondents. This survey method can be improved to make it more accurate and practical. The questionnaire should then be made more straightforward and easier to interpret. This is because respondents never read or comprehended the questionnaire before answering it. So, if the questionnaire is simpler and shorter, the respondent will save time. Because of the positive response from the respondent, the outcome may be more successful.

CONCLUSION

This research is about the factor influencing physical activity among Wellness student in Year 3 Universiti Malaysia Kelantan, Kampus Kota. The family factor, university facilities factor and individual factor were to be the independent variables. These variables influenced the dependent variable which was physical activity. There were 118 respondents involved in this research. Each of the respondents is Year 3 Wellness students. The results were analyzed using the Statistical Package Social Science (SPSS) programme version 26.0 computer software. The recapitulation of the findings showed the strongest correlation would be the individual factor, followed by the family factor and the lowest correlation will be the university facilities factors (0.925 > 0.869 > 0.864). It also showed the p value of three independent variables is 0.000. A few research articles in this part make the result more reliable and robust. All the hypotheses H1, H2 and H3 stated are accepted.

ABSTRACT

Stress is a mental illness that happens when a person is in a dangerous situation or faces a threat that affects their mind. The COVID-19 pandemic had a negative effect on students' mental health. This research will investigate the factors that influence stress among wellness students in year 2 at Universiti Malaysia Kelantan, Kampus Kota. This study was conducted using quantitative techniques, and the Student Stress Inventory (SSI) was utilised to determine the level of student stress during the learning process during the pandemic season. The Statistical Package for Social Sciences (SPSS) version 25.0 is the software used to analyse the data. Based on the data findings, the strongest correlation is between academic factors and environmental factors. Personal factors have the lowest correlation.

Keywords: Stress, Environmental Factors, Personal Factors, Academic Factors.

INTRODUCTION

At the end of 2019, the corona virus began to spread throughout the country, including Malaysia. The government has already closed all institutions in Malaysia to control the spread of the virus. The government is taking this approach to ensure the safety of students and related people. The issue of students with covid-19 is heavily emphasized on online learning (Bui et al., 2020; Chandra, 2020). Corona virus disease (COVID-19) has a deep effect on life across the globe and covid-19 also was affects wellness student year 2 in Universiti Malaysia Kelantan, Kampus Kota because students have to start their lessons with online class. Social contacts strongly limited and outdoor activities must be cancelled. People only works from home and stayed at home if they do not have any reason for go out.

The issue of stress among students has become a hot topic of conversation after 2 students died due to the stress of online learning at Universiti Technology Mara (UITM) Kedah and Pahang. This study will make an analysis of the stress for wellness students in year 2 which is the first batch who go through the process of virtual learning at the university. There are three research objectives for this study:

To determine the relationship between environment factor and stress among wellness student year 2 in Universiti Malaysia Kelantan.
To determine the relationship between personal factor and stress among wellness student year 2 in Universiti Malaysia Kelantan.
To determine the relationship between academic factor and stress among wellness student year 2 in Universiti Malaysia Kelantan

Significance of the Study
Student
The benefit of this study can lead the students among wellness student year 2 in Universiti Malaysia Kelantan, Kampus Kota to have a better mental, physical, and other preparation when they are at university or anywhere. So that, they can control their stress.

Future Researcher
Researcher tries to find out either student get stress by environmental factors, personal factor, and academic factors. So, for the next time the student researchers and others can refer to this study to identifying and managing the stresses faced by students. This study also provides to student's knowledge about the main factors in control the stress which can reduce while they performance and learning in university

Community
The results in this study also can give awareness to University Committees and Staff to closely monitor the stress faced by students. In addition, it also brings benefits to Students Affairs, Counselling Unit of university, Ministry of Higher Educations and parents of students. Other organizations that also benefited greatly from this study were the Ministry of Health Malaysia (MOH), the Institute of Health Management, the Public Health Division, health NGOs such as the Malaysian Psychotherapy Association (PPM) and so on. Apart from that, it also provides enlightenment to the surrounding community about the stress that occurs among students so that they are more aware to the situation and can control the situation better.

LITERATURE REVIEW
Stress
There is a common consensus that stress is a natural part of life and is connected with a lot of important physiological, psychological, and behavioural symptoms (Monroe & Slavich, 2016). Stress also can define as a response or response a person in a condition that is perceived as challenges or threats. In other words, stress is self-condition when feeling pressured, threatened, or problem (Li et al.,2016). Therefore, this stress is very closely related to students because it became part of students' academic life due to the various internal and external expectations placed upon to their shoulders. Adolescents are particularly vulnerable to the problems associated with academic as transitions occur at an individual and social level (Reddy et al., 2018). Operationally, it is a component that related with their performance and will be impact at the result of the studies.

Environmental Factors
Studies investigating environmental factors have found that social isolation, loneliness, and a general lack of social support can increase stress (Wang et al., 2020). During the covid-19 pandemic, stress levels among wellness students increased and the environment became one of the causes. Besides, online learning has a negative effect on students' motivation (Abeysekera & Dawson, 2015). Students that are studied in a positive environment tend to be more interested, motivated, and productive of more learning.

Next, students will also feel the stress of a poor internet connection. It can be difficult for them to learn or complete their assignments because of these problems (Essel & Owusu, 2017). That we can see, the use of E-learning is less effective than face-to-face, hence it requires more effective educational and teaching support (Hart et al, 2018). In short, social isolation and poor

internet problems are strongly related to environmental factors that affect the increase in stress levels in wellness students year 2 at Universiti Malaysia Kelantan, Kampus Kota.

Personal Factors

Personal factors also had a negative effect on student stress during the COVID-19 pandemic. For example, financial problems for students whose families have low incomes When students face financial problems, they face learning challenges and financial constraints (Essel & Owusu, 2017). For example, they have to pay for internet data for their learning process, and this problem causes students stress. The student had to find his own money so as not to burden the family.

In addition, there are some students who have to combine employment with their studies. Many students take part-time or short-term jobs throughout their studies. They do it for a variety of reasons, among them to gain experience for the future and others to support their education and themselves financially. According to Wathelet et al., (2020), while working in a university is good for students, it also puts them under a lot of stress, which they may not be able to handle.

Academic Factors

Some students are experiencing stress as a result of the many internal and external pressures they face in their academic lives. It also occurs at various individual and social levels (Reddy et al., 2018). academic stress is closely related to the environment, student assessment and similar responses (Shearer et al., 2015). As a result of many assignments, students may find it difficult to concentrate and critically think when they are trying to finish an assignment (Kotter et al., 2017).

Furthermore, the difficulty of the language is a significant consideration in academic contexts. Students and lecturers can share their knowledge with others through speaking, either face-to-face or via other means of communication like the telephone (Rabagliati et al., 2018). If students do not understand the language used, they will face problems during the academic process. They become frustrated and depressed despite having communicated, and in the long run it affects their performance (Gautam et al., 2016). Academic disabilities, such as delays or time thieves, are very common among students (Goroshit, 2018). Students procrastinate in making assignments given by lecturers that need to be completed. When students continue to do such things, they will lose interest in doing assignments and it will put stress on students (Kupst et al., 2015). Last but not least, exams are critical in academic factors because they determine the quality of continuous learning and teaching at the university (Mogapi, 2016). But with exams, it can also cause more stress to students than can be imagined due to the pre-determined exam period. And students are also stressed because they have to prove that they deserve better grades in exams. This thinking makes them confused, which in the long run puts pressure on them (Leonard et al., 2015).

Research Hypothesis

The hypothesis for this research is to see if there are any significant different between the independent variable and dependent variable:

H1   There is a significant relationship between environment factor and stress among wellness student year 2 Universiti Malaysia Kelantan, Kampus Kota

H2   There is a significant relationship between personal factors and stress among wellness student year 2 Universiti Malaysia Kelantan, Kampus Kota

H3   There is a significant relationship between academic factors and stress among wellness student year 2 Universiti Malaysia Kelantan, Kampus Kota

Research Framework

The Figure 1 below shows the research framework for this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

This study used the quantitative method that gather all data through questionnaires. In this research, the researcher identified the determinant factors that influence the increasing of stress among wellness student year 2 in Universiti Malaysia Kelantan, Kampus Kota. Therefore, descriptive research was used to gain data through questionnaire that was be collected from respondent. The questionnaire consisted 40 items and divided into 5 sections. The first section is the demographic profile such as gender, age, marital status and religion. The second, third, fourth, and fifth section inclusive 32 items with five-point Likert-scale ranging from 1=strongly disagree till 5=strongly agree. The question was adopted from previous studies by (Arip et, al 2015).

Data Collection

The data collection process took 14 days to complete. In the first stage, this study involved primary data collection using questionnaire using Google Form, which were distributed to 118 respondent who participated in this study. The respondent was also selected to answer the questions related to the awareness of factors that influence the increasing of stress among wellness student year 2 in Universiti Malaysia Kelantan Kampus Kota.

Sampling

The sampling method used in this study was the simple random. This sampling method is the simplest form and can be carried out without any biasness (Fithian et al, 2015). The purpose of simple random sampling is to select the individual sample as the representative of the population. In achieving reliable and valid sample of this study, the researcher used the equation from Krejcie & Morgan (1970).

$$S = \frac{x^2 N_p (1-P)}{e^2 (N-1) + x^2 p (1-p)}$$

135

n= sample size
N= population size
e= the degree of accuracy expressed as proportion (0.05)
x^2 = chi-square of degree of freedom 1 and confidence 95% (3.481)
p = proportion of population (if unknown, 0.5)

Data Analysis

The tool used in analysing the data is IBM SPSS statistic 25.0 software. IBM SPSS assists researchers in determining the best statistical techniques to use. SPSS data will be interpreted into statistics such as valid percentages and cumulative percentages. The researcher will use this to analyses the data for descriptive purposes, descriptive analysis using percentages, numbers, means and standard deviations. While to determine relationship between independent and dependent variables, bivariate analysis using Pearson correlation has been performed.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research

Table 1: Frequency Analysis

Characteristics	Frequency (N)	Percentage (%)
Gander		
Male	81	32.8
Female	168	67.2
Age		
18-21 years	33	28
22-25 years	85	72
Marital Status		
Single	118	100
Religion		
Muslim	95	80.5
Christian	13	11
Buddha	10	8
Race		
Malay	92	78
Chinese	17	14.4
Indian	19	7.6
Educational Level		
degree	118	100
Income		
Below rm 1000	106	89.8
Rm 1000-rm 2000	12	10.2

Table 1 depicts the frequency analysis of the respondents. Out of 118 respondents, the majority of the respondents are females, which accounted for 168 (67.2%) of the total sample. Next, in terms of religion, revealed that most respondents are Muslim with 95 (80.5%), followed by

136

Christian 13(11%) and Buddha 10 (8%). Meanwhile, in terms of race, the majority are Malay with 92 (78%), followed by Chinese with 17(14.4%), and Indian with 9 (7.6 %). In terms of respondent age, 33 (28%) of them are 18 to 21 years old and (85) 72% are 22 to 25 years old. As for the educational level, of 118 respondents, 100% are degrees. The statistic nearly represents the actual demographic respondent with regard to the influencing the increasing stress among wellness students in year 2 Universiti Malaysia Kelantan, Kampus Kota.

Result of Descriptive Analysis

Table 2 below show the result of descriptive analysis of this research.

Table 17:Descriptive Analysis

Variable	Items	Mean score (M)	Standard deviation (SD)
Environmental Factors	The noisy environment at home makes me unable to concentrate during learning sessions.	4.00	0.730
	I'm not comfortable with the learning environment at home.	3.91	0.734
	I'm not ready to study online classes.	3.92	0.752
	I have a facilities problem to attend online classes.	3.90	0.740
	Internet access in my home area is a bit unsatisfied.	3.90	0.74
	I feel stressed if I can't use the internet as long as I want.	3.92	0.730
	I feel stressed in dividing time to study and time with family.	3.90	0.710
	I feel stressed with the bad living conditions in my home.	3.90	0.720
Personal Factors	My families are not supportive.	3.88	0.693
	Financial problem in the family makes me stresses.	4.00	0.700
	I find it difficult to get along with group members in completing assignments.	4.00	0.670
	I have poor communication skills when dealing with lecturers and other colleagues.	3.93	0.680
	Lack of time to rest makes me stressed.	3.90	0.650
	I feel stresses when I have problem with my friends.	3.84	0.680
	I feel nervous delivering the class presentation.	3.90	0.644
	I feel guilty if I fail to fulfill my parent's hope.	3.94	0.631
Academic Factors	I feel stressed when I can't complete the assignments given by the lecturer.	3.92	0.752
	I will be stressed when having a lot of assignments.	4.00	0.600
	I feel stressed dealing with difficult subjects.	3.92	0.681

	I will be stressed when I do not understand what the lecturer is presenting during the learning session.	3.91	0.634
	I feel my lecturer are not supportive.	3.93	0.663
	I feel stressed because the delivery deadline is getting closer.	4.00	0.707
	The material provided for online classes is less effective.	4.00	0.720
	I feel stressed if I don't achieve excellent results.	3.92	0.642
Stress	Social isolation during this period of the Covid-19 pandemic make me stress.	3.87	0.770
	I can't control my feelings of stress.	4.00	0.722
	I get stressed when I go to online classes.	3.90	0.740
	I feel it is hard to concentrate on whatever things I do every day.	4.00	0.760
	Personal problems always cause me stress.	3.88	0.733
	I feel stressed with online learning because there aren't enough hours in a day to do all the things I must do.	4.00	0.744
	I feel stressed with online learning because I find that I don't have time for many interests and hobbies outside of work.	3.94	0.754
	I feel stressed for doing things I didn't want to and almost gave up.	3.94	0.771

Table 2 portrays the mean and standard deviation for twenty-four statements under three independent variables and eight statements under the dependent variable based on the survey involving 118 respondents. The highest mean value for environmental factors was obtained by Question 1 with 4.00, where the respondents agreed that a noisy environment at home makes students unable to concentrate during learning sessions. The lowest mean value belongs to Question 7 with 3.90, where the respondents agree that students feel stressed in dividing the time study and time with family. As the personal factor, the highest value of mean was obtained by Question 2 with 4.00, where the respondents agreed that financial problems in the family make students stressed. The lowest mean value belongs to Question 6 with 3.84, where the respondents agreed that students feel stressed when having a problem with their friends. The highest mean value for academic factors was obtained by Question 7 with 4.00, where the respondents agreed that the material provided for online classes is less effective. The lowest mean value belongs to Question 4 with 3.91, where respondents agreed that students will be stressed when they do not understand what the lecture is presenting during the learning session. Next, the highest mean value for the dependent variable of stress was obtained by Question 6 with 4.00, where the respondents agree that students feel stressed with online learning because there aren't enough hours in a day to do all the things that they must do. The lowest mean value belongs to Question 3 with 3.90, where the respondents agreed that students get stressed when they go to online classes.

Result of Reliability Analysis

Table 3 shows the result of reliability analysis of this research.

Table 18: Reliability Analysis

Variable	Number of items	Cronbach's Alpha
Stress	8	0.903
Environmental Factors	8	0.881
Personal Factors	8	0.812
Academic Factors	8	0.820

Table 3 shows the reliability analysis for the dependent variable which is stress has a high Cronbach's Alpha value which is 0.903 with 8 questions. Next, the first independent variable is the environmental factor with Cronbach's Alpha value is 0.881 with 8 questions. Moreover, the second independent variable is with 8 questions and Cronbach's Alpha value of 0.812. Lastly, an independent variable with 8 questions and Cronbach's Alpha value was 0.820.

Result of Pearson Correlation Analysis

Table 4 below shows the result of correlation analysis of this research.

Table 19: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: There is a significant relationship between the environmental factors and stress among wellness student year 2 in Universiti Malaysia Kelantan, Kampus Kota	< 0.001	H1 supported
H2: There is a significant relationship between the personal factors and stress among wellness student year 2 in Universiti Malaysia Kelantan, Kampus Kota.	< 0.001	H2 supported
H3: There is a significant relationship between the academic factors and stress among wellness student year 2 in Universiti Malaysia Kelantan, Kampus Kota	< 0.001	H3 supported

Based on table 4, the p-value for hypothesis 1 is 0.001 which is below 0.05, and when p is less than 0.05, this means we reject the null hypothesis and accept the alternative hypothesis. The significant relationship between environmental factors and stress is strong. Hypothesis 2 is 0.001 which is below 0.05, and when p is less than 0.05, this means we reject the null hypothesis and accept the alternative hypothesis. The significant relationship between personal factors and stress is strong. Hypothesis 3 is 0.001 which is below 0.05, and when p is less than 0.05, this means we reject the null hypothesis and accept the alternative hypothesis. The significant relationship between academic factors and stress is strong.

DISCUSSION AND RECOMMENDATION

Discussions are aimed at solving the questions and addressing the hypotheses as mentioned in the first chapter of this study. In general, this study has extensively researched factors that influence the increase of stress among wellness students in year 2 in Universiti Malaysia Kelantan, Kampus Kota. Based on the findings of the study, the current study would provide several recommendations for factors that influence the stress of student wellness and future researchers that allows the faculty of universities establishment their responsibilities toward student wellness and express concern regarding the improvement that can be made in future studies. The faculty of universities should raise the sample size and test the research approach more widely to acquire a better understanding of factors of stress among students that study at university. Utilized the scale that can validate in a bigger sample size studies in the future for long-term studies to analyze the factors that influence the increase of stress among student wellness year 2 in Universiti Malaysia Kelantan, Kampus Kota. Using a multi-language capability to assist the students of various races that speak a different language in understanding while in learning sessions and to increase the reliability and effectiveness of the outcome of student

The research findings are too fundamental for future research continuation. hence, it is prescribed that future inquiries about the components that impact the push of understudies incorporate more statistical characteristics of the respondents such as occupation and numerous more in arrange to produce the distinctive comes about or discoveries from different points of view.

Furthermore, it is recommended that future researchers improvise the data collection of this study, especially in terms of questionnaire distribution of respondents rather than distributing the questionnaire through the internet or web, the future researchers can engage in something like face-to-face questionnaire distribution. As a result, the researchers can clarify the research purpose in detail while distributing the questionnaire to the potential respondents. Additionally, the extent of interaction between the researchers and the respondents can also be helpful in order to enlighten the respondents more clearly about what will be asked in the questionnaires.

CONCLUSION

In conclusion, this study has been accomplished to discover the factors that influence the increasing of stress among wellness student's year 2 in Universiti Malaysia Kelantan, Kampus Kota. Three independent variables, which are environmental factors, personal factors, and academic factors have been chosen to examine their relationship with the dependent variable, which is the stress among wellness students in year 2 in Universiti Malaysia Kelantan, Kampus Kota. A total of 118 respondents from the age of 18 years old and above were selected from all student wellness year 2 to examine their factors of stress. Overall, based on Pearson correlations analysis, the environmental factors scored a value of 0.856. followed by a personal factor with 0.846, and an academic factor with 0.898.

ABSTRACT

The mental health issue among urban workers is an issue that often receives attention due to the increase in the number of cases, especially during the implementation period of the Movement Control Order (MCO) due to the increasing Covid-19 epidemic. The problem statement that has been detected in the occurrence of mental problems among urban workers is due to 3 main factors, namely unbalanced lifestyle, income crisis, and time management. These causes have indirectly contributed to the increase cases of mental health problems among urban workers in the study area of Kelantan and Selangor. The research objective of this study is to identify the effects of an unbalanced lifestyle, income crisis, and time management on the mental health of urban workers. This study uses a quantitative research method to obtain responses and information by using the questionnaire method. Questionnaires were distributed online to respondents around Kelantan and Selangor. In this study, the Pearson correlation method was used, and aimed at obtaining the required data analysis. The coefficients were used to identify between independent variable and dependent variable of mental health issues among urban workers. Statistical Package for the Social Sciences (SPSS) is a software suite that is widely used in finding information data.

Keywords: Mental Health, Unbalanced Lifestyle, Income Crisis, Time Management, Movement Control Order (MCO)

INTRODUCTION

This study examined the effect of unbalanced lifestyle on mental health experienced by workers who live in the city, especially those who are in the area of Selangor and Kelantan. This unbalance lifestyle can exist because life in the city requires a lot of money compared to those who live in rural areas because the cost of those who are in the city is quite expensive, Globalization & Health (2018). Next is the effect of the income crisis on mental health among urban workers. Unbalanced lifestyle is very closely related to income crisis because when the value of a financial institution or real estate declines rapidly, a financial crisis arises. Besides that, the effect of time management on mental health is also closely related as according to Claessens et al. (2007) these definitions have been summarized by defining time management as behaviours that aim at achieving effective use of time while performing certain goal-directed activities.

Significance of the study

This study is closely related to the ministries involved in this problem, namely Ministry of Health (MOH). In its point of view, this research can gain a significant benefit because it shows the importance of taking care of the well-being of mental health among urban workers. So, from this study, it can influence the sensitivity of the ministry to organize or establish a health care centre, to help in minimizing this mental health disease among the urban workers. The Ministry of Human Resources is the authority to ensure the development of skills, occupational

and workers safety, and health. So, it is crucial for them to acknowledge the cause of mental health among the urban workers because they can formulate an appropriate programme to overcome these problems. Societies that can relate to this study are the workers in urban areas. Essentially, a pandemic situation will lead to a huge negative impact on urban workers, where it raises their stress level and as a result, they might face mental health diseases. So, this study provides an education about mental health and how the workers can overcome the issue.

LITERATURE REVIEW

Unbalanced Lifestyle

Lifestyle is a crucial factor that must be controlled in daily life. Living in urban areas is the main factor in the existence of an unbalanced lifestyle due to the various challenges in life. This can be proven through a study from Globalization & Health (2018) that shows living in urban areas is the main factor in the existence of an unbalanced lifestyle due to the various challenges of life that must be faced compared to life in rural areas. Every worker, especially in urban areas, needs to practice an active and healthy lifestyle during the Covid-19 season to avoid the existence of unbalanced lifestyle that can lead to mental health diseases. Experiencing unbalanced lifestyle will only bring a negative impact and it is difficult to control due to the emergence of Covid-19 that is plaguing the entire country.

According to Nabi et al. (2008) and Surtees et al. (2008), there is a strong link between mental health and physical activities. This shows that there is a strong relationship that proves an unbalanced lifestyle greatly influences an individual's mental state towards negative behaviours. Based on Brian Adam (2017), one of the key factors that resulting in mental health issues is having an unbalanced lifestyle. An unbalanced lifestyle does not only provide physical but also mental effects. This is because a number of physical activities really affect mental health like how they affect the body. In fact, the article by Scott Douglas. (2018) shows that there are some studies that demonstrate that physical activities are as effective as taking antidepressants. Having a mental issue can affect everyday life such as the ability to enjoy life, adeptness to balance diverse aspects of life, capability to develop and find strengths and weaknesses, and flexibility to express various emotions to recover from challenging times. The working environment is highly possible to affect mental health either positively or negatively. This can be seen that the challenging work environment in the city greatly influences mental problems among urban workers during the Covid-19 outbreak.

Income Crisis

According to Bahavana (2021), a financial crisis means a loss of wealth but does not necessarily lead to significant changes to the economy. When the value of a financial institution or real estate declines rapidly, a financial crisis arises (Bahavana, 2021). The relationship between income crisis and mental health among the urban population is related. This is because according to the study if there is an economic crisis it will increase the number of suicide deaths (WHO, 2007). This happens when there is an economic crisis that makes many people affected as many will lose their jobs and create depression when they think too much about finding new jobs and mental health will also be affected due to a lack of family support for the victims. (WHO, 2007).

While according to Marazzitii (2020) the economic factors can affect mental well-being, it is not surprising that poor mental health improvement is observed in different countries, existing studies show that consequences of economic crises, such as unemployment, increased workloads, or work restructuring, and reductions in staffing and salaries, may be important stressing factors with negative effects on mental health.

Time Management

According to Claessens et al. (2007) these definitions have been summarized by defining time management as behaviours that aim at achieving effective use of time while performing certain goal-directed activities. Definition of time does not focus on time itself but on how accomplished within a time frame. He also states that skills of time management can cause anxiety and distress to mental health because of workload and exposure to covid-19 problems. While, W. Rossler (2012) found out that those who struggle with time management are more likely to experience stress, sleep issues, anxiety, depression, and other mental health issues. They may also start to exhibit symptoms of workplace burnout. As the industrial world has transformed toward a service economy, a particular interest has developed in mental health problems at the workplace.

Thus, Philip G. Levendusky (2021) studies that time management is not only crucial to getting things done on time for your job. Timely mental health care and mental healthcare training need to be developed and implemented as part of professional development activities. As we know during the Covid 19 many people lost their jobs and at the same time, they needed money to survive. Because some people need to work overtime to support their families during the Covid 19. According to the Epidemiological studying, it has shown that working for a long duration will lead to negative effects like illness of cardiovascular diseases, stress, depressive state, anxiety, sleep quality, all-cause mortality, hypertension, and health behaviours, Mariam (2019),. The Covid-19 pandemic has heavily burdened healthcare systems throughout the world. Mental health problems, followed by female gender, and worry about infection or about infecting others. Social support correlated with fewer mental health problems.

Mental Health

Essentially, World Health Organization (WHO), defines mental health as: "… a state of well-being in which the individual realizes his or her own abilities, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his or her community." (WHO, 2001).But the most famous and used definition of mental health by WHO is:"… a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." (WHO, 2001).

These characteristics of mental health definition are crucial to improving and boosting human well-being. Mental health will always integrate and has a deep connection with human physical health as well as its behaviour. Nowadays, human mental health can be influenced by social interaction, biological characteristics, or psychological itself. Just as the health and disease generally. Moreover, mental health diseases show the rapidly increasing data flow after the pandemic situation, Covid-19. This is because the pandemic situation led the government to impose the movement control orders (MCO). This situation caused many countries, including Malaysia, to shut down their community movements. People need to deal with a stressful life, where they are not able go out to fulfil their jobs or even do business. The situation keeps going for several years; thus, it affects the communities. In addition, there are people and families who have lost their income to continue their daily life, especially in urban areas.

Thus, this situation has caused more factors and issues that can affect mental health among the urban workers during the movement control orders (MCO). Therefore, this study will investigate some of the factors that affect mental health among urban workers. Among the factors are an unbalanced lifestyle, income crisis, and time management. According to J. H. Fowler & Christakis, 2008; Jetten, Haslam, Haslam, & Branscombe, 2009, a positive relationship between an individual's mental health can help to boost happiness, and wisdom as well life qualities. So, to overcome the lifestyle problems, both physically and mentally healthy

is the central part that urban workers need to take care of. Most previous studies showed that during the pandemic situation, parents are negatively affected which include their stress, depression and anxiety (Gromada et al., 2020). This is because, the changing situation has influenced the mental states of urban workers, especially parents, as they need to ensure that they can control the issues and how life is going for their children or family.

Research Hypothesis

The literature review shows the relationship between independent variables and dependent variables. Independent variables consist of unbalanced lifestyles, income crisis, and time management are the factors that cause the dependent variable, mental health happened. The hypothesis of the study has been summarized in the following manner:

H1: There is a significant relationship between an unbalanced lifestyle and mental health among workers in urban areas.
H2: There is a significant relationship between income crisis and mental health among workers in urban areas.
H3: There is a significant relationship between time management and mental health among workers in urban areas.

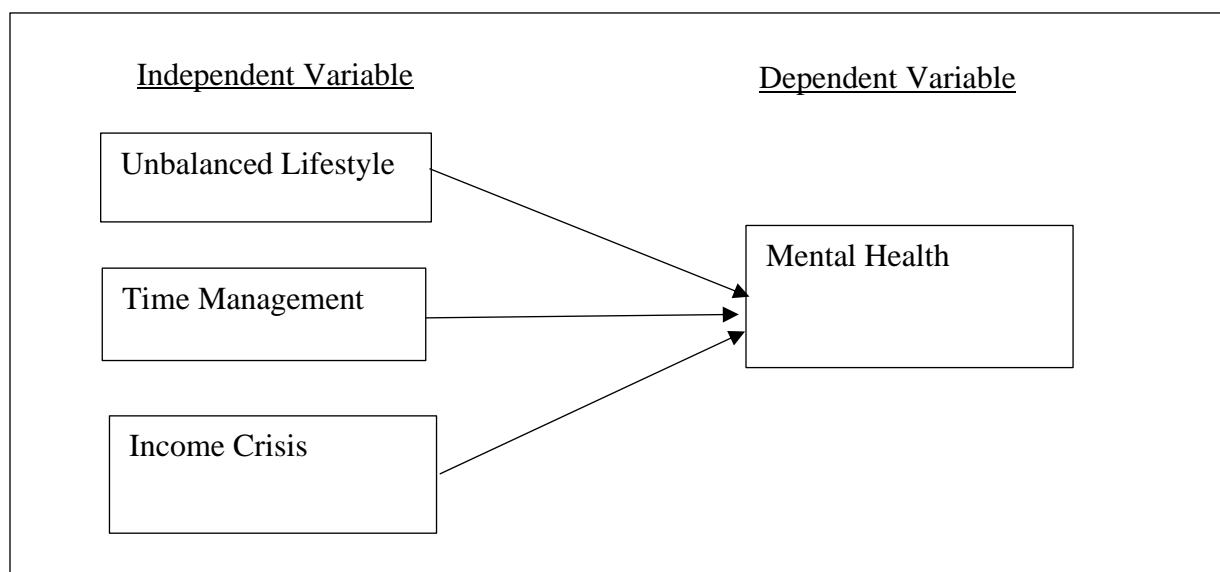
Research Framework


Figure 1 below shows the research framework

Figure 1: Research Framework

METHODOLOGY

Research Design

The quantitative method was used in this study, with questionnaires distributed to 202 people living in two urban areas. The population chosen for this study was Malaysians living in the urban areas of Selangor and Kelantan. These are the areas that the workers were affected by the mental health issues during movement control orders (MCO).

Besides that, a set of questionnaires was distributed to the population of the workers who live in urban areas in Kelantan and Selangor to collect the data. The researcher has divided the questionnaires into 3 sections which are sections A, B, and C. Part A involves questions

regarding the respondent demographic segmentation with six questions to answer. In this part, the questions are based on the characteristics of the population for example: age, area, what is the employment status, how many children, and what is the spouse's employment status. Meanwhile, Part B discusses the variables used in this study. It focuses on the independent variable such as the stage of mental health of the worker is. The last part, which is Part C contains the dependent variables which are unbalanced lifestyle, income crisis and time management that the workers faced during the Covid 19 in the urban areas like Selangor and Kelantan.

Data Collection

The data collection was conducted using Google Form questionnaire to reach the respondents to answer all the questions. Using social media like Instagram, Telegram and WhatsApp made it easier to reach the respondents, for example sharing the link of Google Form for respondents from Selangor and Kelantan. The reason why researchers used the Google Form is, it can save money and time in answering the questionnaires to collect information easily and efficiently.

Sampling

In this study, the probability sampling technique was chosen as it could be a simple sampling technique. Probability sampling could be a sampling technique during which the researcher chooses samples from a bigger population employing a method. The data from respondents were collected using questionnaires using Google Form which was shared over social media platforms such as WhatsApp and Telegram. By doing this technique it can save cost and time for not needing to meet the person face to face during the pandemic.

Data Analysis

We used several techniques to gather all the information we need to give a stronger explanation of the mental health issues among urban area workers during (MCO). There are four parts that we used for the analysis of this data among them is Pearson correlation. The coefficients used are intended to identify between dependent variables and the independent variables. Mental health of workers in urban areas due to Covid 19 are affected by an unbalanced lifestyle, income crisis and time management. Besides that, we also used SPSS to analyse the data.

FINDINGS

Results of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Frequency Analysis

Demographic Profile	Number of Respondents	Percentages (%)
Gender		
Male	83	41.1
Female	119	58.9
Age		
18-30 years old	124	61.4
31-45 years old	67	33.2
45+ years old	11	5.4
Your Employment Status		
Unemployed	48	23.8

Government Worker	63	31.2
Private Worker	51	25.2
Self-employed	40	19.8
Your Spouse's Employment Status		
Unemployed	64	31.7
Government Worker	48	23.8
Private Worker	33	16.3
Where Do You Live		
Urban Areas in Kelantan	110	45.5
Urban Areas in Selangor	92	54.5
How Many Children Do You Have		
None	79	39.1

This table above shows the data for the demographic profiles of the respondents such as gender, age, employment status, spouse's employment status, where they live, and how many children they have, roughly describing the profiles of the research study samples studied.

Results of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Unbalanced Lifestyle	Often neglect a healthy lifestyle and do not practice exercise activities	3.12	1.154
	Lack of awareness of the importance of a balanced lifestyle to mental health care	3.00	1.261
	Not maintaining good sleep quality	3.30	1.161
	Practicing unhealthy eating habits on a regular basis	3.27	1.098
	Often exposed to unhealthy environments such as dirty and noisy environments	3.05	1.230
Income Crisis	Income affected during Covid 19	3.35	1.258
	Expenses affected during covid 19	3.39	1.261
	Lifestyle experienced changes after the onset of Covid 19	3.69	1.080
	Feel worried about your current financial situation	3.52	1.185
	Financial level deteriorating in the situation persists	3.43	1.179
Time Management	Have more than one job	2.77	1.365
	Lack time with family	3.31	1.232
	Have a schedule to make it easier to do the work	3.55	1.045
	Lack of rest on weekends	3.36	1.169
	Work overload at the office	3.09	1.318

Table 2 shows the value of mean score and standard deviation in independent variables (Unbalanced Lifestyle, Income Crisis, and Time Management) and dependent variable (Mental Health). The results are examined using SPSS software and a five-point Likert scale to measure all the questions in section C, D, E which are independent variables, and section B which is represented as a dependent variable.

Results of Reliability Analysis

The Table 3 below shows the reliability analysis of this research.

Table 3: Reliability Analysis

Variables	Items	Cronbach Alpha
Unbalanced Lifestyle	5	0.590
Income Crisis	5	0.902
Time Management	5	0.952
Mental Health	5	0.834

From the table above, the Cronbach Alpha for unbalanced lifestyle is 0.590, 09.02 for income crisis, 0.952 for time management and 0.843 for mental health. All items in the adopted variables are reliable for the research.

Result of Pearson Correlation Analysis

Table 4 below shows the correlation analysis of this research.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: There is a significant relationship between an unbalanced lifestyle and mental health among workers in urban areas.	0.323	H1 is supported
H2: There is a significant relationship between income crisis and mental health among workers in urban areas.	0.400	H2 is supported
H3: There is a significant relationship between time management and mental health among workers in urban areas.	0.397	H3 is supported

DISCUSSION & RECOMMENDATIONS

As mentioned in the first chapter, the discussion in this study was aimed at answering questions and addressing hypotheses. This study has extensively researched the mental health issues among urban area workers during movement control orders (MCO), especially those living in Selangor and Kelantan. Mental health is important to every stage of life which is childhood, teenagers, adults, and others. Since the Covid 19 pandemic, many workers have had some problems with their life such as unbalanced lifestyles, income crises, and time management. These problems affect their mental health in their daily life as human beings to make the right decision for themself or their family. The workers in urban areas such as Kelantan and Selangor need stable finance to support their families. Therefore, some of them have a part-time job every day such as being riders for Grab, Food Panda and others to add to the income during

Covid 19. When they have a part-time job there is less rest, and less time with family which will cause stress, depression, and anxiety.

A healthy and balanced lifestyle is important for workers in urban areas to maintain good mental health. The workers must manage their daily routines such as having a good rest, eating good food, exercising on weekends twice per week, or having some activities with family or friends. Unmanaged lifestyle will not only affect mental health but will affect the physical human body such as easy to get sick. For the income crisis, the result of the questionnaire we conducted for the public was that most of our respondents had spouses who did not work and those who experienced the income crisis were those who lived in the large urban area, namely Selangor. These income crises will cause them to also experience time management problems and the effects of this make them always neglect a healthy lifestyle. They also have problems with poor sleep quality as a result of those problems. They have to work hard to support their livelihoods in the city. They do not practice a healthy lifestyle and they are also affected by their income because during this pandemic it is quite difficult for the spouse to get a job to help the breadwinner to cover daily expenses. If income is already affected of course their expenses are also affected as life for a person will change during pandemic as most of those who are in the city will mostly lose their jobs as a consequence of the company they work with has suffered a lot of losses. The results of a survey conducted found as many as 31 percent said they agreed with the affected earnings.

CONCLUSION

In short, this study has been carried out to locate the Mental Health Issues Among Urban Workers During Movement Control Orders (MCO) in Selangor and Kelantan. There are three independent variables, labelled unbalanced lifestyles, income crisis, and time management. These independent variables have been selected to study their relationship with the dependent variable, the Mental Health Issues Among Urban Workers During Movement Control Orders (MCO) Selangor and Kelantan. In order to investigate the mental health issues among urban workers from the age of 18 years old and above from Kelantan and Selangor, the result has been collected from a total of 202 respondents. Generally, based on Pearson's correlation analysis, an unbalanced lifestyle factor records a value of *0.0.323, pursued by income crisis scored with *0.400, and time management execute a value of *0.397.

ABSTRACT

This research presents the study on the factors of obesity among students at University Malaysia Kelantan, City Campus. Obesity is a medical disease in which excess body fat has built up to the point where it may be harmful to one's health. However, obesity can relate to students. Therefore, this research seeks to investigate the relationship between the habits of unhealthy eating patterns that lead to obesity, the relationship between the unhealthy lifestyle that can cause obesity and the relationship between stress factors and obesity among UMK students. There are 357 respondents from UMK City Campus students to answer the survey conducted by the researcher. The data analysis was done by SPSS Software application. This study provided numerical data about the relationship between unhealthy eating, unhealthy lifestyle, stress, and obesity among UMK City Campus students. The findings show that unhealthy eating, unhealthy lifestyle, stress, and obesity have a relationship with less than 0.01 of p-value. The result shows that the relationship between unhealthy eating, unhealthy lifestyle, stress, and obesity are significant. It was found that all research objectives have been answered, and all hypotheses were accepted. A few recommendations related to the study have been proposed by the researchers.

Keywords: Obesity, Unhealthy Eating, Unhealthy Lifestyle, Stress

INTRODUCTION

Obesity is a medical condition in which a person's weight surpasses normal levels and has a negative impact on their health. They are considered "obese" if they weight more than 20% of their normal weight (Mohd Ramzdhan, 2020). Obesity among students is not new. Obesity is a threat to students. Diet and healthy lifestyle is very important. Eating habits that follow the prescribed meal requirements, as well as sticking to schedules such as breakfast, lunch, and supper, are all part of a healthy and balanced eating style (Abdullah & Ali, 2019).

There are many factors that can contribute to the problem of obesity and among the main factors are unhealthy food intake, unhealthy lifestyle, and stress. There are several other factors that can lead to obesity such as age, gender, genetics, internal diseases, and even the intake of certain medications such as steroids. This study is expected to reduce cases of obesity among students of UMK City Campus and it is hoped that this study can give awareness to students and therefore not to underestimate the issue of obesity among students of UMK City Campus. This study consists of three objectives:

1. To correlate the habits of unhealthy eating with the obesity among UMK students
2. To identify the unhealthy lifestyle that can cause the obesity among UMK students
3. To investigate the relationship between stress factors with the obesity among UMK students.

Significance of the Study

This study will broaden the scope of students' understanding about factors of obesity. Through it, researchers and students will be more concerned about health care. At the very least, they will have an awareness and enthusiasm to start controlling their obesity levels even though it is a bit late. Similarly, this study is expected to reduce cases of obesity among students of UMK City Campus and it is hoped that this study can give awareness to students so as not to underestimate the issue of obesity among students of UMK City Campus.

LITERATURE REVIEW

Obesity

Obesity is a complicated condition characterised by an excess of body fat. Obesity is more than a cosmetic issue. It is a medical condition that puts people at risk for various diseases and health problems like heart disease, diabetes, high blood pressure, and some cancers. Some people struggle to lose weight for a variety of reasons.

Obesity is usually caused by a combination of genetic, physiological, and environmental variables, as well as dietary, physical activity, and exercise decisions (Khandelwal, 2020). Obesity develops when people consume more calories than expend via typical daily activity and exercise, despite genetic, behavioural, metabolic, and hormonal impacts on body weight (Ahmed, 2018). These calories are stored as fat in the body.

Unhealthy Eating

Unhealthy eating habits are foods that can slip into habits that lead to irregular eating. Unhealthy eating consists of greasy foods, processed foods, fast foods, snacks, sugary foods, and too much caffeine. Irregular eating can take many forms, ranging from unhealthy eating habits that prevent weight loss to overeating disorders. It becomes very difficult to change.

Most university students have bad eating habits. When transitioning to university life, they are at risk of getting obese, as they are responsible for their daily diet and lifestyle (Ahmad, 2018). Environmental factors also contribute to unhealthy eating habits among university students (Addy, 2012). For example, shopping malls, self-service food machines, and fast-food outlets have caused students to be influenced and complacent in adopting healthy eating habits (Bernard AL, 2007).

Unhealthy Lifestyle

Current trends show that most dangerous diseases occur because of unhealthy lifestyle practices. However, many students practice unhealthy lifestyles in their own lives. Obesity is also caused by laziness and a refusal to exercise; when students over-indulge their bodies by not exercising, fat will continue to be stored in the body (Zhel, 2020). Eventually, the small body becomes plump, chubby and fat.

Moreover, the problem of obesity occurs due to unhealthy lifestyles such as not taking care of daily nutrition (Moores, 2020). Obesity can be caused by eating foods that are heavy in fat and overly sugary (Zain, 2020). Cooking techniques like frying can also contribute to fat accumulation in the body. The effect of increasing obesity among students is also due to changes in eating patterns nowadays. Therefore, students find it difficult to adopt a healthy lifestyle because they are surrounded by good food and drink. Today, Malaysia is known to be rich in a variety of delicious dishes ranging from breakfast, lunch, to dinner. This is coupled with various festivals to make Malaysia a food festival. This causes students to be more quickly attracted to tasty foods and drinks due to viral trends as well as their appetite cravings. The

154

students ate whatever was in front of them without thinking about the consequences. It is like a culture when every meal is filled with heavy foods high in fats and carbohydrates.

Stress

Stress may not impact everyone in the same way, but it can cause sickness and poor experiences. As a result, stress management is a critical component that influences whether and how individuals seek medical care and social assistance, as well as how they trust expert advice (Passer & Smith, 2007). According to McKean et al. (2000), undergraduate students experience increased stress at regular intervals during the semester due to academic duties, financial pressures, and lack of time management skills. When stress is seen negatively or becomes overpowering, it can affect one's health, emotional well-being, and academic achievement. As a result, learning suitable stress management techniques is crucial for undergraduate students.

Research Hypothesis

The literature review highlighted that the independent variables such as unhealthy eating, unhealthy lifestyle, stress, and obesity among students UMK. The hypotheses of the research are:

H1:   There is a significant relationship between unhealthy eating habits and obesity among UMK students
H2:   There is a significant relationship between an unhealthy lifestyle and obesity among UMK students
H3:   There is a significant relationship between stress factors and obesity among UMK students

Research Framework

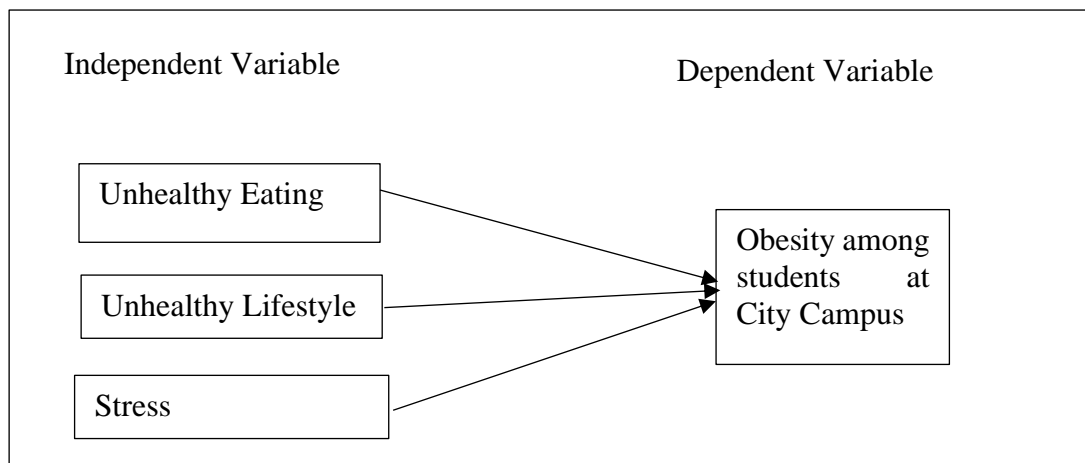
Figure 1 below shows the research framework of this research.


Figure 1: Research Framework

Figure 1 shows the independent variables (IV) and the dependent variables (DV) in this research. Independent variables are factors that can adversely affect obesity among UMK students. There are three independent variables which are unhealthy eating, unhealthy lifestyle and stress. Each independent variable (IV) affects the dependent variable which is obesity (DV).

METHODOLOGY

Research Design

The goal of the research design is to ensure that the information gathered allows the researchers to successfully focus on the research problem. This study used a quantitative method through the use of large-scale survey research to collect information by distributing a set of questionnaires through Google Form.

Data Collection

In the first stage, this study involved primary data collection using questionnaires using Google Form, which were distributed to 357 respondents who participated in this study. The respondents were also selected randomly to answer the questions related to the awareness of factors that cause obesity among students in University Malaysia Kelantan.

Sampling

In this study, the probability sampling technique was chosen because of the simple sampling method. Probability sampling is a sampling technique which the researcher chooses samples from a bigger population employing a method. The data from respondents were collected using questionnaires through Google Form and shared over social media platforms such as Whatsapp and Telegram. By doing this technique, it can save cost and time for not needing to meet the person face to face during the pandemic.

Data Analysis

The researcher utilized the Statistical Package for the Social Science (SPSS), which is a popular statistical analysis software program. There were four types of data analysis used in this study, that were frequency analysis, descriptive analysis, reliability analysis, and Pearson's Correlation analysis.

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of frequency analysis of this research.

Table 1: Frequency Analysis (n=357)

Characteristics	Frequency	Percentage
Gender		
Male	197	55.2
Female	160	44.8
Age		
19 – 21 years old	23	6.4
22 – 24 years old	298	83.5
25 years and above	36	10.1
Race		
Malay	273	43.0
Chinese	44	29.9
Indian	37	25.7
Other	5	1.4
Year of Studies		
1	17	4.8

2	68	19.0
3	163	45.7
4	101	28.3
5	8	2.2

Frequency analysis was used to summarise the background facts of the demographic profiles of 357 respondents in Table 1. There are two gender groups namely male and female. There were 197 (55.2%) respondents who represented male and 160 (44.8%) respondents who represented female. It shows the number of male respondents is higher compared with female respondents in this research. In addition, age is divided into 3 categories. There were 23 (6.4%) respondents between 19 - 21 years old. While the majority of respondents are between 22 - 24 years old, comprises of 298 (83.5%) respondents. Lastly, only 36 (10.1%) respondents were reported at the age of 25 years and above. Next, race is divided into 4 categories. The majority respondents are Malay which is 273 (76.5%) followed by Chinese, 44 (12.3%) respondents. There are also Indian with 37 (10.4%) respondents and other races namely Sabahan, represented by 3 (1.4%) respondents. Lastly, years of studies is divided into 5 categories. Year 1 with 17 (4.8%) and year 2 with 68 (19.0%). The majority respondents are year 3 which is 163 (45.7%) followed by year 4 with 101 (28.3%) respondents. There is also year 5 with 8 (2.2%) respondents

Result of Descriptive Analysis

Table 2 below shows the result of descriptive analysis of this research.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Unhealthy Eating	Do you know what unhealthy eating is?	1.26	0.440
	How often do you eat fast-food?	2.68	0.727
	Do you prioritize a balanced diet every meal?	2.79	0.446
	Do you agree excessive food intake will contribute to dangerous diseases?	2.91	0.296
	Do students consume less healthy food such as vegetables and fruits because they believe fast food is easier to find?	2.91	0.292
	Do you consume fried food regularly?	2.80	0.450
Lifestyle	Do you like to do physical activities?	2.82	0.443
	In a week, I exercise very often.	2.73	0.516

	Does exercising cure obesity?	2.88	0.343
	Do you have a schedule for exercising?	2.70	0.579
	Are you aware of the importance of a balanced lifestyle to the health of obesity?	2.92	0.278
	Do you agree that unhealthy lifestyle can contribute to obesity?	2.94	0.241
Stress	Have you been able to manage your recent stress levels?	2.79	0.474
	Do you do physical activity when you are stressed?	2.72	0.516
	Uncontrolled stress changes eating behaviour?	2.83	0.401
	Do you eat a lot of food to reduce stress?	2.79	0.476
	Do you consume foods every day to relieve stress?	2.79	0.482
	Do you agree that stress can contribute to obesity?	2.88	0.351

Table 2 shows the mean and standard deviation for 18 statements under three independent variables based on the survey involving 357 respondents. The mean and standard deviation analysis for independent variable which is unhealthy eating. The higher mean value is item 4 and 5 whereby respondents agree with "Do you agree excessive food intake will contribute to dangerous diseases?" and "Do students consume less healthy foods such as vegetables and fruit because they believe fast food is easier to find". Followed by the question of "Do you consume fried food regularly?" which is 6 items with the mean 2.80. Next, question in item 3 which is "Do you prioritize a balanced diet every meal?" with the mean value is 2.79. Furthermore, the mean value for the item 2 in our research is 2.68 for the question "How often do you eat fast-food?". Lastly, the lowest mean value is 1.26 for the question "Do you know what unhealthy eating?" in item 1. From the data set of 357 respondents with the standard deviation, most of the values which are lower than 1 indicate that the values are close to mean. On the other hand, as for the independent variable which is unhealthy lifestyle, item 6 scores the highest mean value, which is 2.94, where the respondents agree that "Do you agree that unhealthy lifestyle can contribute to obesity" being a factor of unhealthy lifestyle. After that, the second higher mean value is item 5 which is "Are you aware of the importance of a balanced lifestyle to the health of obesity" with mean value is 2.92. Followed by question of "Does exercising cure obesity?" which is item 3 with the mean value is 2.88. Next, with the mean

value is 2.82 in item 1 which is "Do you like to do physical activities?". Furthermore, the mean value for the item 2 "In a week, I exercised very often" is 2.73. Lastly, the lowest mean value is item 4 "Do you have schedule for exercising" which is 2.70. The next independent variable is stress. Based on the table, the higher mean value is item 6 which is 2.88 with the respondents agree that "Do you agree that stress can contribute to obesity?". The second mean value is 2.83 for item 3 which is "Uncontrolled stress changes eating behaviour?". On the other hand, item 1, 4 and 5 which are "Have you been able to manage your recent stress levels?", "Do you eat a lot of food to reduce stress?" and "Do you consume foods every day to relieve stress?" shared the same mean value of 2.79. Lastly, the lowest mean value is 2.72 for item 2, "Do you do physical activity when you are stressed?". From the data set of 357 respondents with the standard deviation, most of the values which are lower than 1 indicate that the values are close to mean.

Result of Reliability Analysis

Table 3 below shows the result of reliability analysis of this research.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Unhealthy Eating	6	0.597
Lifestyle	6	0.811
Stress	6	0.891
Obesity	6	0.394

Table 3 shows the result of a reliability analysis of three independent variables and one dependent variable. The first independent variable which is unhealthy eating appears to be reliable (6 items: $\alpha = 0.597$). The second independent variable which is lifestyle shows good reliability (6 items: $\alpha = 0.811$). The third independent variable which is stress shows good reliability (6 items; $\alpha = 0.819$) and the dependent variable which is obesity demonstrates good reliability (6 items; $\alpha = 0.394$). As a result, the data is considered appropriate for further analysis.

Result of Pearson Correlation Analysis

Table 4 below shows the result of correlation analysis of this research.

<div align="center">Table 4: Pearson Correlation Analysis</div>

Hypothesis	P-Value	Result (Supported / Not Supported
H1: A positive relationship between unhealthy eating and obesity among students in UMK City Campus	0.338	H1 is supported
H2: A positive relationship between unhealthy lifestyle and obesity among students in UMK City Campus	0.249	H2 is supported
H3: A positive relationship between stress and obesity among students in UMK City Campus	0.224	H3 is supported

According to table 4 above, there is a positive relationship between unhealthy eating and obesity among students at UMK City Campus because the p-value is 0.338. Therefore, H1 supported. Second, there is a positive relationship between unhealthy lifestyle and obesity among students at UMK City Campus because the p value is 0.249. Therefore, H2 is supported. Third, there is a positive relationship between stress and obesity among students at UMK City Campus because the p value is 0.224. Therefore, H3 is supported.

DISCUSSION AND RECOMMENDATIONS

This research extensively examines factors that cause obesity among students at Universiti Malaysia Kelantan, City Campus. Based on the findings of the study, future recommendations have been made for better future research.

This study only discusses some of the factors that cause obesity among students at University Malaysia Kelantan, City Campus. The results of the analysis of the study shows the number of obesity factors among students at University Malaysia Kelantan City Campus. For recommendations, future studies can use other variables that can address current problems in reducing the number of obese students at University Malaysia Kelantan or the physical fitness status among its students. Future studies could extend the scope of the study to involve other UMK campuses that investigate the influence of this type of study programme on obesity and further explain its relationship with obesity. The researcher hopes that future studies can maintain the method of collecting data quantitatively from the intended respondents. This is because, the researcher has selected the population among university students at University Malaysia Kelantan City Campus as many as 357 students. Therefore, data were collected using an online questionnaires method to prevent the spread of Covid-19 outbreak. Future studies are strongly encouraged to use this method because researchers have now successfully conducted this study.

CONCLUSION

The major goal of this study is to look at the relationship between obesity and several factors among University Malaysia Kelantan City Campus students. According to the findings, obesity is caused by the effect on dependent variables among students at the University of Malaysia Kelantan City Campus. A total of 357 respondent were administered among university students

at the UMK City Campus, according to Chapter 3. Students from the faculties of hospitality, tourism, and wellness made up the response population. The results of the survey questionnaires are then evaluated using descriptive and inferential analysis in Chapter 4. The collected data from the surveys was analysed using the Statistical Package for the Social Sciences (SPSS) (SPSS). Finally, the results of the data analysis are summarised in Chapter 5. Therefore, all three hypotheses were accepted: H1, H2, and H3. Furthermore, the constraints and suggestions identified throughout this analysis included those that may be used in future research.

ABSTRACT

This study investigates the impact of MCO on mental health issues among UMK students. Mental health is an issue that causes depression, anxiety, irritability, and other uneasy emotions to continue to expand after a long period of MCO. University students who study at home also had a tendency to be affected by environmental factors around them, resulting in panic and psychological pressure. The research objective is to determine the relationship between a financial problem, non-conducive environment, education stress and mental health issues during MCO with UMK students. A total of 368 students from the 3 campuses of UMK were involved in this study. The findings of this study are gathered from the analysis of descriptive analysis and Pearson Correlation Coefficient. Based on the data analysis and findings; the most significant factor is the education stress which achieved the highest mean score of 0.60806.

Keyword: MCO, Mental Health Issues, Financial Problem, Non-Conducive Environment, Education Stress

INTRODUCTION

This chapter explains the impact of the Movement Control Order on mental health issues among University Malaysia Kelantan students. The content of this case study includes the problem statement, the study scope, research questions, research objectives, and significance of the study. The definition of this study is to identify, analyse and study the impact of Movement Control Order on mental health issues among University Malaysia Kelantan students. According to the World Health Organization (2004), mental is "a state of happiness, in which the individual is aware of his abilities and can cope with normal life pressure, work productively, and contribute to his or her community". Although it is still under debate, mental health is usually defined as a state of dynamic internal balance that needs to cope with life challenges to play a social role. This study is to aims at students' situations in different forms during MCO.

This study consists of three objectives:
1) To determine the relationship between financial problem and mental health during MCO among UMK students.
2) To determine the relationship between non-conducive environment with mental health issues during MCO among UMK students.
3) To determine the relationship between education stress and mental health during MCO among UMK students

Significance of the Study

Students

The findings of this study will benefit all students, which will raise awareness of mental health issues among students at the university. Therefore, this study can help students to prevent stress,

anxiety and depression caused by government orders. Building habits of learning during Movement Control Order (MCO) period can reduce educational stress at that time. Throughout this paper, we will learn a specific methodology to address the issues we often face. For cases, procedures to control anger, reduce anxiety or stress, or monitor impulses. Consider the response of this study and our periodic response to the stimuli that caused this study issue. At that point, find another solution to this problem. As with building a tendency, it takes time and even sharpens. If we do not build a new strategy to learn in the situation (MCO), we are at risk of stress and other diseases. It is caused by hormonal balance disorders in the body, which makes it difficult to control appetite due to thinking about the tasks given by the lecturers. In addition, this study can help develop modules of emergency programmes to prevent or reduce the number of statistical cases among students at public universities. However, this study will also help other researchers to study anxiety problems among university students in the future.

Community

This study can also benefit all communities to increase their knowledge and create awareness of the problems of mental health issues that are increasingly worrying. This is because the total rate of the number of people with mental health problems is increasing. Therefore, it can encourage the community for the importance of mental health care and the benefits of undergoing treatment and counselling to ensure better mental health. This study can be used as a reference for parents and students to start studying without experiencing mental health problems.

University

The study will also benefit the higher education institutions (HEI). The HEI can identify the number of students experiencing mental health issues at the University. Therefore, this study can help students to prevent stress, anxiety and depression caused by government orders. Building learning habits during the Movement Control Order (MCO) period can reduce educational stress at that time. The HEIs can also raise awareness among students about mental health and the value of mental and physical well-being.

Future Studies

For future research, this study can be referred to understand the problems of mental health issues among students at the university. Therefore, this study can help students to prevent stress, anxiety and depression caused by government orders. Building learning habits during the Movement Control Order (MCO) period can reduce educational stress at that time among university students. Moreover, through this research, it can be used as a reference and guideline by other researchers, especially in primary health education. In addition, other researchers can use data for different populations and areas for disorders of this mental health issue. In the same way, it raises awareness and improves a healthy quality of life especially to university students. So that this information can be used to develop modules or intervention programmes to reduce issues involving mental health among university students.

LITERATURE REVIEW

Mental Health Issues

Concurring to the WHO, mental health could be a state of well-being that the person realizes possess capacities. This person adapts to the ordinary stresses of life. An individual working productively and efficiently can create a commitment to their community. Mental well-being consolidates subjective well-being, intergenerational dependence, and self-actualization of individual minds. From the perspectives of favourable brain investigation or comprehensive

quality, mental well-being may consolidate an individual's capacity to appreciate life and creative energy to create an alteration between life works out and realize mental flexibility. Social contrasts, subjective appraisals, and competing proficiently with hypotheses influence some characterizes "mental health". A few early signs related to health issues are resting, bothering, needing vitality, and considering hurting themselves or others.

Based on World Health Organization (2019), mental well-being issues, known as mental, disarranges, directly impact well-being and social, human rights, and funds in all nations of the world. There are various unmistakable mental disarranges with different presentations. They are few characterised by a combination of atypical contemplations, discernments, sentiments, conduct, and associations with others. The mental disorder commonly known as wretchedness, bipolar disarranges, schizophrenia, other psychoses, dementia, and developmental clutters checking extremely introverted. There are few practical solutions for foreseeing mental disarranges, such as psychological changes. Health worldwide department appropriate medications for mental disorders and ways to ease the enduring through counselling. Getting to well-being care and social administrations competent of giving treatment and social back could be a key.

Mental health includes the functionality of an individual. If somebody endures a mental disorder without any appropriate channel, that individual may be a ticking time bomb. Anybody can encounter mental well-being issues. What varies from one to another is the affirmation of the need to get superior, or the sum of exertion one puts in overseeing mental health issues. Perception through Minister of Health Malaysia (MOH), 2021. Mental health and well-being specialists draw from other regions to illuminate their points of view. They audit a person's mental well-being inside the setting. An act may be psychopathological in one social issue. The most ranges from which counsellors, clinicians, and therapists pick up understanding approximately mental health (Dasgupta, 2013).

According to Dasgupta (2013) mental issues are related to the spiritual concept. This approach clarifies who we are inside the world and how we act. It tells us what we will expect after passing based on our exercises. The otherworldly perspective looks incredible and beastly as they relate to enduring. Another theory, mental issues also affect the moral character. This viewpoint shows that there are certain ethics an individual ought to learn. Last but not slightest is measurable. Whereas concurring with Bandura, people learn through discernment and demonstrating other people's conduct (McLeod, 2016). Mental wellbeing issues influence biopsychosocial, related to organic, mental, and social variables. It depends on the individual and their environment.

Financial Problem Factor

"The impact of the pandemic on people's mental health is already extremely concerning. Social isolation, fear of contagion, and loss of family members is compounded by the distress caused by loss of income and often employment." Dr T.A Ghebreyesus Director-General, WHO, (2021).

Concurring to UNESCO, the widespread has hindered the learning of more than one billion understudies in 129 nations worldwide. Numerous colleges worldwide have moved to crisis farther instructing (ERT) through online stages, encouraging actuating uneasiness among the understudies. Ponders on the impact of COVID-19 and lockdowns on college understudies in each nation detailed critical antagonistic impacts on the students' mental well-being and elevated uneasiness levels. A few consider having been conducted on the impacts of the COVID-19 widespread and lockdowns from the open well-being viewpoint.

Secondly, many institutions need closures due to the virus spreading outbreak. It would be the biggest challenge for parents to significantly consider the living costs because all the families need to follow the government order. The statement shows that parents with financial issues are more concerned about their teenagers and potentially lack educational matters due to COVID-19. Different situations show when affordable parents hire personal teachers or buy an education gadget (Vladimir. H, 2020). The statement reported by P. Research Center proposes the computerized gaps are especially eminent "Dark and Hispanic" families of low salaries. (Anderson & Auxier, 2020), proposing races and family income contribute to the complexity of extending instructive disparities due to the virus outbreak episode. This issue might be a problem to students about how they need to burden their parents that some households already have a problem with the money for living. Some parents need to stop their business due to this problem. When students stay at the university campus or hostel, parents do not have to spend much money on their children compared to when they stay home. It clearly creates problem to students.

Next, Concerning Prime et al. (2020) theoretical framework, the impact of social disruption due to movement control order includes loss of job, financial pressure, and social isolation. Including quarantine needs to be considered in the context of preexisting vulnerabilities in families. Although the current strain of the virus outbreak is unprecedented and affects everyone, the impact of the virus can be rooted in persistent social, economic, and educational disparities. Resulting in more significant vulnerabilities and difficulties in low-income families.

Non-Conducive Environment Factor

A non-conducive encompassing may incorporate insulant ventilated rooms, destitute framework, incompetency in managing with modern innovation, sounds related to unsettling physical influences, and diversions. These components can meddle with the smooth stream of data. For occurrence, if a put is boisterous, the sender will be occupied from informing, and some things a person try to communicate is improbable to be gotten within the same way by the recipient. Assist expressed that grown-up learner come into a learning circumstance with encounters, numerous of which may be straightforwardly or in a roundabout way related to the issues being discussed. The facilitator ought to make room for invitingness within the classroom for successful learning to require interaction within the course. Khalid (2008) appropriately observed that the issue of a conducive learning environment among grown-up learners could not be tended to without alluding to the teaching suspicions on which grown-up instruction is based. These suspicions incorporate self-concept, encounter, preparation to memorize, and introduction to learning. The concept of andragogy concurring to Ugwoegbu (2003) alludes to the craftsmanship and science of making a difference for grown-ups to learn.

Education Stress Factor

Academic stress is performance-related uneasiness. Few variables that contribute to scholastic stress are natural components contributing to the encounter of stretch, relative to the degree to which an individual has contributed their character within the results and the conditions they work. Academic stress includes mental trouble concerning expected academic challenges or disappointment or mindfulness of the plausibility of scholarly disappointment. During the school a long time, scholastic stressors may show up at any point in the adult's environment: residential, school, locality or companionship. (Kenned and Kouzma) the point that school-related circumstances such as tests, grades, looking at, self-imposed ought to succeed, which incited by others is the primary source of the push for higher school understudies. The impact of insightful extends to boot far-reaching. Elevated levels of an academic stretch have driven to destitute comes about inside the ranges of workout, food, substance utilization, and self-care.

Additionally, an insightful extend may well be a chance figure for psychopathology. For few grades, youthful women who have higher academic levels are more likely to include opinions of misery.

Academic stress rises from encountering pressure due to grant necessities, family-related pressures, competition inside the course, and course-related compression and budgetary issues. (Castillo & Misra, 2004) accomplished by understudies. A few understudies could be moving to a diverse place, learning distinctive social and dialects between expansion, and being balanced by scholarly necessities (Essandoh, 1995; Mori, 2000). Students continuously live beneath the pressure to implement superior to their peers. They are ceaselessly compared with families and other teenagers of their age by their instructors and companion. It continuously leads to a circumstance that causes children to be confused and beneath steady weight to perform, accomplishes superior grades, exceeds expectations well in the extracurricular task, take up leisure activity during the class session.

Higher institutions these days include peer weight of counting themselves in various works out isolated from the academic affiliation so that their peers can accept them in their bunches. As understudies experience a higher level of stretch rising from remarkable academic weight, most of them report experiencing low self-esteem, a down and out concentration that influences their academic execution. The acknowledgement of scholarly push adversely influences their well-being, choice to choose career choices, resting troubles, subconscious complaints, focusing on the comorbid conditions like uneasiness and misery, and disappointment to supervise course workload. (Gabriel & Bedewy, 2015; Iqbal & Acharya, 2003; et al., p.20).

Emotional insight is a developing subject for instructive, mental, and administration considers. The concept is related to understanding self-feeling, coordinating the enthusiastic responses and labelling the encounters of mixed feelings, making a difference for others to get it and offering assistance to individuals to channelize their feelings (Euphoria, 2005). It too alludes to handling emotional upsets, adjusting ways and capacity to maintain a strategic distance from emotional weariness. Including pressure, emotional self-control, burnout, and learning to maintain a strategic distance from the pessimism of feelings and taking care of selfishness (Sala, 2002, Mathur & Chandr, 2016).

Research Hypothesis

The hypothesis in the study is to find out if any correlations or relationships are allying the (DV) and the (IV):

H1: There is a significant relationship between financial problems with mental health during MCO among UMK students.
H2: There is a significant relationship between a non-conducive environment and mental health during MCO among UMK students.
H3: There is a significant relationship between education stress, including mental health, during MCO among UMK students.

Research Framework

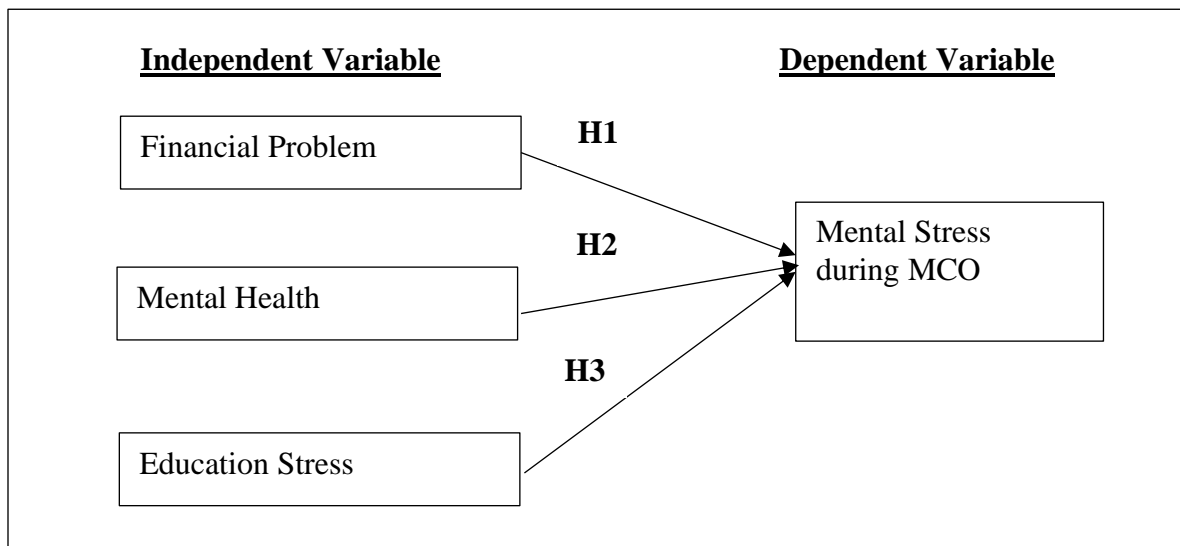
A research framework is proposed through a literature review to investigate the relationship between these factors and mental health issues. The proposed conceptual framework is shown in Figure 2.1. The proposed independent variable consists of three factors: financial problems, an uncomfortable environment, and educational stress. The dependent variable is the mental health issues of UMK students during the MCO period.


Figure 1: Research Framework

METHODOLOGY

Research Design

The research design used in this study was a quantitative approach of descriptive research. The development of quantitative research was chosen because the design of this study emphasises objective measurement, statistical, or numerical analysis of knowledge gathered through standardised interviews. In this study, the researchers wanted to identify and collect data on whether financial problems, non-conducive environments and educational stress under the impact of the MCO could contribute to the impact of mental health issues among University Malaysia Kelantan students.

Data Collection

In this study, the method researchers used to collect data was primary data, which was collected through a Google Form questionnaires. 368 respondents answered the Google Form questionnaires. The researchers will shared the Google Form questionnaires via social media namely WhatsApp and Telegram to UMK students across three campuses (City, Bachok and Jeli).

Sampling

Simple random sampling was used in this study. Using probability sampling representation allows the student population at each UMK campus (City, Bachok and Jeli) to have the same chance of being drawn, considering the distances between the three campuses and various unavoidable obstacles. In these studies, the researchers used Krejcie & Morgan's (1970) theories to determine the sample size by using the formula of this equation below:

$$S = \frac{x^2 N p (1 - p)}{e^2 (N - 1) + X^2 p (1 - p)}$$

S = The Sample Size Required
N = The Population Size
P = Prevalence
d = The Degree of Accuracy
x2 = 3.841 For The 95% Confident Level

168

DATA ANALYSIS

The current chapter will be assigned for presenting findings of the study. IBM SPSS versions 26 were used to analyse the existing data using some of the statistics analyses related to the main aim for this study. The chapter consists of descriptive analysis which provided characteristics of respondents from the demographic profile. A pilot study is conducted to validate the questionnaire and the result is presented in reliability analysis. Preliminary analysis presents normality checking from overall data. This chapter will also provide the results of correlation analysis.

RELIABILITY

Reliability analysis was conducted on the measurement scales of all constructs. The Cronbach's alpha is used as a measure of reliability or internal consistency. The closer the value of reliability coefficient to 1.0, then the measure is better. Based on the rule of thumb, reliability values less than 0.60 are indicated as poor, those in the range of 0.70 are acceptable and those over 0.80 considered good. Table 4.1 shows the result of the reliability analysis for each of the construct used in this study. Overall, the values of Cronbach's alpha for all research variables are more than acceptable and recommended value of 0.7. This shows that all the 21 selected items are reliable and valid to measure the variables.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the result of frequency analysis of this research.

Table 1: Frequency Analysis

Item	Frequency	Percentage (%)
Gender		
Male	135	36.7
Female	233	63.3
Age (Years old)		
17 – 19	33	9.0
20 – 22	145	39.4
23 – 25	190	51.6
Race		
Malay	202	54.9
Indian	38	10.3
Chinese	54	14.7
Sabah & Sarawak Native	71	19.3
Others	3	0.8
Religion		
Muslim	216	58.7
Christianity	41	11.1
Buddhism	45	12.2
Hinduism	36	9.8
Others	30	8.2
Campus		
City Campus	163	44.3
Bachok Campus	146	39.7
Jeli Campus	59	16.0
Year of Studies		

Year 1	65	17.7
Year 2	64	17.4
Year 3	177	48.1
Year 4	54	14.7
Year 5	8	2.2

Based on the Table 3, out of 368 respondents, percentage of male and female of students at University Malaysia Kelantan is 36.7% and 63.3% respectively. Regarding to the age group, majority of students at University Malaysia Kelantan are 23-25 years old (51.6%) while 20-22 years old (39.4%) and 17-19 years old (9.0%). For race, most of the respondents are Malay (54.9%) followed by Sabahan & Sarawakian Native (19.3%), Chinese (14.7%), Indian (10.3%) and others (0.8%). Other than that, majority of the students at University Malaysia Kelantan are Muslim (58.7%) as their religion while Buddhism (12.2%), Christianity (11.1%), Hinduism (9.8%) and others (8.2%). Besides that, most of the students at University Malaysia Kelantan are from City Campus (44.3%) followed by Bachok Main Campus (39.7%) and Jeli Campus (16.0%). Table 4.2 also shows that majority of the students at University Malaysia Kelantan are 3 (48.1%) followed by Year 1 (17.7%), Year 2 (17.4%), Year 4 (14.7%) and Year 5 (2.2%).

Result of Descriptive Analysis

Descriptive analysis is used to describe the mean and standard deviation of each item for each variable in this study. The descriptive analysis also provides the percentage of the agreement for each item in each variables studied.

4.5.1: Mental Health Issues

Table 2: Mental Health Issues

Items	Disagree	Neutral	Agree	Mean	SD
I can't experience positive feelings at all	149 (40.5%)	111 (30.2%)	108 (29.3%)	1.89	0.829
I think I use a lot of energy in anxiety.	102 (27.7%)	135 (36.7%)	131 (35.6%)	2.08	0.793
I worry about situations where I might panic and do stupid things to myself.	108 (29.3%)	133 (36.1%)	127 (34.5%)	2.05	0.799
I feel sad and depressed	133 (36.1%)	128 (34.8%)	107 (29.1%)	1.93	0.806
Have you ever had any suicidal thoughts or attempted suicide?	156 (42.4%)	114 (31.0%)	98 (26.6%)	1.84	0.817
Mean				1.958	0.6050

Item 2 "I think I use a lot of energy in anxiety." shows that it has the highest mean (2.08) with standard deviation 0.793 while item 5 "Have you ever had any suicidal thoughts or attempted suicide?" shows the lowest mean (1.84) with standard deviation 0.817. Table 4.14 also shows that majority respondent disagree for the item 1 "I can't experience positive feelings at all", item 4 "I feel sad and depressed" and item 5 "Have you ever had any suicidal thoughts or attempted suicide?" while items 2 "I think I use a lot of energy in anxiety." And item 3 "I worry about situations where I might panic and do stupid things to myself." show that majority of the respondents do have neutral responses.

Financial Problem

Table 3: Financial Problem

Items	Disagree	Neutral	Agree	Mean	SD
I always think about how to get money	63 (17.1%)	142 (38.6%)	163 (44.3%)	2.27	0.736
I always suddenly wake up in the middle of night because of financial issue	155 (42.1%)	119 (32.3%)	94 (25.5%)	1.83	0.807
I am always sad thinking about this issue	89 (24.2%)	143 (38.9%)	136 (37.0%)	2.13	0.772
I always hesitant to spend	71 (19.3%)	149 (40.5%)	148 (40.2%)	2.21	0.744
I feel scared to face my families	129 (35.1%)	119 (32.3%)	120 (32.6%)	1.98	0.823
Mean				2.084	0.59513

Table 3 shows that item 1 "I always think about how to get money" does have the highest mean (2.27) with standard deviation 0.736 while item 2 "I always suddenly wake up in the middle of night because of financial issue" has the lowest mean (1.83) with standard deviation 0.807. Besides, Table 4.2 also shows that majority of respondents disagree on the items 2 "I always suddenly wake up in the middle of night because of financial issue" and item 5 "I feel scared to face my families". Most of the respondents agree on item 1 "I always think about how to get money" while for the item 3"I always sad thinking about this issue" and item 4 "I always hesitant to spend" neutral responses from the respondents.

4.5.3 Non-Conducive Environment

Table 4: Non-Conducive Environment

Items	Disagree	Neutral	Agree	Mean	SD
I feel uncomfortable studying in noisy conditions	47 (12.8%)	110 (29.9%)	211 (57.3%)	2.45	0.710
The internet access in my home area is unsatisfactory and interferes my studies concentrations	129 (35.1%)	128 (34.8%)	111 (30.2%)	1.95	0.807
My family and siblings do not cooperate well during online study sessions	152 (41.3%)	108 (29.3%)	108 (29.3%)	1.88	0.833
My housing area is near the industrial area and noise pollution interferes with my learning process	149 (40.5%)	120 (32.6%)	99 (26.9%)	1.86	0.811

My cramped, hot and dense residence disrupts my focus when attending online lectures	148 (40.2%)	110 (29.9%)	110 (29.9%)	1.90	0.832
Mean				2.008	0.5888

Item 1 "I feel uncomfortable studying in noisy conditions" shows the highest mean (2.45) with standard deviation 0.710 while item 4 "My housing area is near the industrial area and noise pollution interferes with my learning process" shows the lowest mean (1.86) with standard deviation 0.811. Table 4.3 also shows that majority respondents disagree for item 2 "The internet access in my home area is unsatisfactory and interferes my studies concentrations", item 3 "My family and siblings do not cooperate well during online study sessions", item 4 "My housing area is near the industrial area and noise pollution interferes with my learning process" and item 5 "My cramped, hot and dense residence disrupts my focus when attending online lectures" while item 1 "I feel uncomfortable studying in noisy conditions" shows that majority of the respondents agree on it.

4.5.4 Education Stress

Table 5: Education Stress

Items	Disagree	Neutral	Agree	Mean	SD
I suffer from insomnia; sleep quality is not good	124 (33.7%)	109 (29.6%)	135 (36.7%)	2.03	0.840
I feel irritable, impatient, violent, or dispiritedly	132 (35.9%)	127 (34.5%)	109 (29.6%)	1.94	0.808
I found myself having lost interest in participating in previously enjoyed leisure activities	139 (37.8%)	125 (34.0%)	104 (28.3%)	1.90	0.808
I feel appetite increases or decreases in life	106 (28.8%)	125 (34.0%)	137 (37.2%)	2.08	0.809
I was indifferent, complaining, harsh too high or low self-confidence in learning	122 (33.2%)	142 (38.6%)	104 (28.3%)	1.95	0.783
I felt restless, anxious, and nervous at exam time	99 (26.9%)	135 (36.7%)	134 (36.4%)	2.10	0.791
Mean				2.001	0.6080

Table 5 shows that item 6 "I felt restless, anxious, and nervous at exam time" does have the highest mean (2.10) with standard deviation 0.791 while item 3 "I found myself having lost interest in participating in previously enjoyed leisure activities" demonstrates the lowest mean (1.90) with standard deviation 0.808. Besides, Table 4.4 also shows that majority of the respondents does disagree on the item 2 "I feel irritable, impatient, violent or dispiritedly" and item 3 "I found myself having lost interest in participating in previously enjoyed leisure activities". Most of the respondents agree on item 1 "I suffer from insomnia, sleep quality is not good" and item 4 "I feel appetite increases or decreases in life" while for the item 5 "I was

indifferent, complaining, harsh too high or low self-confidence in learning" and item 6 "I felt restless, anxious, and nervous at exam time" shows neutral responses from the respondents.

Results of Reliability Analysis

Table 6 below shows the reliability analysis of this research.

Table 6: Reliability Results

Variables	Items	Cronbach's Alpha
Mental Health	5	0.803
Financial Problem	5	0.824
Non-Conducive Environment	5	0.789
Education Stress	6	0.848

Result of Pearson Correlation Analysis

Correlation generally describes the effect that two or more phenomena occur together and therefore they are linked. This can be ranged from -1 to 1. This study used the Pearson Correlation test to examine whether financial problem, non-conducive environment, education stress and mental health does have relationship. We used the guide that Evans (1996) suggests for the absolute value of r*.

Table 7: Results of Pearson Correlation

Parameter	Mental Health	Financial Problem	Non-Conducive Environment	Education Stress
Mental Health	1.000			
Financial Problem	0.557	1.000		
Non-Conducive Environment	0.530	0.598	1.000	
Education Stress	0.658	0.600	0.617	1.000

*All values in are significant (p < 0.05)

The first objective of this study is to determine the relationship between financial problem and mental health. Table 4.6 shows that the p-value = 0.000 which is less than α= 0.05. This indicate that we reject the null hypothesis in which there is a relationship between financial problem and mental health. With the value of r=0.557, it shows that financial problem and mental health have positive relationship with moderate relationship. Therefore, it can conclude that there is a positively moderate relationship (r=0.557) between financial problem and mental health.

The second objective of this study is to determine the relationship between non-conducive environment and mental health. The value of p-value = 0.000 on Table 4.6 shows that it was less than α= 0.05. Therefore, the null hypothesis was rejected which is there is a relationship between non-conducive environment and mental health. Since the r = 0.530, it means that non-conducive environment and mental health have positive relationship with moderate relationship. In conclusion, there is a positively moderate relationship (r=0.530) between non-conducive environment and mental health.

173

And the last objective of this study is to determine the relationship between education stress and mental health. Table 4.6 showed that the p-value = 0.000 which is less than α= 0.05 that resulted to reject the null hypothesis. Therefore, there is a relationship between education stress and mental health. With the value of r=0.658, it shows that education stress and mental health have a positive relationship with strong relationship. Therefore, it can be concluded that there is a positively strong relationship (r=0.658) between education stress and mental health.

Conclusion

Based on the findings of this study for all three hypotheses, it can be concluded that all three null hypotheses were accepted. The summary of the hypothesis as shown on the Table 4.7.

Table 8: Summary of Hypothesis

No	Hypothesis	Results
1	H0: There is no relationship between financial problem and mental health. H1: There is a relationship between financial problem and mental health.	H1 is supported
2	H0: There is no relationship between non-conducive environment and mental health. H2: There is a relationship between non-conducive environment and mental health.	H2 is supported
3	H0: There is no relationship between education stress and mental health. H3: There is a relationship between education stress and mental health.	H3 is supported

Based on the findings of this study, it can be concluded that all three factors (financial problem, non-conducive environment, and education stress) do have a positive relationship with mental health. The results indicate that financial problem and non-conducive environment does have a moderate relationship while education stress have a strong relationship with mental health. In conclusion, all three factors (financial problem, non-conducive environment, and education stress) do have a positive relationship with mental health among students at University Malaysia Kelantan and financial problem and non-conducive environment does have a moderate relationship while education stress have strong relationship.

DISCUSSION AND RECOMMENDATION

Discussions are aimed at solving questions and addressing hypotheses as mentioned in the first chapter of this study. In general, this study has extensively researched the awareness of mental health issues among University Malaysia Kelantan students during the Movement Control Order. Based on the findings of the study, the current study would provide several recommendations on how students can try to avoid having mental health issue and how to cure it for students who already faced mental health issues and expressed concern regarding the improvement that can be made in future studies.

So, one of the ways that can be done is to find a distraction "Psychologists know that when people are in chronically difficult conditions it's helpful to divide the problem into two categories: things they can do something about, and then things they can do nothing about". There is going to be a lot in that second category right now, and that fine, but what can help us cope are distractions. Dr. Damour suggests doing homework, watching favourite movies, or reading books, as ways to make it easier for us and to find a balance in everyday life. Next, try to participate in some seminar about how to control ourselves. For students during MCO, it is hard to cope everything so participate in this kind of event can lead to a good situation for students who think that they perhaps need some consolation to avoid mental health issue. Other

recommendation is from the government itself. Government needs to do something for the student when they declare that the country is going to have MCO. Government can afford to do activities via online that can make students forget what they are facing right now. Boosting students' performance can make them forget a stressful event.

CONCLUSION

In conclusion, this study was conducted to determine the impact of movement control order on mental health issues among students University of Malaysia Kelantan. Three independent variables namely financial problem, non-conducive environment, and education stress with a dependent variable which is the mental health issues of UMK students during MCO period have been used to tase the hypotheses in this study. A total of 368 respondents aged between 17 to 25 years were selected among students of University Malaysia Kelantan to study the impact of Movement Control Order on mental health issues.

ABSTRACT

The goal of this study is to look at the relationship between mental health and factors that influence mental health, such as time management, individual stress, and academic stress, among working students in Malaysia. The sample of this study includes 384 working university students in Malaysia coming from different courses, backgrounds, ages, and genders. Data are gathered through questionnaires that are distributed via Google Forms and social media. Statistical Package for the Social Science (SPSS) is used to evaluate the data obtained from the questionnaires. This study finds that there is a significant relationship between mental health among working students in Malaysia and time management, individual stress and academic stress.

Keyword: Mental Health, Time Management, Individual Stress, Academic Stress

INTRODUCTION

University student's mental health is a serious issue because it affects both their academic performance and entire well-being. Academic accomplishment is one of the indications of a student's productivity, and a highly productive individual is a valuable asset to the development of a country (Shamsudin, and Chee, 2016). Mental illness is a life-threatening yet non-contagious illness. However, society often overlooks the reality that mental health issues imply an emotional toll as well as a sense of obligation on the side of the patient's family and authorities to treat the patient as long as the patient is alive. Students' understanding on mental health is relatively limited compared to their understanding of other illnesses such as heart disease, cancer, and so on. As a result, various media campaigns to raise public awareness and knowledge of the condition have been done.

Students in higher education are susceptible to mental illness such as depression, anxiety, and stress. These psychological concerns, according to Malaysian studies, may contribute to lower academic achievement among Malaysian university students (Sherina et al. 2003; Md Aris Safree Md. Yasin and Mariam Adawiyah Dzulkifli 2009; Zaid et al. 2007). However, none of these studies have examined the total influence of mental health disorders on student's' academic performance. The effect of other factors on academic success, such as demographic, socioeconomic, and environmental factors, can be seen using econometric models while simultaneously correcting them. Estimating the impact of mental health on academic achievement is essential for establishing effective interventions. The research objectives of this study are as follows:

1. To determine the relationship between time management and mental health among working students in Malaysia.

2. To study the relationship between individual stress and mental health among working students in Malaysia.
3. To identify the relationship between academic stress and mental health among working students in Malaysia

Significance of Study
Students

Working students' stress, anxiety, and depression levels are strongly influenced by their mental health. Mental health problem issue is becoming more common nowadays, suggesting that they should be properly addressed. For the benefit of students' mental health and well-being in the future, underlying risk factors and immediate interventions are required. According to statistics, 1% of the people suffer from mental illness while 20% suffer from mental health problems (Bernama, 2018). The most frequent mental illnesses are sadness, stress, and anxiety (Bernama, 2018). According to Gollust and Golberstein (2019), mental health problems among students are on the rise. Furthermore, the findings of this study will equip working students with early information on how to manage stress.

University's Management

This study also benefits the university's management. The university's management can identify the total number of students who are facing mental health problem especially among working students and find out the causes that lead to the problem. The university's management also can increase the awareness to university students about the importance of mental health and how the students can manage mental health problem. According to Eva (2019), university's management also plays an important role in preventing student mental health problems. Professor Gavin Andrews (2018) has organized a program for his students to identify whether his students have mental health problems and at the same time find out what are the main causes of mental problems among students.

Students' Family

This study also may help students' family in dealing with mental health problems. According to Dr Salina Sen (2019), students with mental health problems are more likely to commit suicide. This is because, they cannot think rationally and there is only one solution that they can think of which is to commit suicide. The role of the family is very important in preventing mental health problems especially among working students. Parents need to play their role in asking about the problems that their children are facing in education, at work and financial condition. According to Dr. Fauziah Mohd Saad (2019), communication between parents and students can help the students to reduce their stress and at the same time parents can find out and solve their problems in a good way.

LITERATURE REVIEW
Definition of Mental Health

Mental health can be defined as a state of well-being in which every individual realizes his or her own potential in coping with the normal stress of life or being able to work productively and able to make contribution to his or her community. One in ten students has thought of committing suicide due to stress. Meanwhile, one in five students suffers from depression, and one in ten students suffers from emotional stress The symptoms of mental health problems are usually described in terms of negative emotions such as pain, stress, and exhaustion.

Awareness of mental health problems is very important for everyone especially to students. Whether they choose to be healthy or not, students begin to take responsibility for their own

life decisions and lifestyles in university. Several researchers have investigated the factors that predict depression among university students. The most widely researched socio demographic variables are age and family socioeconomic status, with lower rates seen in students from higher-income homes. Students who are financially struggling have greater rates of depression.

Time Management

Hunt et. al. (2010) has investigated the relationship between time management among working students and a sense of coherence which is thought to minimize vulnerability to stress. For many students, it is necessary to work part time while studying. This can cause them to lose a lot of free time that should have been used to study and review lessons, but they really need to work to earn money. Working has become an essential responsibility to them. The reasons why students work make it difficult to understand how employment influences their educational experiences. Many students are required to work to cover the costs of attending college.

Individual Stress

Almost all university students throughout Malaysia face mental health problems. However, there are also mental health problems faced by students that are caused by their part time work. Working students must put in more effort than the other students because they need to manage their time wisely between study and work. Students in Malaysia are always under stress and this situation continuously occurs in a different situation throughout the study process.

There are several factors that lead students to work while studying. If this is the case, it causes an individual stress. The main factors of individual stress among students are family issues, emotional issues, financial issues and social issues. Financial stress occurs when students want to have a luxurious life for their future and have to pay off debts and for those who come from poor families, they need money for daily expenses. Working puts them under pressure as it requires a lot of commitment to be a student and at the same time, an employee. Instability of family institutions is among the factors leading to mental health problem among adolescents. Stress is also caused by financial problems that are commonly experienced by university students. Stable financial resource is a necessity for a student in pursuing knowledge.

Academic Stress

Students most often experience stress in learning. As working students, they are expected to meet their work demands and at the same time, they also need to complete their studies. Stress is the product of a number of concerns, including the pressure of assessments and assignments, difficult subjects, diverse school programs, and planning for post-graduation career. Most working students suffer from mental health problems because they need to perform academically and at the same complete the tasks of their. Working may detriment their exam results or CGPA because working students spend more time working than studying.

If students are not good at managing time, students will face stress and if this continues, it can lead to mental health problems. Studying at university is not an easy responsibility. It takes a lot of energy, time and sacrifice to get excellent results. Moreover, it is necessary to complete the assignments for all the subjects that they take. If students use their rest time to work, it certainly will compromise their life balance and academic performance.

Research Hypothesis

Based on the study, three hypotheses have been created and developed and tested:

H1   There is a significant relationship between time management and mental health among working student in Malaysia

H2   There is a significant relationship between individual stress and mental health among working student in Malaysia.

H3   There is a significant relationship between academic stress and mental health among working student in Malaysia

Research Framework

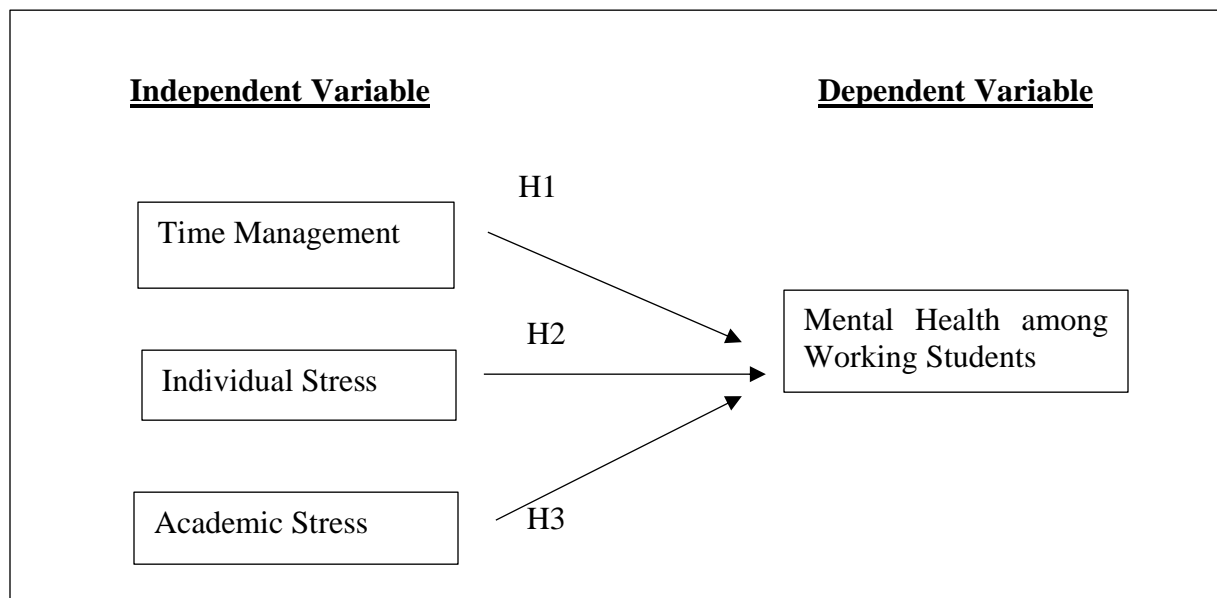
Figure 1 below shows the research framework use for this study.


Figure 1: Research Framework

METHODOLOGY

Research Design

Research design can be defined as the overall strategy used to conduct the research. It gives a simple and logical plan of solving the research questions set through the collection, interpretation, analysis, and discussion of data (Claybaugh & Zach, 2020).

Qualitative research is the method for market research by obtaining data through open-ended questions and conversation with the consumers (Fletcher, 2002) while quantitative research design is the process of collecting and analyzing numerical data from the participant by asking specific questions, narrowing the scope of questions, and analyzing the numbers using statistics. (Cresswell, 2008). Mix method research design can be defined as the combination between at least one qualitative and one quantitative research component. On this research design, there are three different types of research methods which are experimental studies, surveys, correlational studies or quasi-experimental review studies (Schoonenboom, 2017). Research designs also include the elements of data collection, measurement of data with the respective tools, and the analysis of the data (Cameron, 2014).

Research design for this study is quantitative design. When using quantitative research design, the researcher can collect data and information quickly. Quantitative research design uses

181

randomized samples and the result of the data in quantitative research design cannot be duplicated. Last but not least, quantitative research design allows the researcher to reach a higher sample size.

Data Collection

Data collection can be defined as the procedure of collecting, measuring and analyzing accurate data for research by using standard validated technique. Data collection enables a person or researcher to answer related questions, evaluate results and analyze accurate insights for research regarding upcoming probabilities and trends (Rouse, 2020).

This study uses primary data. A questionnaire will be used to collect primary data. About 384 respondents have answered the questionnaire. The questionnaires have been shared with researchers' friends, and they will oversee spreading them to their other friends in other university through WhatsApp, Facebook, Instagram and other social media. This questionnaire is conducted online.

Sampling

The researcher will use the non - probability sampling techniques because samples are not selected randomly. This type of sample is easier and cheaper to access. Purposive sampling is used for this study because the researcher knows the specific characteristics that exist in the population or the respondents.

This is often accomplished by applying expert knowledge of the population to select a sample of elements that represents a cross-sectional of the populations in a non-random manner. Respondents are undergraduate students who are working in every university in Malaysia. We choose the specific place and the location of the study to develop the sample size from the respondents from all working students. This research is conducted to determine the factor that is associated with depression that will be assumed by the university students.

Data Analysis

In this study, data from the questionnaire are analyzed through descriptive statistics and Pearson correlation. A tool used in analyzing the data is a statistical tool called Statistical Package Social Science (SPSS) version 27 programmed operation software. SPSS data will be interpreted into statistics such as good percentage and cumulative percentage.

By focusing on the size of the relationship coefficient, Pearson Correlation Analysis is used to simplify the strength of the connection between the independent and dependent variables. The strength of the link between IV and DV is measured using the range of the connection coefficient (r) table. It uses Common Features and reference to relationship is measured from -1.0 (perfect negative) to +1.0 (perfect positive). Coefficient can be close to zero when two variables have non-linear relationships. Existence of high correlation between two variables does not explain why relationships exist.

FINDINGS

 Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Frequency Analysis (n=384)

Variable	Categories	N	Percentage (%)
Gender	Female	269	70.1
	Male	115	29.9
Age	18-20years old	40	10.4
	21-23years old	257	66.9
	24-26years old	69	18.0
	27 years old and above	18	4.7
Race	Malay	347	90.4
	Chinese	22	5.7
	Indian	7	1.8
	Other	8	2.1
Level of Academic	STPM and below	19	4.9
	Certificate	26	6.8
	Diploma	84	21.9
	Degree	242	63.0
	Postgraduate	11	2.9
	Other	2	0.5
Years of Study	Year 1	65	16.9
	Year 2	118	30.7
	Year 3	155	40.4
	Year 4	11	2.9
	Other	35	9.1
University	UMK	124	32.3
	USM	22	5.7
	UITM	55	14.3
	UNIMAS	18	4.7
	UMS	22	5.7
	UKM	20	5.2
	Other	123	32.0
Types of work	Full time	82	21.4
	Part-time	302	78.6
Occupation	Online Business	148	38.5
	Sell Burgers	28	7.3
	Food panda/ grab food	22	5.7
		33	8.6
	Business owner	153	39.8
	Other		

Salary	RM 100-300/ month	99	25.8
	RM 400-600/ month	134	34.9
	RM 700-1000/ month	124	32.3
	RM 1000 and above	27	7.0

Table 1 above shows the demographic characteristics of working students in Malaysia. Based on the table above, it shows that majority respondents are female respondents, 70.1% and 29.9% of them are male respondents. Among these 4 age groups, the range of 21 to 23 years old is the highest percentage (66.9%) of respondents followed by 24-26 years old (18.0%) and 18-20 years old (10.4 %). The oldest group, 27 years old and above, was the least (4.7 %).

Malay respondents have the highest percentage among the respondents (90.4%). Chinese and other races contributed to 5.7% and 2.1%, respectively. Indian respondents have the least percentage, 1.8%. Malay students tend to be more cooperative and easier to be approached than the other races. They are willing to spend their time answering the questionnaires.

The degree level group has the highest percentage among the respondents (63.0%). The second highest is diploma level (21.9%). Certificate level and STPM and below both of them have the percentages of 6.8 and 4.9. Meanwhile, the percentage of postgraduates is 2.9 and other qualifications is 0.5.

Year 3 students have the highest percentage among the respondents (40.4%), followed by year 2 (30.7%) and year 1 (16.9 %). Year 4 respondents have the lowest percentage among the working students (2.9%) and other years have the percentage of 9.1%. For types of university, UMK students are the highest among the respondents (32.3%) followed by other universities (32.0%) and UITM (14.3%). UNIMAS students records the lowest percentage of respondent participation (4.7%). USM and UMS have the same percentages (5.7) and there is 5.2% involvement among UKM students.

For this type of work, most of the students work on a part-time basis, 78.6 % and 21.4% of them are full time workers. The main reason for this result is that many students can do part-time job while they are studying. In terms of occupation, a high percentage of working students are in online business 38.5%. 8.6 and 7.3% of them were business owners and burger sellers. The lowest percentages were food panda/ grab food (5.7%).

Lastly, for salary, it is obvious that RM 400-600 per month is the highest percentage among the respondents (34.9%). Next, the second and the third highest percentage are RM 700-1000 per month and RM 100-300 per month with the percentage of 32.3% and 25.8%, respectively. However, RM 1000 and above has the lowest percentage among the respondents with the percentage of 7.0.

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research.

Table 2: Descriptive Analysis

Variable (IV)	Items	Mean Score	SD
	I can divide my time between studying and working	2.33	1.13

184

Time Management	I know how much time I spend on studying and working	2.58	1.22
	I think I use my time effectively during studying and working	2.59	1.13
	I am stressed about deadlines of assignments and commitments of work	2.89	1.31
	I spend more time on work because working is more important than studying	3.01	1.25
Individual Stress	I work while studying because I have financial problems.	2.83	1.22
	I work while studying because I want to pay for university fees and for daily use	3.04	1.27
	Although I am a working student, I wisely divide my time between work and study	2.80	1.20
	I will not spend my money on useless things	2.63	1.16
	Although working during studying is tiring, I will make sure I have adequate rest so I don't affect my emotions and mental while studying.	2.63	1.16
Academic Stress	I am able to study while working	2.65	1.16
	My academics will not be affected even if I work	2.72	1.21
	I am capable of completing all assignments while working.	2.66	1.22
	When I get a new assignment, I will complete the assignments first, then work	2.70	1.20
	Even though I am working, my exam results are unaffected.	2.78	1.19
Mental Health among Working Students	I am able to deal with stress and pressure even though I am busy studying and working	2.46	1.11
	I will always think positive even when I am under the pressure from assignments and working	2.57	1.23
	I will make sure I get adequate rest both physically and mentally	2.59	1.18

	I am aware that mental health is very important to me in managing daily work	2.45	1.31
	I will complete the assignment on time so that I will not be stressed with the upcoming assignments	2.45	1.23

Table 3: Mean score and standard deviation

Variable	Item	Mean Score	Standard Deviation
Time Management	5	2.68	0.27
Individual Stress	5	2.78	0.16
Academic Stress	5	2.70	0.05
Mental Health	5	2.50	0.06

Table 2 and 3 show the mean and standard deviation for fifteen questions under independent variable and five questions under dependent variable based on the survey that involves working students in Malaysia. The highest mean value for time management factors is 3.01, obtained by Question 5, where the respondents agree that they spend more time on work because working is more important than studying. The lowest mean value is 2.33 for Question 1, where the respondents agree that they can divide their time between studying and working. For individual stress factors, the highest mean value is 3.04, obtained by Question 2, where the respondents agree that they work while studying because they want to pay for university fees and other daily use. The lowest mean value is 2.63 for Question 4 and 5, where the respondents agree that they will not spend their money on useless things and although working during studying is tiring, they will make sure they have adequate rest so as not to affect their emotions and mental health while studying. Meanwhile, the highest mean value for academic stress factors is obtained by Question 5 at 2.78, where the respondents agree that even though they are working, their exam results are unaffected. The lowest mean value obtained by Question 1 is 2.65, where the respondents agree that they are able to study while working. Lastly, the highest mean value for mental health among working students is obtained by Question 3, where the respondents agree that they will make sure they get adequate rest both physically and mentally. Meanwhile, the lowest mean value is obtained by Question 4 and 5, where the respondents agree that they are aware that mental health is very important to them in managing daily work and they will complete the assignment on time so that they will not be stressed with the upcoming assignments.

Result of Reliability Analysis

Table 4 below shows the reliability analysis of this research

Table 4: Reliability Analysis

Variable	Items	Cronbach's Alpha
Time Management	5	0.678
Individual Stress	5	0.733
Academic Stress	5	0.884

Mental Health	5	0.892

The result of the reliability analysis is indicated in table 4. The Cronbach Alpha value of time management is 0.678, followed by individual stress with 0.733, academic stress at 0.884, and mental health at 0.892. Consequently, the questionnaire is reliable and valid to be utilised for the study.

Result of Pearson Correlation Analysis

Table 5 below shows the result of correlation analysis of this research.

Table 5: The Pearson Correlation Analysis

Hypothesis	p - Value	Result (Supported/Not Supported)
H1: There is a significant relationship between time management and mental health among working student in Malaysia	0.685	H1 is supported
H2: There is a significant relationship between individual stress and mental health among working student in Malaysia.	0.692	H2 is supported
H3: There is a significant relationship between academic stress and mental health among working student in Malaysia	0.729	H3 is supported

The relationship between time management and mental health among working students in Malaysia is moderate positive r =0.685. This implies that the relationship between time management and mental health among working students in Malaysia is moderate positive. The p value of time management is .000 which is less than the highly significant level .001. Therefore, there is a significant relationship between time management and mental health among working students in Malaysia.

Meanwhile, the relationship between individual stress and mental health among working students in Malaysia is moderate positive with correlation coefficient of 0.692. This implies that the relationship between individual stress and mental health among working students in Malaysia is moderate positive. The P value of the individual stress is .000 which is less than the highly significant level .001. Therefore, there is a significant relationship between individual stress and mental health among working students in Malaysia

Lastly, the relationship between academic stress and mental health among working students in Malaysia is moderate positive with correlation coefficient of 0.729. This implies that the relationship between academic stress and mental health among working students in Malaysia is moderate positive. The P value of the academic stress is .000 which is less than the highly significant level .001. Therefore, there is a significant relationship between academic stress and mental health among working students in Malaysia.

DISCUSSION AND RECOMMENDATION

Based on the table, Pearson's Correlation Analysis was used in testing the relationship between hypotheses on a significant relationship such as time management, individual stress, and

academic stress with mental health among working students in Malaysia. The result shows that all hypotheses stated are accepted at 0.01 significance level. The researcher collected the questionnaire responds through Google Forms. Thorough instructions are included in this questionnaire to help respondents answer the question accurately. In this study, the respondents are working students in Malaysia to gather the data. Several empirical elements of factors that determine mental health among working students in Malaysia are discussed in the previous chapter. As a result, suggestions for future research are concluded.

The first suggestion is future researchers should not depend entirely on Google Forms to collect data. Face-to-face surveys and interviews should also be used in future studies. Face-to-face interviews allow for a clear understanding of the respondents' mental health behavior as it can provide more reliable, consistent, and accurate data for research.

The second suggestion is for the research to be conducted in multiple languages, not only English and Malay languages, but also Mandarin and Tamil to cater for other races in Malaysia. This will make it easier for respondents of other races to comprehend the question, hence enables the researcher to collect data more precisely, reliably, and efficiently. Furthermore, because the questions received are in a variety of ethnic languages in Malaysia, it may raise respondents' interest to complete the questionnaire.

CONCLUSION

The main purpose of this research is to determine mental health among working students in Malaysia. The influential factors which are time management, individual stress and academic stress (independent variables) that affect mental health among working students in Malaysia (dependent variables) are analysed in this research. As mentioned in Methodology, a total of 384 questionnaires have been distributed to 384 respondents among working students in Malaysia and all of them are valid

The Impact of Pandemic Covid-19 on the Spa And Wellness Industry In Klang Valley.

Mohammad Syahmi, Leong Kah Man, Sitit Norshirah, Riena Syazwana, &* Hasif Rafidee

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email: rafidee@umk.edu.my

ABSTRACT

Covid-19 has significantly affected the spa and wellness industry in Klang Valley. This is because the disease is spread by the virus quickly and easily (Joost, 2020). Besides that, the coronavirus (COVID-19) pandemic had a significant impact on the spa and wellness industry in Klang Valley as many establishments were forced to close in order to avoid gatherings of people in public areas. At the same time, the pandemic has caused the shutdown of spas and wellness centres leading to unemployment, and Malaysia's economy has also declined extremely fast. A quantitative study was conducted to determine the impact of the pandemic Covid-19 on the spa and wellness industry around Klang Valley in terms of work performance, unemployment rate, and financial performance. This research employed a probability or random sampling technique. In addition, questionnaire surveys were used for data collection. The questionnaires were distributed online, and the data were collected among the respondents involved in operating the spa and wellness industry in Klang Valley. The survey was conducted online due to the restriction order on movement to curb the spread of Covid-19.

Keywords: Covid-19, Spa and Wellness Industry, Work Performance, Unemployment Rate, Financial Performance

INTRODUCTION

Humanity is recognizing the importance of focusing on healthier and better living situations in the future. According to the World Health Organization, 'wellness' defines as a state of complete physiological, emotional, and societal well-being. In addition, wellness will allow people to live a healthy lifestyle that ensures their mental and physical well-being. Besides, wellness is made up of numerous components that work together to build an ecosystem, such as wellness tourism, wellness real estate, workplace wellness, spa, and so on.

In addition, Covid-19 is one of the most dangerous diseases that can affect our lives nowadays. This is because the virus can spread the disease quickly and easily. In fact, it has caused many deaths due to the dangerous virus. The lethalness of the disease causes severe acute respiratory illness (SARS-CoV-2) (Joost, 2020).

Apart from this, the Covid-19 pandemic has hugely impacted on the Klang Valley spa and wellness industry, as many businesses were compelled to close in order to avoid large crowds in public places. Therefore, this has led to issues arising in areas such as work performance, leading to unemployment increment, and financial problems.

This study will concentrate on three objectives which are,
1) To determine the work performance that affects the spa and wellness industry in Klang Valley during the Covid-19 pandemic.
2) To determine the unemployment rate that affects the spa and wellness industry in Klang Valley during the Covid-19 pandemic.

3) To determine the financial performance that affects the spa and wellness industry in Klang Valley during the Covid-19 pandemic.
4)

Significance of the Study

Covid-19

The significance of the study shows more closely how Covid-19 has impacted the spa and wellness industry in Malaysia. In addition, due to the coronavirus pandemic, the landscape of the spa and wellness industry in Klang Valley has changed. For example, due to the situation at that time, customers were unable to get treatment as they were afraid of getting infected. Moreover, employees and employers who have operational problems with the spa cannot operate normally because they must comply with the new regulations and Movement Control Order (MCO) to avoid Covid-19.

Spa and Wellness Industry

The implementation of the MCO has momentarily paralyzed the country's economic sector and many industries and businesses have also been affected like the spa and wellness industry in Klang Valley. Entrepreneurs such as spa and wellness operators also receive temporary work orders when their businesses cannot operate normally. From the result of this study, then the assumption is that it is not easy for the spa and wellness industry's operator to run a business, especially in Klang Valley.

Government

The findings of this study will allow the government to implement covid cases in this world nowadays. This is to make sure people's health is being prioritized in times of pandemics. The government's role is to ensure the health of all citizens. Therefore, for customers who attend each spa, the government must make a campaign by ensuring that all employers comply with the standards of procedure (SOP) that have been set to prevent the spread of Covid-19.

Future Researcher

Future researchers are likely to explain the value of research to society, whether in terms of common human goals or in areas where the relationship between research and important themes of human civilization has so far seemed negligible. In addition, future researcher can utilize this research to better understand the influence of the pandemic Covid-19 on the Klang Valley's spa and wellness industry.

LITERATURE REVIEW

Work Performance

Covid-19 has wreaked havoc on the global economy, especially in the spa and wellness industry, which is based in Klang Valley. Employees are prohibited from working. Dealing with the consequences of Covid-19 on management and the workforce has become particularly challenging for companies and employees in this unpredictable environment. In addition, financial constraints, as well as interruptions to the operations of the spa and wellness industry, and lockdown conditions have caused mental breakdown among the workforces.

Depression is a frequent condition that affects a person's existential characteristics as well as their job life (Ivandic et al., 2017). One of the problems that companies and employees in all industries are required to address as a result of the Covid-19 pandemic, and which has lately been highlighted as a severe concern, is mental health, the effect of which has virtually been overlooked. With the layoffs, stakeholders in the spa and wellness industries have concerns on

their reliability in the present climate including wage payments, as well as expenses that must be paid when the wellness industry and spa is closed. Due to the detrimental impacts of locking, drastic measures may be used. Despite the fact that the condition is widespread, and its consequences are growing more prevalent, the economic impact of workplace depression remains unknown (Cotofan, Maria, et al. 2021). When employees have reduced working hours or are unemployed due to natural calamities or political causes, they get despondent.

Unemployment Opportunity

Employers of all kinds, large, medium, and small, are slashing wage and hourly rates, at least temporarily, because of the Covid-19 pandemic's income losses. In addition, more spa and wellness businesses in the country are expected to close due to their inability to operate in the aftermath of the Covid-19 pandemic. Furthermore, many businesses, especially in the spa and wellness industry, were forced to suspend their business until the government announced the reopening of this particular economic sector. However, during this period, many young people have lost the opportunity to find jobs, and even some employees were laid off. This is because when demand for an industry's products or services falls, it responds by cutting back on production, which necessitates a reduction in employees. But this situation with this unemployment or laying off employees can indirectly have a lot of impact on human beings due to the closure of the workplace which to ensure the safety of the public especially.

In addition, the spa and wellness factories also had to be closed and this indirectly caused the country's economy to suffer because the business premises were unable to operate as usual. Then, the country's economy is also failing because Covid -19 makes it difficult for existing businesses to operate to ensure that the pandemic can be well controlled. Therefore, due to that, this has led to an increase in unemployment where the expenses of a business have been overwhelming.

Financial Performance

The Covid-19 pandemic has had a major influence on the spa and wellness industry. The most challenging issue in the spa and wellness industry is money management. Whether a firm is just getting started, growing, or decreasing, the question is always the same: does it have enough money to pay employees' wages, pay bills, and save for the future? It is vital to have enough cash flow to pay wages and expenses, and owners and management must comprehend the company's present and future obligations. Covid-19 has exacerbated the problem by shutting down numerous of the company's businesses. The budget has been balanced, and wages and bills have been paid, by either cutting operational expenses or marketing and relying on additional revenue streams.

Apart from this, despite the government's valiant attempts to promote businesses and safeguard employment through job retention programmers, millions of people have lost their jobs across the country. In the meantime, many self-employed people are seeing their earnings decline. As a result, the majority of nations are taking immediate efforts to increase jobless minimum income benefits availability and generosity.

Research Hypothesis

The literature review highlights independent variables affected by the Covid-19 pandemic, such as work performance, unemployment rates, and financial performance. Therefore, based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1   There is a significant relationship between the impact of Covid-19 on the spa and wellness industry in Klang Valley and Covid-19 affects the work performance in the spa and wellness industry in Klang Valley.

H2   There is a significant relationship between the impact of Covid-19 on the spa and wellness industry in Klang Valley and Covid-19 affects the unemployment rates in the spa and wellness industry in Klang Valley.

H3   There is a significant relationship between the impact of Covid-19 on the spa and wellness industry in Klang Valley and Covid-19 affects the financial performance in the spa and wellness industry in Klang Valley.

Research Framework

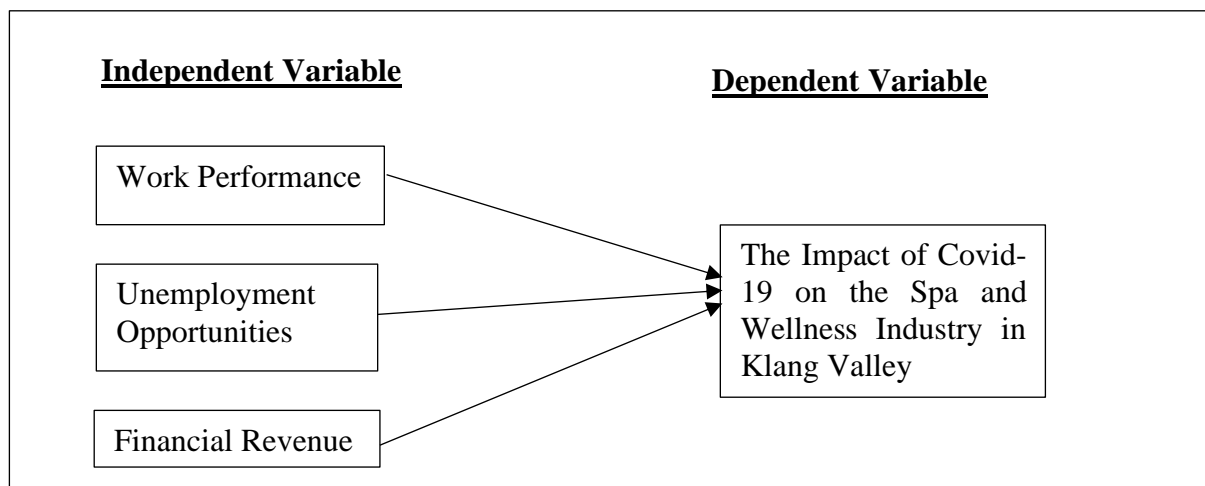
Figure 1 below shows the research framework used for this study.


Figure 1: Research Framework

Figure 1 shows the relationship between work performance, unemployment opportunities, financial revenue, and the impact of Covid-19 on the spa and wellness industry in Klang Valley in this research. The main objective of this research is to determine the impact of the Covid-19 pandemic on the spa and wellness industry in Klang Valley. The independent variables (IV) are work performance, unemployment opportunities, and financial revenue while the dependent variable (DV) is the impact of the Covid-19 pandemic on the spa and wellness industry in Klang Valley.

METHODOLOGY

Research Design

This research adopted quantitative method as a primary tool to collect the respondent's data standard criteria for the case study. The process of gathering and interpreting numerical data is referred to as quantitative research. In addition, this study will employ quantitative research, which is objective and formal research, as well as a statistical approach. The use of a large sample, measuring standards, deductive methodologies, and organized interview instruments to collect data to test hypotheses are all hallmarks of quantitative research. Furthermore, the target population for this study is 35 spas in Klang Valley.

Data Collection

In conducting research, there are numerous approaches for gathering data. The data for this study was gathered from primary sources. Primary data is taken directly from the source from which the statistics were derived, and it is considered the best type of data in research. The

questionnaire used in this study was created using Google Forms. The questionnaire is then distributed online, and collections of data were from respondents who work in the Klang Valley's spa and wellness industry. Because of the current challenges in Malaysia, which is the Coronavirus (Covid-19), the survey was done online.

Sampling

The sampling method is described as the selection of a subset of a population from which judgments or inferences about the whole population are made. In addition, the probability sampling technique will be used in this study. The term "probability sampling" refers to the fact that every member of the population has a chance to be chosen. It is largely utilized in quantitative research. Furthermore, the study used this method because the questionnaires were prepared and distributed online by posting them on social media pages to gather information from respondents. The questionnaire was distributed to respondents in the spa and wellness industry in the Klang Valley via Google Forms.

$$s = \frac{x^2 Np(1-P)}{e^2(N-1) + x^2 p(1-p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as a proportion (0.05)
$x2$ = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

This study will use three types of data analysis, namely descriptive analysis, reliability test, and Pearson correlation analysis. The data obtained were analysed using SPSS version 26.

FINDINGS

Descriptive Analysis

Descriptive analysis is a type of data analysis that helps to show, explain, and also summarize data points in a constructive way so that patterns that fulfil all of the data's requirements can develop. Table 1 shows the respondents' demographic profiles.

Table 1: Respondents' demographic profiles (n=32)

Demographic		Frequency	%
Age	25 – 34 years old	7	21.9
	35 – 44 years old	13	40.6
	45 – 54 years old	8	25.0
	55 – 64 years old	4	12.5
Gender	Male	10	31.3
	Female	22	68.8
Race	Malay	12	37.5
	Chinese	13	40.6
	Indian	1	3.1
	Other	6	18.8
Religion	Islam	12	37.5
	Buddhism	11	34.4
	Hinduism	1	3.1
	Christianity	5	15.6
	Others	3	9.4

Result of Reliability Analysis

In this study, this reliability test was conducted on 32 respondents (spa owners) aged between 25 to 64 years to check the reliability of the instrument. In addition, measurements using Cronbach's Alpha ensure the reliability of the instrument. Table 2 displays the reliable test results.

Table 2: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha
The Impact of Pandemic Covid-19 on The Spa and Wellness Industry in Klang Valley.	8	0.882
Work Performance	8	0.850
Unemployment Opportunities	8	0.918
Financial Revenue	8	0.932

Result of Pearson Correlation Analysis

Pearson's correlation coefficient is the statistic test that assesses the statistical link, or association, between two continuous variables. In this study, the researcher used correlation analysis to identify the relationship between the dependent variable and independent variables. Table 3 shows the Pearson Correlation result.

Table 3: Pearson Correlation Result

Hypothesis	P-Value	Result (Supported/Not Supported
H1 There is a significant relationship between the impact of Covid-19 on the spa and wellness industry in Klang Valley and Covid-19 affects the work performance in the spa and wellness industry in Klang Valley.	0.661	H1 is supported
H2 There is a significant relationship between the impact of Covid-19 on the spa and wellness industry in Klang Valley and Covid-19 affects the unemployment opportunities in the spa and wellness industry in Klang Valley.	0.815	H2 is supported
H3 There is a significant relationship between the impact of Covid-19 on the spa and wellness industry in Klang Valley and Covid-19 affects the financial revenue in the spa and wellness industry in Klang Valley.	0.660	H3 is supported

DISCUSSION AND RECOMMENDATION

The discussion is aimed at solving the problem and addressing the hypotheses mentioned in the first chapter of this study. This analysis of the literature hints on the impact of the Covid-19 pandemic on the Klang Valley spa and wellness industry. Targeted research identifies the impact of the pandemic.

According to Chapter 1, this study's first objective is to determine the work performance that affects the spa and wellness industry in Klang Valley during the Covid-19 pandemic. Based on

the data collected and exported in Chapter 4, there is a significant relationship between the impact of the Covid-19 pandemic on the spa and wellness industry in Klang Valley and the work performance of the spa and wellness industry in Klang Valley. The results of the relationship between the independent variable and the dependent variable indicate the reflection of H1. The majority of respondents agree that their work performance has been affected by the Covid-19 pandemic. Therefore, employee engagement is important during tough times. That is because employee engagement helps build strong positive attitudes toward work and the organization during difficult times.

The second research objective is to focus on determining whether the Covid-19 pandemic has impacted unemployment rates in the spa and wellness industry. The results of the data analysis in Chapter 4 show that the spa and wellness industry in the Klang Valley has a high level of motivation for unemployment opportunities. The results of the relationship between the independent variable and the dependent variable indicated the reflection of H2. The majority of the respondents truly agreed that unemployment is one of the results of the Covid-19 pandemic on the spa and wellness industry in Klang Valley. Therefore, both employees and companies profit from cutting hours rather than laying off workers. It allows employees to supplement their wages if hours are reduced.

The third objective is to identify the Covid-19 pandemic affects the financial revenue of the spa and wellness industry in the Klang Valley. According to the data analysis results in Chapter 4, the financial revenue of spa and wellness is very positive. It shows that H3 reflects the relationship between the independent variable and dependent variable. Most of the respondents agree that financial revenue is one of the effects of the Covid-19 pandemic on the spa and wellness industry in Klang Valley. Therefore, the spa and wellness industry can prepare for cash flow recovery plans such as finalizing orders, procuring materials, recalling employees, and receiving new shipments and operations.

Apart from this, there are two recommendations for this study. The first recommendation is the study site can be changed from the Klang Valley to Kelantan. This is because Kelantan is the closest state to the researchers. It will also make it easier for the researcher to communicate with the spa owners directly and be able to understand the impact of the Covid-19 pandemic more accurately on the spa and wellness industry.

The second recommendation is to change the existing data collection method to qualitative. After the study site is changed, future researchers not only can use questionnaires to collect data, but they can also use the qualitative method where future telephone surveys and face-to-face interviews. Specifically, face-to-face or telephone interviews allow a better understanding of the respondent's behaviour through the questions posed. Thus, it provides more honest, stable, and efficient information for research in knowing about the effects of the Covid-19 pandemic on the spa and wellness industry.

CONCLUSION

The purpose of this study is to determine the impact of the Covid-19 pandemic on the spa and wellness industry in the Klang Valley. In this study, work performance, unemployment opportunities, and financial revenue were impacted by the Covid 19 pandemic. As a result, the dependent variable in this study is the impact of pandemic Covid-19 on the spa and wellness Industry in Klang Valley while the independent variables are work performance, unemployment opportunities, and financial revenue.

The Pearson correlation coefficient was used to examine these independent and dependent variables. It shows that the independent variable has an influence on the dependent variable. The results showed a strong link between work performance, unemployment opportunities, and financial revenue. Overall, the findings of this study show that there is a link between work performance, unemployment opportunities, and financial income when it comes to the influence of the Covid-19 epidemic on the Klang Valley's spa and wellness business.

ABSTRACT

The study is about mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. Generally, health is physical, spiritual, and financial well-being, an important aspect of life. Mental health organizes the hedonic and eudaimonic perspective, which involves a person's well-being and productivity. This research explores the relationship between internal, external, and environmental factors toward mental health among students. The study mainly focused on quantitative descriptive analysis and selected probability sampling, the simple random method. 313 respondents participated in this study and distributed the questionnaire through Whatsapp. This study focused on mental health among students from form 1 to form 5 in SMK Tengku Panglima Raja. The results showed that the external factor, academic performance, and the internet led to mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.

Keywords: Mental health, Internal Factors, External Factors, and Environmental Factors

INTRODUCTION

WHO verified the Covid diagnosis on January 7, 2020, and Chinese officials classified coronavirus as the primary cause of this acute pneumonia (Secon and Abdullah 2020). Respiratory distress infections in humans are caused by Covid, an infectious illness prevalent in animals in the Wuhan market. Some research has been conducted to determine the primary cause of the sickness, which is bats (Li, 2020). Animal coronaviruses cause liver, gastrointestinal, and nervous system illnesses. However, comprehensive analyses have revealed that only seven coronaviruses are capable of causing people sickness (Tesini, 2020). SARS-CoV (severe acute respiratory syndrome) and the Middle East Respiratory Syndrome Coronavirus (MERS-CoV) were previously discovered as coronavirus that cause human illness, including mortality and respiratory infections. Both viruses have been linked to a significant outbreak of SARS and deadly pneumonia. The Middle East Respiratory Syndrome (MERS) was discovered in 2002 and 2012 (Tesini & WHO, 2020).

Mental illness can affect daily life, relationships, and physical health. This link, however, also works in the opposite direction. Personal experiences, personal relationships, and physical conditions are all factors that might contribute to mental health disorders. Taking care of one's mental health can help one's ability to appreciate life. People must balance their everyday activities, responsibilities, and efforts to increase their psychological resilience. Stress, depression, and anxiety can all affect a person's mental health and disrupt their daily routine. Many conditions can be classified as mental health, although the term is usually used.

The chapter explains the introduction of this research study. The purpose of this research study is to examine the factors that cause mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. This is because the Covid-19

pandemic causes a lot of mental health problems among students, especially secondary school students. Students' mental health problems during this Covid-19 pandemic have attracted researchers to study this topic. This chapter contains the background of the study, problem statement, research questions, research objectives, hypothesis, the significance of the study, definition of terms, and summary.

There were three objectives of this research:
1. To determine the relationship between internal factors and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.
2. To determine the relationship between external factors and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.
3. To determine the relationship between environmental factors and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.
4.

Significance of the Study

Secondary School Students

The finding of this study allows secondary school students to know the importance of academic stress that leads to mental health. It is vital to understand how secondary students' academic stress can affect their lives. Learning to control academic stress successfully can decrease anxiety and allow students to balance school and family. Reasonable changes in educational plans and other practical actions help increase the students' satisfaction. It also reduces the outcome of different stress factors and advances their mental health status. (Farahangiz, 2016).

Future Researcher

This research can be use to understand future mental health issues among secondary school students. Furthermore, other researchers may use this research in primary health education as a reference and guidance. Together with other academics, the data may be used for diverse demographics and areas of mental health difficulties. Similarly, it raises awareness and enhances Malaysian Quality of Life in terms of mental, particularly among students.

National Response

This study emphasized the complexity of maintaining mental health needs, especially for students. Because of that, it is crucial to capture the significance of collaborations between researchers, practitioners, families, and advocates, which enable instant access to the solution. Besides, the study provided information to the national response, such as funding for reliable information and helpline, access to personal protective equipment for the students, and raising the awareness of mental health services to the communication and access needs during the COVID-19 Pandemic.

LITERATURE REVIEW

Definition of Mental Health

Mental illness can affect daily life, relationships, and physical health. Personal experiences, personal relationships, and physical conditions are all factors that may contribute to mental health disorders. Maintaining one's mental health can help one's ability to appreciate life. Stress, depression, and anxiety can all affect a person's mental health and disrupt their daily routine. Although this term is commonly used, many conditions can be classified as mental health. (Adam, 2020).

A person's mental health is influenced by various social, psychological, and biological factors. For example, aggression and long-term financial stress are well-known dangers to mental health. Poor mental health is associated with rapid social transformation, stressful working conditions, gender discrimination, social marginalization, unhealthy lifestyles, poor physical health, and human rights abuses. People are more sensitive to mental health disorders due to different psychological and personality variables. Mental health promotion includes activities to improve psychological well-being. Mental illness and the broader concerns that support mental health should be addressed in national mental health policy. (World Health Day, 2017).

Internal Factors

Mental health is one of the issues faced by secondary school students during the Covid-19 pandemic. Mental health can happen quickly, which means that mental health happens with separate beginnings and ends. Mental health is an illness that keeps continued or long-lived (Prevention, 2021). Two internal factors that lead to mental health are academic stress and sleep deprivation. Academic stress is an internal factor that leads to mental stress among high school students. Research shows that academic stress reduces good health and the likelihood of increased anxiety or depression. An OECD survey report states that secondary students report they face higher levels of academic-related stress and lower well-being. The report must be measured mentally, socially, cognitively, and physically (Pascoe, 2019).

Longitudinal studies suggest that health-affecting sleep quality deficits can lead to mental health issues such as anxiety, depression, and stress (Wang, 2021). Youth is a time when students are at risk of sleep deprivation due to changes in biological rhythms. Lack of sleep can put students at better risk for mental health problems. Good sleep habits are important because inadequate sleep among students tends to decrease over time, and even short-term sleep issues can have a significantly impact on the onset of mental health problems (Milojevich, 2016).

External Factors

During the covid-19 outbreak, mental health issues among high school students have grown and have had a significant impact on their daily lives. This is because their emotions have been disturbed due to online learning. Some students are unfamiliar with online learning, which causes their feelings to be very disturbed. It was explained that several external factors, such as academic performance and internet problems, had contributed to their mental health problems. Learning conditions, especially during exams, assignments that must be submitted and increased workload in the classroom, can raise mental health issues among high school students. In addition, students want excellent results in academic achievement, and this fierce competition puts mental health problems on high school students to achieve their excellent results. Also, most high school students have high expectations of their academics. Due to the economic and digital divide, many students do not have access to online education due to a lack of either means or tools (UNESCO 2020).

Using interactive teaching methods accessible via the internet, teachers may pay more attention to student's individual needs and foster collaborative learning (Joyce, 2019). The COVID-19 outbreak has led to school closures around the world. Schools, colleges, and universities have moved their lessons and lectures online to ensure continuity of teaching and learning. This learning method is based on the advancement of information technology (IT) through internet technology, which has resulted in e-education or e-learning is defined as educational or learning activities through electronic media, especially internet networks (Al-Fraihat, 2020).

Environmental Factors

The COVID-19 pandemic has significantly impacted the lives and education of more than 1.6 billion children. Malaysia, like most other countries, implements a school closure policy. This means Malaysian students experience immediate learning loss for about a year or more. As a result of this issue, various environmental stressors and their effects on anxiety and depression were examined in this section. Social media is one of the factors influencing the mental health of students. During the outbreak, students were forced to stay at home and had to use social media to learn, communicate and obtain up-to-date information about the outbreak, which increased the amount of time and frequency of mobile social media use. The use of social media has been pushed to expand, possibly leading to the growth of problematic social media use and, consequently, endangering students' mental health. (Gao, 2020).

Some students reported increased psychological stress as a result of locking up. Students' expressions of stress, anxiety, loneliness, and depression were magnified during the COVID-19 crisis (Elmer, 2020). Children have missed out on critical academic and social achievement because they have dropped out of school. The possibility of their parents' jobs has been lost, adding to their concerns. Children may have to stay home with the abuser in the worst situations. Cabin fever is caused by being indoors for too long, and online learning has added to a teenager's depressed feelings. According to The Straits Times, he claimed he could never get away from his parents when they quarreled. Based on the above discussion, it is proven that environmental factors can affect mental health among students. Social media, restrictions and quarantine, and family circumstances are some environmental factors that have been discussed that have affected mental health (The Straits Times (2021).

Research Hypothesis

Literature review shows that independent variables such as internal factors, external factors, and environmental factors influence mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. Therefore, the study intends to 313 examine the degree of effect between these variables. Based on the literature discussed, the hypotheses of this study are summarized in the following manner:

H1	There is an association between internal factor towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19
H2	Pandemic.
	There is no association between internal factors towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.
H3	There is an association between external factors toward mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19
H4	Pandemic.
	There is no association between external factors toward mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.
H5	There is an association between environmental factor towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.
H6	There is no association between environmental factors towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic

Research Framework

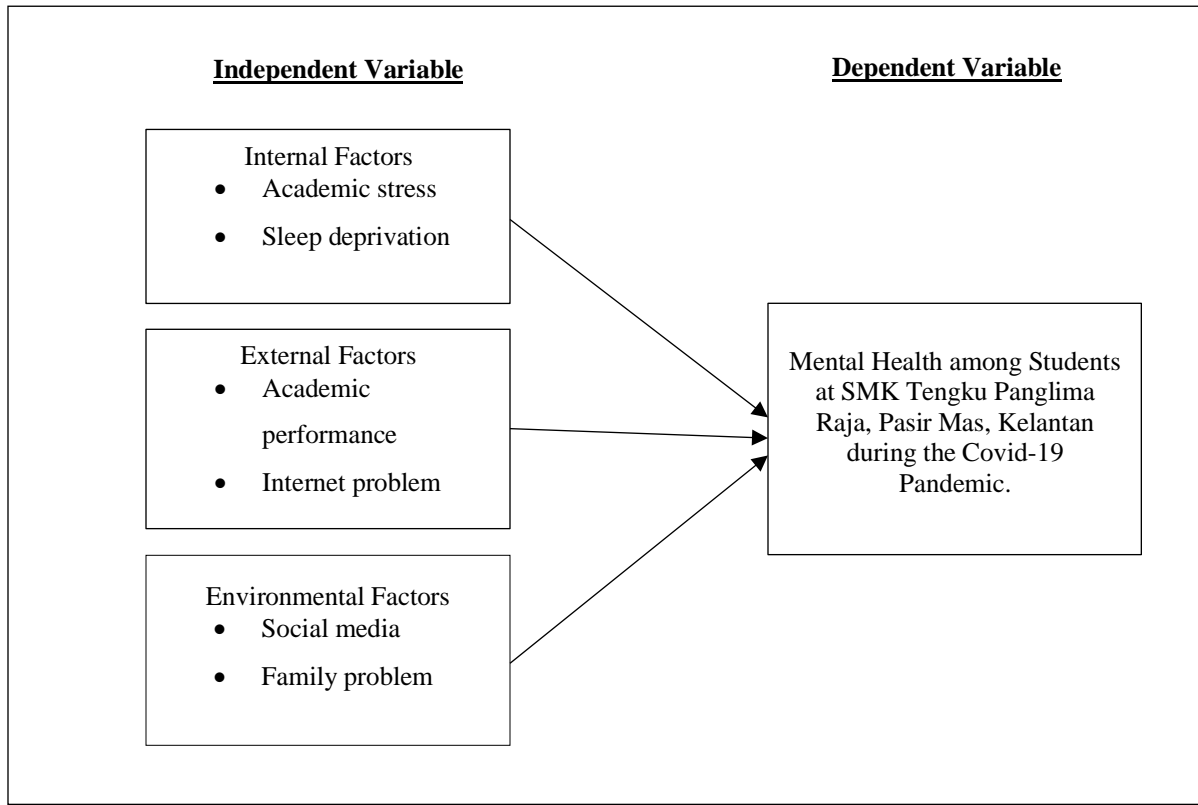
Figure 1 below shows the research framework used for this study to determine the internal, external, and environmental factors towards Mental Health among Students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.


Figure 1: Research Framework

METHODOLOGY

Research Design

This research used quantitative studies, which were objective and formal, and using statistical methods. Quantitative research is characterized by adopting significant sample measurement standards, a deductive approach, and structured interview tools for collecting data to test the hypothesis.

Therefore, a descriptive study was conducted to determine mental health among students of SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. Descriptive research assisted in representing features and current situations and drawing pictures of topics. In contrast, the descriptive study determined the answers to what, who, where, when, and how a situation or issue is selected. The approach chosen was based on a questionnaire using a three-point Likert scale. In this research, a surveys of research strategies were enforced.

Data Collection

In this data collection, the researchers applied both methods. In other words, the researchers' approach was designed by combining both qualitative and quantitative methods. For qualitative data, the researchers adopted the existing data from research journals, newspapers, website articles, and NGO reports. That method had high accuracy and easy access to information for researchers. Besides, the researchers approached the questionnaires for the quantitative method to the respondents. The researchers created- the online form by using Google Form to help the

researchers to collect the information quickly. This method made it easy to visualize and analyse, but it is also cost-effective and suitable to use during the COVID-19 pandemic as we need to practice a social distancing.

Sampling

Sampling is a technique that allows researchers to infer information about a community from the results of a subset of the population without looking into every person. It is also known as the selection of a subset of the people from which a generalization or inference about the entire population is produced. Each of these main categories has a different number of sampling strategies. The researchers used either a probability or a random sampling strategy in this study.
Data Analysis
Four types of data analysis were used in this study: frequency analysis, descriptive analysis, reliability test, and Pearson correlation analysis. The data obtained were analysed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the results of frequency analysis of this research.

Table 1: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	152	48.6
Female	161	51.4
Age		
13 years old	25	8.0
14 years old	29	9.3
15 years old	56	17.9
16 years old	47	15.0
17 years old	156	49.8
Race		
Malay	285	91.1
Chinese	13	4.2
Indian	11	3.5
Others	4	1.3
Religion		
Islam	287	91.7
Buddha	12	3.8
Hindu	10	3.2
Others	4	1.6

Table 1 shows the frequency analysis for demographic sections. The total number of male gender respondents is 152, while the number of female respondents is 161 respondents. Out of the 313 respondents, 48.6 percent of the total respondents were male, while 51.4 percent were female respondents who participated in this study. Secondly, for age, there are five age groups based on the chart above, which consist of 313 respondents in total. The study found that the majority of respondents who answered the questionnaire were 17 years old, composed of 156 respondents with a value of 49.8 percent, followed by 15 years comprised of 56 respondents

with a value of 17.9 percent. Next followed by 16 years comprised of 47 respondents with a value of 15 percent and followed by 14 years comprised of 29 respondents with a value of 9.3 percent. Finally, the 13 -year -old age group consisting of 25 respondents with a value of 8 percent answered the questionnaire. Thirdly, the frequency analysis for the race is that the highest number of respondents are Malays, 285 respondents with a value of 91.1 percent. The second highest is Chinese, which consists of 13 respondents with a value of 4.2 percent. Then, this is followed by Indians, which consists of 11 respondents with a value of 3.5 percent while 4 of them with a value of 1.3 percent from other races have answered the questionnaire.

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Mental Health	Often concerned about mental health in daily life.	2.40	0.799
	Experienced mental health problems such as stress, depression, and anxiety in studies.	2.23	0.749
	Feel worried about your studies during online classes.	2.34	0.742
	Do regular checks up occur during mental health problems.	2.05	0.716
	Do activities to avoid stress.	2.18	0.779
	Online learning cause mental health problems among students.	2.22	0.738
	Do healthy activities every week?	2.16	0.771
	Students with mental health problems, lose happiness in their lives.	2.15	0.764
	Students would be a shamed if had a mental health.	2.27	0.756
	Student faced mental health problem will not focus in their studies.	2.21	0.750
Internal Factor	Academic-related stress leads to mental health problems among students.	2.60	0.607
	Academic-related stress negatively impacts the quality of students' life and well-being.	2.55	0.587
	Does online classes during the Covid-19 pandemic cause excessive academic-related stress?	2.58	0.605
	Does the excessive level of tasks such as assignments, tutorials, presentations, and exams cause mental health?	2.59	0.609
	Does academic stress increase the generality of physical and mental issues that influence the students' educational achievement?	2.59	0.582
	Often face the habit of lack of sleep.	2.55	0.608
	Does this sleep deprivation problem occur daily?	2.38	0.712
	Does sleep deprivation cause mental health?	2.53	0.650

	Statement	Mean	SD
	Often concerned about sleep problems that occur.	2.54	0.645
	Sleep deprivation problems can lead to emotional imbalance and the development of mental illnesses for a long time.	2.66	0.556
External	Whether social media is one of the factors influencing mental health among students.	2.65	0.591
	Often use social media to get information.	2.61	0.567
	Is social media important for delivering health information to a global audience?	2.68	0.525
	Frequent use of social media will endanger the mental health of students.	2.52	0.641
	Are family problems a cause to student stress?	2.58	0.595
	Working parents are the root cause of family problems.	2.41	0.706
	Environmental factors can affect mental health among students.	2.63	0.541
	The advancement of social media that spreads false information will disrupt family problems.	2.59	0.570
	Family problems are influenced by social media.	2.37	0.696
	Whether family problems can be overcome when the use of social media is reduced.	2.52	0.594
Environmental factor	Whether social media is one of the factors influencing mental health among students.	2.65	0.591
	Often use social media to get information.	2.61	0.567
	Is social media important for delivering health information to a global audience?	2.68	0.525
	Frequent use of social media will endanger the mental health of students.	2.52	0.641
	Are family problems a cause of student stress?	2.58	0.595
	Working parents are the root cause of family problems.	2.41	0.706
	Environmental factors can affect mental health among students.	2.63	0.541
	The advancement of social media that spreads false information will disrupt family problems.	2.59	0.570
	Family problems are influenced by social media.	2.37	0.696
	Whether family problems can be overcome when the use of social media is reduced.	2.52	0.595

Table 2 shows the mean and the standard deviation for 30 statements under three independent variables and 10 statements from dependent variables based on the survey involving 313 respondents for the dependent variable. Most of the respondents selected to agree with question number 1, "Often concerned about mental health in daily life." Therefore, this question's high mean value was 2.40, and the standard deviation at 0.799. Question 4, "do regular checkup occur during mental health problems" had the lowest mean value (2.05) and the standard deviation at 0.716. Next, most respondents agreed with question number 10 on the internal factor: "sleep deprivation problems

can lead to emotional imbalance and the development of mental illnesses for a long time." So, it gets a higher mean value of 2.66 with a standard deviation of 0.556. Question 7 "does this sleep deprivation problem occur daily" showed the lowest mean value which was 2.38 with a standard deviation of 0.712.

Furthermore, the higher mean value for the external factor was item 3 which was 2.68, and the standard is 0.525. The respondent agreed, "Is social media important for delivering health information to a global audience." The lowest mean value was 2.37, with a standard deviation of 0.696, "Family problems are influenced by social media" in item 9. The item in the environmental factor "is social media important for delivering health information to a global audience?" has the highest mean of 2.68 (0.525 standard deviation). The item "working parents are the cause of family problems" had a mean of 2.41 (0.706 standard deviation). The last item, "social media influence family problems," had the lowest mean of 2.37 (0.696 standard deviation).

Result of Reliability Analysis
Table 4 below shows the result of the reliability analysis of this research.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Mental health	10	0.643
Internal Factor	10	0.802
External Factor	10	0.783
Environmental factor	10	0.735

Table 3 shows the reliability test. The reliability test for mental health, Cronbach's Alpha, showed a value of 0.643. In a reliability test for internal factors, Cronbach's Alpha obtained a value of 0.802. Meanwhile, the reliability test for the Cronbach's Alpha external factor showed a value of 0.783. As for the environmental factor reliability test, Cronbach's Alpha obtained a value of 0.735. This Cronbach's Alpha value shows results from 0.643 to 0.802. HR-Guide, LLC (2018) should recognize the Cronbach's Alpha value. If the alpha value is below 0.50, it is unacceptable if the value of 0.60 and above is normal. Whereas, if the alpha value of 0.70 is more than normal, 0.80 is a good value and 0.90 is better. Questionnaires can be used for analysis.

Result of Pearson Correlation Analysis
Table 5 below shows the correlation analysis of this research.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H_1: There is an association between internal factor towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. H_0: There is no association between internal factors towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.	-0.019	H1 is not supported

H$_2$: There is an association between external factors toward mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. **H$_0$: There is no association between external factors toward mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.**	0.032	H2 is supported
H3: There is an association between environmental factors towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. **H$_0$: There is no association between environmental factors towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.**	-0.016	H3 is not supported

Table 4 shows the Pearson Correlation Coefficient indicated the relationship between internal factors, external factors, and environmental factors towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. The significant value, the p-value was 0.741anf the Pearson Correlation was -0.019, shows that there was a very weak negative correlation between the internal factor and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. Next was the Pearson Correlation for external factors shows a p-value has 0.576. This proved no significant relationship between external factors and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid -19 Pandemic. The correlation coefficient of .032 suggested a weak positive correlation between external factors and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. The Pearson Correlation Coefficient, significant value, and the number of cases were 313.

Thirdly, the Pearson Correlation for environmental factors shows that The p-value is 0.774. This proves no significant relationship between environmental factors and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid -19 Pandemic. The correlation coefficient is -0.016, showing a very weak negative correlation between environmental factors and mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic.

DISCUSSION AND RECOMMENDATION

This literature analysis implies Mental Health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. The research objectives are to determine the relationship between internal factors, external factors, and environmental factors towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas, Kelantan during the Covid-19 Pandemic. From the findings that researchers get from the SPSS, the internal factor, academic stress and sleep deprivation, do not support the literature review in this research. This is because, COVID-19 was connected to one other for example, judgments of disease severity

correlated with the frequency of engaging in risk management actions but were unrelated to academic stress (Clabaugh A, Duque JF and Fields LJ,2021).

Next, the second research objective's findings show that mental health can also affect the academic of SMK Tengku Panglima Raja students. Furthermore, the academic performance of secondary school students has deteriorated due to lack of sleep, stress on homework, environment, and many more. If secondary school students receive too much pressure from the assignment given, it also harms the body's health and mental health, such as back pain, stress, and other physical pain. According to research, a lack of motivation and self-regulation abilities in online learning may result in individuals spending more time completing tasks, submitting late assignments, or producing poor-quality work overall (Albelbisi & Yasop, 2019).

Social media is one of the factors influencing the mental health of students. As we know, people can use social media to get information, discuss ideas and connect with others who are experiencing similar problems. It can also be a valuable platform for delivering information immediately during national or global crises (Gao, 2020). Expressions of stress, anxiety, loneliness, and depression among students are magnified during the COVID-19 crisis, according to Elmer (2020). Lack of friendships can lead to depression, anxiety, and severe stress can lead to anxiety. Children have missed out on critical academic and social achievement as they have dropped out of school. Their parents' jobs have been lost, adding to their anxiety. Children may be forced to stay home with abusers in the worst situations (According to The Straits Times (2021).

According to the preceding chapter, certain elements influence student mental health. Consequently, some recommendations for future research to improve the study was made. The first guideline is for secondary school students impacted by their hormones, surroundings, and daily routine. Secondly, the sample size could be widened in future research to emphasize the topic of mental health among students. Furthermore, the researcher also can expand the study area from secondary school to high school students. This proposal could provide a double advantage for new research to refine studies on mental health among secondary school students.

CONCLUSION

In conclusion, this study indicated students' mental health problems at SMK Tengku Panglima Raja, Pasir Mas Kelantan. Three independent variables, namely internal factor, external factor, and environmental factor, were selected to study mental health problems with dependent variables, namely mental health among students at SMK Tengku Panglima Raja Pasir Mas Kelantan during the Covid 19 Pandemic. A total of 313 respondents aged 13 to 17 were selected from the school to study mental health problems among students during the Covid 19 pandemic. There is only one hypothesis supported in this study. It is the external factor towards mental health among students at SMK Tengku Panglima Raja, Pasir Mas Kelantan, during the COVID-19 pandemic. Therefore, the second objective in this study is achieved.

The Effects of Dietary Supplements Intake on Health Among University Malaysia Kelantan Students in UMK City Campus

Muhammad Nur Hafizan, Aini Sakinah, Nasma Wani, Nur Ayuni, & *Hasif Rafidee Bin Hasbollah

Faculty of hospitality, tourism and wellness, university Malaysia Kelantan

Corresponding email: rafidee@umk.edu.my

ABSTRACT

Dietary refers to the types and amounts of food that an individual consumes to have an adequate supply of nutrients, such as fibre, which is a necessary supplement for adults. Supplements are food supplements that are frequently mistaken as a substitute for a daily diet based on individual perceptions. They can take the shape of liquids, pills, capsules, tablets, or food, and they can also take the form of vitamins, minerals, herbs, other plants, or food components. Many different diets that have evolved over the years. Because of that, it has altered drastically. This entails a rise in the use of ultra-processed foods, which are often low in dietary fibre and result in an imbalanced diet that is less nutritious for adults, as well as a decrease in the intake of whole foods. Therefore, the surveys on dietary supplement intake's effects on students' health was carried out among University Malaysia Kelantan students in UMK City Campus. There were 357 participants in this study, which was conducted using a Google Form and distributed to students via social media platforms such as Facebook, Instagram, Telegram and WhatsApp. The findings revealed that supplement consumption, supplement types, and supplement quality have a role in determining the rate of supplement consumption in order to limit the quantity of intake and ensure that it is neither excessive nor inadequate for students without supervision.

Keyword: Dietary supplements, supplement consumption, supplement types, supplement quality, excessive, inadequate, students

INTRODUCTION

Nutritional health is encompassing the complete food supply and adequate nutrition. A reduction in the amount intake of fruits and vegetables leads to natural nutrient deficiencies, as opposed to widespread use of nutritional supplements. The rise of the preventative use of dietary supplements is being driven by an aging population and growing awareness of dietary health related disorders such as obesity and diabetes (Wieringa, 2017).

Dietary supplements are manufactured products that contain one or more vitamins, enzymes, amino acids or other ingredients such as fibers in the form of pills, capsules, tablets, powders or liquids. Consumers may not have comprehensive information on the prices and benefits of supplements, as well as the influence on nutritional quality and personal health (Schroeter, 2017). Well-known nutritional studies are difficult to implement and interpret for various reasons, that include self-reporting food intake. Despite on this insight, our dietary knowledge is very little especially among students in age 19 – 24 years old. Dietary supplements are intended to add auxiliary nutritional value to the diet when nutrient adequacy cannot be met from food intake alone (Homan, 2018).

Changes in the Malaysian diet, as well as changing sleep schedules, physical activity, lifestyle and environment, have led to an increase in the intake of dietary supplements. Compared to fifty years ago, students are more inclined on eating foods that contain insufficient nutrients

and vitamins. This causes them to rely more on supplements to get enough vitamins for a healthy body (Sobre, 2021).

This study aimed to investigates the effect of dietary supplement intake on health among University Malaysia Kelantan students in UMK City Campus. Specifically, this research examines the relationship between supplements consumption, type of supplement and supplement quality. The results of this research can assist students in the practice of supplementation properly. There are three objectives of this research:

1. To determine the relationship between supplement consumption and dietary supplement intake among students at University Malaysia Kelantan.
2. To determine the relationship between types of supplements and dietary supplement intake among students at University Malaysia Kelantan.
3. To determine relationship between supplement quality and dietary supplement intake among students at University Malaysia Kelantan.

Significance of the Study
Students

University of British Columbia students in Canada have been studying how supplement affect the liver and other organs. Taking an excessive supplement dose or combining supplement can be awfully hazardous. Abusing products that hold a risk for liver or kidney damage only increases the possibility of life-threatening organ failure.

Parents

Parents need enlightenment about the effect of dietary supplement intake on their children's health. This research can help parents to help their children more on which supplement is good or bad for their children health. There is also a real risk when children treating dietary supplement as sweets due to their taste.

Community

This study will provide many benefits to the community on health problems if they are fond of taking this supplement to replace the daily diet. This study can also cause them to be more concerned about the health of their body and be able to practice this supplement properly.

Government

The findings of this study enable the government to implement a regulation on dietary supplement intake and apply it to the Malaysian especially university students. The Ministry of Education in collaboration with the Ministry of Health, can hold seminars and camps on health including the dangers of taking supplements that are not needed by the body.

LITERATURE REVIEW
Supplement Quality in Dietary Supplement Intake on Health Among Students

Most students in are increasingly vulnerable due to social media factors. This group is more vulnerable because it follows current trends. Adults in the age range of 24 are due to improve health. Some vitamins and minerals may be required in greater quantities by students. Talk to your doctor or a dietician about changing your diet or taking a vitamin or mineral supplement such as calcium, vitamin D, vitamin 6 and vitamin B12 (Sobre, 2021).

Prevent Illness

Nutritional supplement can help students get more nutrients from their diet. They can be used to correct a deficiency like iron deficiency or lower the risk of hypertension, such as taking a lactase supplement if they are lactose intolerant. A balanced diet will provide them with all of the nutrients they require. High-protein supplement for example, can assist youngsters with delayed growth to catch up in terms of weight and height (Mary, 2021). Students need vitamins and minerals to maintain optimal health. If they eat and exercise appropriately, they will not need a supplement. Proper usage of supplement can help them avoid the undesirable effects and the toxicity that come with excessive use if they over-rely on them (Shereen, 2020).

Disadvantages of Supplement

Taking too many health supplements without consulting a doctor may lead to a lot of problems. Supplement can potentially have unfavourable interactions with some medications. Misusing any resource can be detrimental to their body's development (Warren, 2018). Vitamin D helps the body absorb calcium and eating enough of it is essential for good health. Students' bodies produce vitamin D when their skin is exposed to sunshine, but greater time spent indoors and sunblock has reduced the amount of vitamin D many students get through sun exposure (Kraft, 2019).

Supplement Consumption

Excessive Supplement Intake

Each of these supplements has its own total intake rate according to the quantity of nutrients required by the body. Each type of supplement and dosage that a person need is very different. Consumers will be more at risk of overdosing when the same ingredients are in multiple products (Moses, 2021). Although these supplement have many benefits for personal health, they can also cause various health problems if taken incorrectly by people who are not following a doctor's instructions (Medine et al., 2020).

Inadequate Supplement Intake

Lack of nutrients in the body of students is an improper eating habit. If they do not have enough nutrients from their daily eaters, they are encouraged to take supplement. However, if the body has enough nutrients, the lack of intake of these supplements will not have a negatively impact (Sogari, 2018). Students who take supplement can have a detrimental effect on their health. They should know a little about these supplements before taking them because not all are effective. In addition, supplements are also not healthy to take because it can affect the health of the individual (Penn et al., 2020).

Supplement Quality

Supplement Identity

The FDA has established good manufacturing practices (GMPs) that companies must follow to help ensure their supplements' identity, authenticity, strength, and compositions. These GMPs can prevent the addition of wrong ingredients that contain too much or too little of the right ingredients (O'Dwyer and Vegiraju., 2020). GMPs are the required practices for every product production company to comply with the guidelines recommended by the regulating agency that control the licensing of the manufacturer (Andrew KW, et al., 2017).

Safety and Risk

Many students nowadays take more than one vitamin or other supplement in their daily. Dietary supplement may also contain herbs, minerals or other botanicals such as amino acids. Some supplement can increase the risk of side effects such as can change the consumers response to anaesthesia if it involves a to surgical operation (Pence et al., 2021).

Types of Supplements

Vitamins and Mineral

Supplement have various types such as vitamins and minerals that play an essential role for several vital functions. There are four categories of macronutrients including fat -soluble vitamins, microminerals, and trace minerals that can benefit our body in different ways (Nall, 2019).

Non-vitamin and non-Mineral

Dietary supplement (DS) is a health product that aims to supplement the diet by containing on or more dietary ingredients. DS also consists of various types of ingredients such as herbs, meal supplement, other botanicals, amino acids, any products with plant content and alternative medicine (Kablan, 2021).

Research Hypothesis

H1   There is no relationship between supplement consumption and dietary supplement intake among students at University Malaysia Kelantan.

H2   There is no relationship between types of supplement and dietary supplement intake among students at University Malaysia Kelantan.

H3   There is no relationship between supplement quality and dietary supplement intake among students at University Malaysia Kelantan.

Research Framework

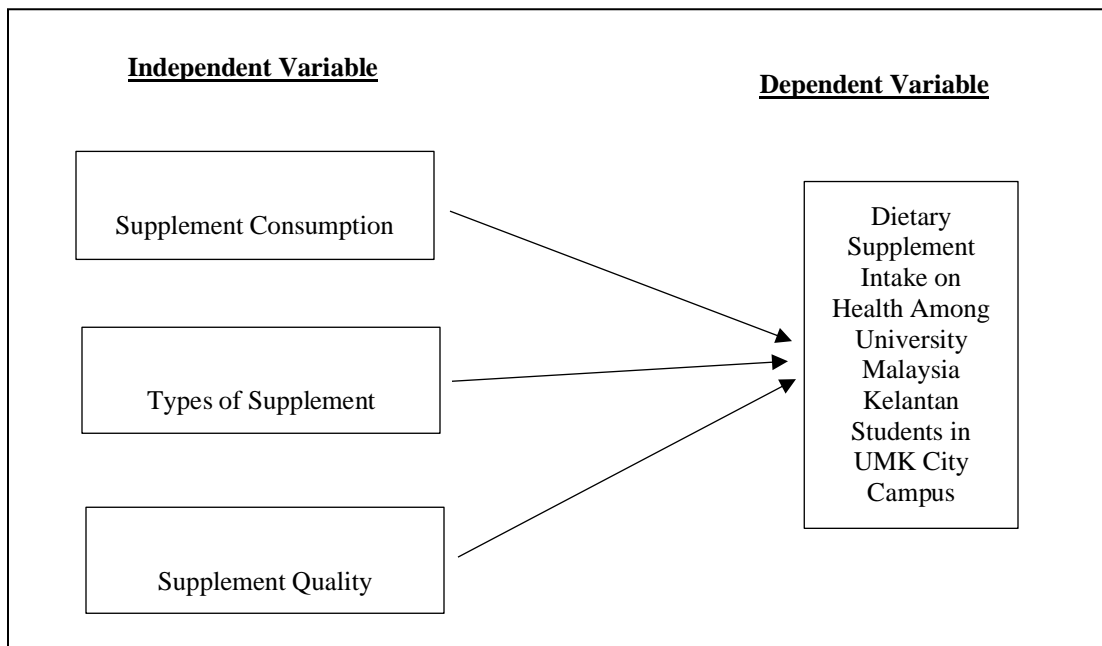
The main objectives of this research are to identify the effects of dietary supplements intake among University Malaysia Kelantan students in UMK, City Campus. Supplements consumption, types of supplements and supplements quality are the independent variables (IV), while dietary supplement intake is the dependent variable (DV).


Figure 2:Research Framework

METHODOLOGY

Research Design

In this study, researchers used quantitative methods to collect and analyze data to study the effects of dietary supplements on health among students at University Malaysia Kelantan (UMK). The process of collecting and analyzing numerical data is known as quantitative research. Quantitative research gathers data from current and potential consumers by employing sampling methods and sending out online surveys, polls, questionnaires and other forms of data collection. The results of which can be represented numerically. After careful understanding of these numbers to predict the future of a product or service and make changes accordingly (Bhandari, 2020).

Data Collection

Data collection is the professional approach to gathering and measuring the data from a grouping of sources in order to get a comprehensive and precise information. Data collection empowers a person or an association to reply to related questions, assess comes about and make guesses with respect to up-and-coming probabilities and patterns.

Google Form survey is reasonable in this study. Google form is simpler to reach the respondents in UMK City Campus due to the fast development of social media. The Google form is divided into three parts: Part A, Part B, and Part C. Part A discusses about demographic segmentation. Demographics refers to particular population characteristics such as gender, age, race and years of study in UMK and faculty. Part B is about the variables proposed in the research. It focuses on all independent variables provided in the study such as supplement consumption, types of supplement and supplement quality. Part C discussed the dependent variable which is dietary supplements intake among UMK Students in UMK City Campus.

Sampling Method

Sampling is the strategy of choosing sufficient sums of basics from the population. A study of the sample and understanding of its properties or depiction is able for the research to be simplify the properties or highlights of the population fundamentals. The reason of sampling is to supply

215

different sorts of measurable data of a quantitative nature around the full effect of dietary supplements by analyzing some selected respondents among University Malaysia Kelantan, City Campus (UMK) students. Simple random sampling was utilized in this study since random point of view from respondents were chosen within the populace as representative of FHPK students and FKP students instead of subjective evaluation. The number of respondents was around 5631 at the UMK, City Campus with 2149 understudies from FHPK and 3482 understudies from FKP. This research was conducted to examine the impact of dietary supplement intake on health among UMK students in city campus. Respondents with specific viable criteria, fast access, and area availability at the time or willingness to take an interest in the research.

Data Analysis

Data analysis is a process of collecting and organizing data. It occurs by systematically applying statistical and logical techniques used by researchers to evaluate data and reduce data to stories and interpret them to gain insights. The data analysis process helps reduce the bulk of the data into smaller particle, which makes sense. Data can be in two primary data types which are qualitative data and quantitative data (Calzon, 2021). Therefore, this study conducted a questionnaire to obtain test results and responses from respondents based in the data of this analysis. This study used Statistical Package for the Social Sciences (SPSS) method to analyze the data obtained. All results for each data which are commonly used in reports, and presentations are presented in various forms and methods such as graphs, tables, and pie charts (In, 2017).

This study chose university students from University Malaysia Kelantan (UMK) as the respondents in this study because of the factor that the researchers were also the students from UMK. The results of this research presented in the report explained the answer to the research question which was regarding the "effects of dietary supplements intake among university students in University Malaysia Kelantan. This made it easier for researchers to conduct the research.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the results of frequency analysis of this research

Table1: Frequency Analysis

No	Sociodemographic Characteristics	Frequency (n)	Percentage (%)
1	Gender	357	100
	Male	164	45.9
	Female	193	54.1
2	Age	357	100
	18-20 years old	44	12.3
	21-23 years old	246	68.9
	24-26 years old	54	15.1
	27 years old and above	13	3.6
3	Faculty	357	100
	FHPK	184	51.5
	FKP	71	19.9
	Other	102	28.6
4	Marital Status	357	100

	Single	324	90.8
	Married	28	7.8
	Other	5	1.4
5	Race	357	100
	Malay	320	89.6
	Chinese	19	5.3
	Indian	13	3.6
	Other	5	1.4
6	Religion	357	100
	Islam	327	91.6
	Hindu	12	3.4
	Buddha	6	1.7
	Other	12	3.4

A frequency analysis was used to summarise the background facts on the demographic profile of 357 respondents in Table 1. There were two groups of gender which were male and female. The findings revealed that the majority of males who answered the questions consisted of 45.9 % of the 357 survey respondents. In comparison, the group of females, includes 54.1 %. The majority of individuals who answered the questions were between the ages of 18 and 20, accounting for 12.3 % of the 357 survey respondents. Among University Malaysia Kelantan's students, 68.9 % are between the ages of 21 and 23, 15.1 % are between the ages of 24-26, and 3.6 % are between the ages of 27 and above. Faculty from FHPK made up more over half of the respondents, accounting for 51.5 %. Other faculty accounted for 28.6%, which was the second largest percentage. Finally, faculty from FKP was ranked third highest in percentage, 19.9 %. The data revealed that the majority of people who answered the questions, 90.8% of the 357 survey respondents, had not yet married. The second most significant percentage was 7.8% among married people, followed by 1.4%. Other races made up more than half of the respondents, accounting for 89.6%, which was Malay. The second-highest percentage was 5.3% was Chinese. The third-highest was Indian, with 3.6%. The other races made up the remaining 1.4% of respondents, respectively. Islam was the religion of 91.6% of respondents questioned. Hinduism was the second most popular religion, accounting for 3.4% of the total. Buddhism is the least popular religion, with only 1.7%, and other religion came in the third position with 3.4%.

Result of Descriptive Analysis

Table 2 below shows the result of descriptive analysis of this research.

Table 20: Descriptive Analysis

Variable	Item	Mean Score	Standard Deviation
Supplement Consumption	Are you smart in controlling the intake of supplements for your body?	4.06	1.001
	Did you study the ingredients used in the supplement before using it?	4.21	0.969
	Is this supplement suitable for all ages?	3.30	1.419
	Did you know that taking supplements can cause adverse effects in the future?	4.32	0.944

	Do you think taking excessive supplements can harm our body?	4.56	0.749
	Do people with poor health need to take any supplements?	3.76	1.169
	Does taking this supplement have more advantages than disadvantages?	3.76	1.097
	Does a person need to take supplements even if his body is healthy and well?	3.50	1.323
Types of Supplements	I know the types of vitamin and mineral dietary supplements that I use.	4.24	0.868
	Vitamin and mineral dietary supplements can make up for an unhealthy diet.	4.05	0.971
	I'm aware that taking vitamin and mineral supplements in excess will cause health problems.	4.19	1.013
	I choose vitamin and mineral supplements according to the body's needs so that it will not bring harm to myself.	4.35	0.805
	I know the types of non-vitamin and non-mineral dietary supplements that I use.	4.03	0.941
	I use non-vitamin and non-mineral supplements to increase energy, beauty, promote weight loss, and improve athletic performance.	3.61	1.272
	I am aware that excessive consumption of non-vitamin and non-mineral supplements can have an impact on my health.	4.35	0.830
	I take non-vitamin and non-mineral supplements because I don't have time for sports because I'm busy with assignments and want a short cut.	3.66	1.300
Supplement Quality	I take supplements as my daily routine because of the influence of people around me.	3.37	1.429
	I am always taking note of the suggested use and serving size, supplement facts, % daily value, expiration date and cautions and warnings written on the supplement labels when buying it.	4.15	0.994
	I prefer to take foods like fruits, nuts, soy etc as my supplements rather than capsule, tablet or powder supplements.	4.19	0.970

	I know the amount of intake/quantity of supplements needed for my age.	4.09	0.924
	I like to take supplements more than 2 times a day because it tastes good.	3.15	1.516
	I always buy supplements in large quantities from various brands in one time.	3.03	1.580
	I acknowledge that taking excessive supplements will harm my body.	4.42	0.846
	My body is healthy enough without having to take supplements as a dietary supplement.	3.93	1.109
Dietary Supplement Intake on Health Among University Malaysia Kelantan Students in UMK City Campus	Do you know what dietary supplement?	1.12	0.326
	Have you taken a diet supplement?	1.58	0.494

Table 2 shows the mean and standard deviation for 26 statements under three independent variables under the dependent variable based on the survey involving 357 respondents. The highest mean value for the effects of supplement consumption was obtained by Question 5 with 4.56, where the respondents agreed that taking excessive supplements can harm the body. The lowest mean value belongs to Question 2 with 3.30, where the respondents agreed that the supplement is suitable for all ages. As for types of supplements, the highest mean value was obtained by Question 7 with 4.35. The respondents agreed that excessive consumption of non-vitamin and non-mineral supplements could impact health. The lowest mean value belongs to Question 6, with 3.61. The respondents agreed that they use non-vitamin and non-mineral supplements to increase energy, beauty, promote weight loss, and improve athletic performance. Meanwhile, the highest mean value for the supplement quality was obtained by Question 7 with 4.42, where the respondents agreed and they acknowledged that taking excessive supplements will harm the body. The lowest mean value belongs to Question 6 with 3.03, where the respondents agreed that they always buy supplements in large quantities from various brands simultaneously. Next, the highest mean value for the dependent variable of dietary supplement intake on health among UMK students was obtained by Question 2 with 1.58, where the respondents agreed that they had taken a diet supplement. The lowest mean value belongs to question 1 with 1.12, where the respondents agreed that they know what dietary supplement is.

Result of Reliability Analysis

The Table 4 below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of Item	Cronbach Alpha
Supplement Consumption	8	0.77
Types of Supplements	8	0.81

Supplement Quality	8	0.80
Dietary Supplement Intake on Health Among University Malaysia Kelantan Students in UMK City Campus	2	0.44

The result of the reliability analysis is shown in table 3 above. The reliability for the supplement's consumption shown is strong. The alpha coefficient of Cronbach's is 0.77. The reliability for the types of supplements shown is strong. The alpha coefficient of Cronbach's is 0.81. Meanwhile, the reliability for the supplement's quality shown on the 4.3.3 scale is strong. The alpha coefficient of Cronbach's is 0.80. The reliability for the dependent variable, the dietary supplement intake on health among University Malaysia Kelantan students shown on the 4.3.2 scale, is strong. The alpha coefficient of Cronbach's is 0.44. As a result, the questionnaire is trustworthy and consistent, and it can be utilized in the study.

 Result of Pearson Correlation Analysis

The Table 5 below shows the result of correlation analysis of this research.

Table 421: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
Ha1: There is a relationship between supplements consumption and dietary supplements intake among students in University Malaysia Kelantan.	-0.189	H1 is not supported
Ha2: There is a relationship between types of supplements and dietary supplements intake among students in University Malaysia Kelantan.	-0.152	H2 is not supported
Ha3: There is a relationship between supplement quality and dietary supplements intake among students in University Malaysia Kelantan.	-0.126	H3 is not supported

According to table 4 above, there was no relationship between supplement consumption and dietary supplement intake among students at University Malaysia Kelantan because the p-value is -0.189. Therefore. H1 was not supported. Second, there was no relationship between the types of supplement and dietary supplements intake among students in University Malaysia Kelantan because the p-value was -0.152. Therefore, H2 was not supported. Third, there was no relationship between supplement quality and dietary supplement intake among students at University Malaysia Kelantan because the p-value was -0.126. Therefore, H3 was not supported.

DISCUSSION AND RECOMMENDATIONS

According to the findings, supplement intake of vitamins and minerals has a strong influence on students' decision to continue taking supplements to boost their body's immunity by consuming vitamin C, vitamin D, and other nutrients in the proper amounts. Most respondents were satisfied with the types of supplements based on the descriptive data for all independent variables, which was more significant that the data for other variables, which was 4.06. most UMK students are aware of the various vitamins and minerals they utilize, and these supplements can also be used to substitute for unhealthy diets. Next, based on the independent variable, value for supplement consumption and dependent variable, dietary supplement intake on health, has no relationship. This is because they agreed that supplements had more advantages. Therefore, they preferred to consume supplements in the right quantity of 75-90 mg daily for both males and females.

Several effects of dietary supplement intake on health among university Malaysia Kelantan students are discussed in the previous chapter. As a result, there are several areas where additional research should be conducted. Moreover, Researchers can expand the scope of the study from University Malaysia Kelantan to external university such as University Malaysia Terengganu, UITM, or other universities in Malaysia where students may have used dietary supplements as their food supplements, which can also increase the number of respondents and improve existing results. Comparing places of study in various University can also increase the number of questions in each field. This is because the respondents that were only taken from University Malaysia Kelantan Students in UMK City Campus.

Next, in terms of research methodology, a quantitative approach can be used to obtain more accurate information to achieve research results. Researchers can also devise methods to analyze the effects of dietary supplement intake on health, making research more valuable for researchers. Studies conducted for specific long -term studies to measure the effects of supplement use on health, especially among university students, are highly appreciated in terms of methodology.

CONCLUSION

In conclusion, this study was conducted to examine the effect of dietary supplement intake on health among students of University Malaysia Kelantan for Kota campus. Three independent variables, which is supplements consumption, type of supplement and supplement quality were selected to study the relationship with the dependent variable, i.e., dietary supplement intake among students on the city campus. A total of 357 respondents were selected among them to help us complete the study conducted. However, the data above shows that the hypothesis has not supported all variables because almost all respondents agreed that excessive intake of supplements has negative effects and will harm the body. However, they also agreed that supplements have multiple functions according to the types of vitamins, and it is good for the body to increase the body's immune system. Therefore, supplement intake among students is vital.

The Impact of Covid-19 on Mental Health of Undergraduate Students in UMK Year 3

Aufa Nabila Binti Amirudin, Mohamad Hafizi Bin Hassan, Noredah Seradi, Wan Nurul Balqis Binti Wan Abd Aziz & *Hasif Rafidee Bin Hasbollah

Faculty of Hospitality, Tourism and Wellness, of University Malaysia Kelantan

Corresponding email: rafidee@umk.edu.my

ABSTRACT

Mental health deterioration among university students was a significant public health problem worldwide during the COVID-19 era. One of the major concerns throughout online learning is students' mental health. Students are likely to be more stressed due to of the change to online learning. The common causes of mental health problems among university students are due to several factors, such as internal, external, and environmental factors. A qualitative study was conducted to identify the impact of COVID-19 on the mental health of undergraduate students. In-depth interviews have been conducted with 8 respondents. The data obtained were analysed using a content analysis method. The findings of the study showed that undergraduate students in UMK year 3 suffered from mental health problems due to internal, external, and environmental factors. This research's findings also indicated that undergraduate students in UMK year 3 were aware of mental health problems.

Keywords: Mental Health, COVID-19, Internal, External and Environmental Factors, Undergraduate Students

INTRODUCTION

Mental health deterioration among university students was a significant public health problem worldwide during the COVID-19 era. Mental health is considered one of the hottest topics in the world today. These conditions have also become the most powerful tremors in the world due to many factors influencing them. Many types of mental health are categorized by the World Health Organization (Felman, 2020).

In addition, according to the World Health Organization, mental health is a state of well-being in which one can recognize one's abilities, master typical life challenges, work efficiently and contribute to the community. These conditions entail more than the absence of mental illnesses or disabilities, and maintaining optimum mental health entails avoiding active illnesses and maintaining overall wellness and enjoyment. This situation has affected many employees, industry, and students, impacted by the changing environment, new system, and other issues.

This study consists of three objectives:
1. To explore the internal factors that impact the mental health of undergraduate students in UMK year 3 during COVID-19.
2. To explore the external factors that impact the mental health of undergraduate students in UMK year 3 during COVID-19.
3. To explore the environmental factors that impact the mental health of undergraduate students in UMK year 3 during COVID-19.

Significance of the Study

Undergraduate Students

An undergraduate student works for a bachelor's degree, often referred to as a bachelor's degree. Undergraduate students will research a wide range of topics, effectively embarking on any subject studied or taught at university in the first stage of university studies. Undergraduate students who faced mental health problems while studying at the undergraduate level increased during the Covid-19 pandemic.

University

Universities are institutions of higher learning and research that award academic degrees in a number of academic disciplines. A higher-level educational institution where research is done can help universities predict the mental problems students face. This study can help the university provide a suitable curriculum for these students.

Nation

A nation is a community of people formed on the basis of a combination of common characteristics such as language, history, ethnicity, culture, and region. It is also a large group of people united by the same lineage, history, culture, or language, inhabiting a particular country or region. Undergraduate students who face mental health problems in the Covid-19 pandemic are Malays, Chinese, Indians and other ethnicities.

LITERATURE REVIEW

Internal Factors

Stress

Stress is our frame's reaction to pressure. Many extraordinary conditions or lifestyles activities can purpose pressure. It is regularly brought on whilst we revel in something new, surprising or that threatens our experience of self, or whilst we experience, we have little manipulate over a situation. We all address pressure differently. Our capacity to manage depends upon our genetics, formative year activities, character and social and monetary circumstances. When we come upon pressure, our frame produces pressure hormones that cause a combat or flight reaction and spark our immune system. This enables us to reply quick to risky conditions.

People have long believed that a student's body is less susceptible to pressure or problem. Today, stress is understood as a lifestyle disaster that affects all characters, regardless of their developmental stage. The stress response can be measured by self-documentation, behavioral coding, or physiological measurements. These responses consist of emotional, cognitive, behavioral, and physiological responses caused by demanding stimuli. One of the most straightforward approaches to assessing stress response is identifying the perceived stress associated with a particular stressor or person's situation. Responses to acute stressors have been historically studied in a controlled laboratory environment with the aim of detecting responses that spread within minutes of stressor exposure (Crosswell & Lockwood, 2020).

Migraine

Migraine is a neurological disorder recognized as the leading cause of the inability to work worldwide, affecting an estimated 1 in 10 and 1 in 6 people worldwide. Although there have been many popular studies on migraine in recent years, there are still international locations with few statistics on migraine exposure, especially in the Asia-Pacific region (Haw et al., 2020).

Migraine sufferers constantly file poorer high-satisfactory of existence rankings than wholesome people on factors of bodily well-being. Meanwhile, continual migraine sufferers constantly file poorer high-satisfactory of existence rankings than episodic migraine sufferers on factors of emotional well-being. Additionally, the expectancy of fear on the following migraine assault is in itself negatively affects the painting's productiveness and high satisfaction with existence (Haw et al., 2020).

External Factors
Financial Challenges

Financial challenges are also one of the determinants of university students' mental health. As with any over-demand, financial problems can have a major impact on intellectual and physical health, relationships, and universal living standards. Feeling depressed due to money concerns can affect the level of sleep, self-esteem, and physical fitness.

As we dig deeper into this matter, we all know that we are at risk more than money, but financial worries and tensions can dominate the world while people suffer. It can hurt your self-esteem, make you feel like you have failed, and fill you with despair. The greater the financial burden, the greater the sacrifice of mind, body and social existence.

Bundles of Assignment

There are too many tasks and the submission deadline is very short, which puts a strain on students studying online at home. This is because students also face the problem of loneliness to complete tasks, especially tasks performed in groups. Groups with problematic members, such as neglecting tasks, put a strain on other group members, making it difficult for them to complete the task. This is called the academic difficulty of students with problems. The academic difficulty, i.e. the ability to focus on academics and online learning, was also associated with high levels of all four measures of mental stress (Corey et al., 2020).

Due to a sudden COVID-19 outbreak and, consequently, a sudden shift to online learning, ordinary academics did not have adequate time to adjust to the new teaching platforms (Zhao et al., 2021). Long-term closure of educational institutions disrupts everyday school life, and family financial loss, lack of personal space at home, increased risk of infection for other families, and precarious work opportunities give students. It can have a variety of psychological effects (Morawska et al., 2020; Wang et al.,2020).

Environmental Factors
Unconducive Learning Environment

Students with mental health problems are due to certain factors, and one of them is an environmental factor, such as a less conducive environment. The less conducive situation, such as a narrow house, the state of the house is uncomfortable, there is no table to learn, and so on. Disruption is higher among undergraduate and graduate students who do not adapt well distant instructions. High disorders of students who cannot adapt well will affect students in various situations, and the possibility of students will experience depression. Major depression disorders and general emergency disorder rates are more pronounced among low-income students (Chirikov et al., 2020).
Out-of-control mental health affects everything, including the situation of students studying online at home. Proper mental health management can help and calm students in good learning situations. Indirectly, students' problems of depression and pressure can be alleviated and

controlled during their studies. Academic difficulties, such as the ability to concentrate on school, were significantly associated with increased levels of depression, anxiety, somatization, and stress. It is also important to note (Kecojevic et al., 2020).

Internet Connectivity

Environmental factors such as dysfunctional students that is, internet connections between students living in remote areas, are also factors that affect the mental health of students. Moving to online learning, especially on courses that were not originally designed for online care, can increase student stress. Some students may have difficulty accessing computers and the internet at home (Kecojevic et al., 2020).

Students facing online courses experience stress when they are unable to take online courses due to internet barriers. Therefore, this factor has a great impact on the mental health of students. Rural students struggled to deal with upgrade settings due to poor internet connectivity and computer access, putting an emotional burden on students (Khan and Abdou, 2020).

Research Framework

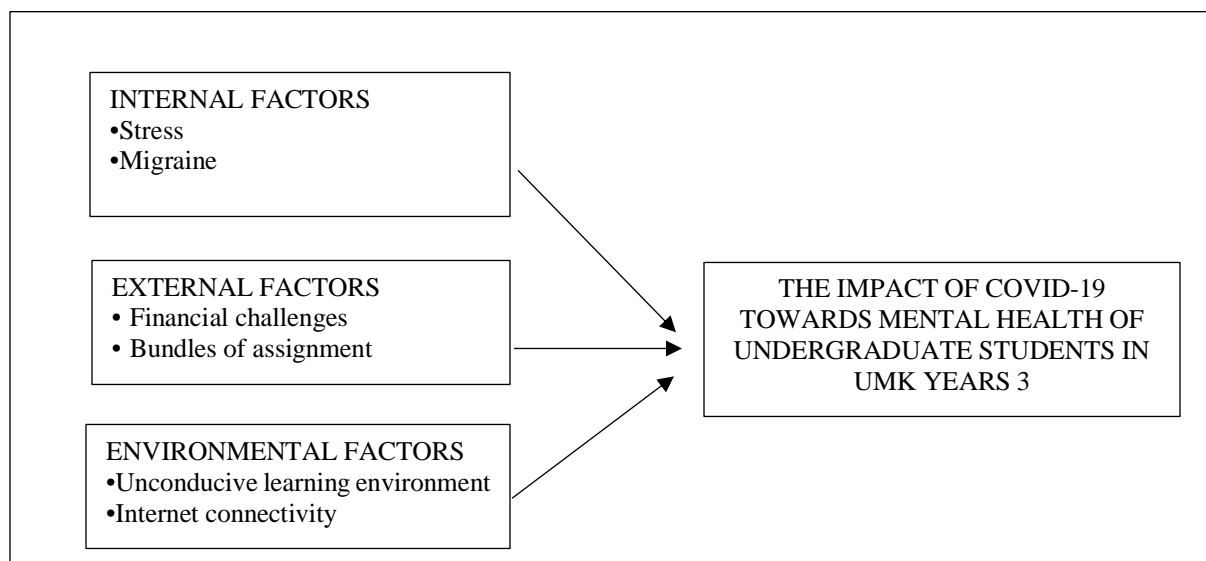
The Figure 1 below shows the research framework use for this study.


Figure 1: Research Framework

METHODOLOGY

Research Design

This research used qualitative data collection as a key strategy for gathering respondent data, which includes the utilization of multiple data sources such as interviews and observations. The interview questions were open-ended to provide participants the opportunity to fully express themselves (Gaudet & Robert, 2018). The audio recordings were coded and transcribed (Denscombe, 2017). Participants could leave the research any time they want, without adverse effects on their actions. Interviews were used to gather data for the study, which will then be examined. As the researchers used the qualitative method, data were collected through sampling in either a semi-structured or unstructured format (Creswell & Creswell, 2018).

Interview

In this study, the interview method was used for this research by getting respondents to this study. Due to the difficulties during this pandemic, many interviews were conducted online. This interview was conducted on the internet on 8 respondents.

Sampling

Snowball sampling is a unique non-possibility technique wherein current have a look at topics recruit destiny topics from amongst their buddies to broaden a study sample. The choice of particular facts reassesses from which facts are accumulated for the goals of the studies is primarily based totally on references from one supply to another. This sampling method is frequently utilised in hidden populations, that are tough to enter via way of means of researchers or in instances wherein the sampling body is tough to ascertain, and it assumed that instances affiliated through hyperlinks will be exploited to discover different respondents primarily based totally on current ones. Snowball sampling become utilised in that have a look at.

The purposive and snowball sampling technique was used to identify students with the mental health of student University Malaysia Kelantan year 3. This sampling has been used to achieve this research's aim objective and obtain data from the respondent. The student of Pengkalan Chepa university was selected for this study, with six respondents with mental health problems.

Data Analysis

The facts' evaluation system starts after the interviews and surveys are finished, and outcomes are obtained. Data were gathered through discipline notes, interview sessions, conversations, photos, videos, and memos to personalities. The maximum vital factor of the survey turned into that respondents knew in particular that records on their component popularity turned into being gathered. This observation turned into analysing the use of the Content Analysis technique primarily based totally on the studies goals, which can be internal, external and environmental factors. It is one of the maximum famous strategies used for qualitative studies. All the interview transcripts from the respondents were appropriately analysed to seize the experience of the complete data.

FINDINGS

Table 1 below shows the results of internal factors.

Table 122: Analysis of Internal Factors

Research Question	Respondent	Internal Factors
Since when do you have stress?	R1: Since the assignments given in the online lessons are too many R2: Since pursuing studies at the undergraduate level R3: I face stress at the start of every new semester R4: Ever since I started high school, I started to feel that I was facing stress in some problems R5: I face stress when I am forced to study R6: Stress during a lot of work, do not understand and nothing helps R7: When many assignments come suddenly and due dates are all close by R8: Usually I will experience stress when the home environment is noisy, and stress from a lot of assignments	Stress
What causes you to experience stress?	R1: Insufficient and poor-quality sleep, work stress and many tasks R2: When doing group work and there are group members who do not cooperate well to complete the assignment given by the lecturer. In addition, irregular sleep also causes me stress R3: When given a lot of assignments by the lecturer R4: My busy daily schedule. Because while in school I was a dancer so I had some competitions, performances so I had to have daily rehearsals and sometimes on holidays I also had rehearsals, because I	

	was also a student, I still had to do school work, extra classes and so on. So, I'm a little stressed. In addition, my lack of sleep is also one of the problems that make me stress R5: Too much pressure is applied at one time and never have a migraine R6: I often don't get enough sleep, causing me to always feel unmotivated in doing all the new work R7: Time constraints to complete the task R8: The main cause is neighbors who often make noise when classes are online and due dates of course work are nearby	
Since when do you have migraines?	R1: When I was in high school R2: Since form 5 R3: I get migraines when I think too much R5: When the time a lot of work in very short time R6: Since I started school R7: Since studying at university R8: 16 years old	Migraine
What causes you to have migraines?	R1: Because of stress and not enough sleep R2: Because of insufficient sleep and sleep late at night also too much drink caffeine to stay awake at night R3: Too much thinking to complete the assignment given by lecture R5: 4 subjects. It really bothers me mentally. I could not sleep because I had to complete the task in a short time R6: Thinking about things that shouldn't be repeated and mentally physically exhausting R7: Not enough time to rest and sleep R8: Overthinking	

Table 2: Analysis of External Factors

Research Question	Respondent	External Factors
How were the financial problems that caused you to experience mental health problems in online learning during the Covid-19 pandemic?	R1: During the Covid-19 pandemic, citizens could not go out to work and no income came in. Therefore, students cannot go out to work part time to buy necessities during the online learning process. For example, repairing a broken laptop	Financial Challenges

	R2: When the Covid-19 pandemic happened, I was unable to buy a lot of internet data deck because of having financial problems and I didn't want to bother both my parents to buy internet data for me
	R3: This financial problem takes effect when money for daily necessities has to be used to buy internet data
	R4: For some people financial problems are the biggest problem because nowadays everything requires money for example in online learning during this pandemic requires gadgets such as phones, laptops and related besides that the most mandatory thing is the internet. Slow internet will make me stress
	R5: Very uncomfortable because the internet at home is very unhelpful. I had to drive down the road just to submit work or enter classes
	R6: Yes, when online learning, the learning process requires equipment such as a strong internet network, gadgets (laptop/phone) that can accommodate large applications such as google meet and Microsoft team. It had to incur huge expenses
What are the causes of poverty that are a major factor in your mental health problems while studying online? Explain why.	R8: The lecturer told me to buy the book on the online platform (Shopee etc.) and the price was a bit expensive. However, if on campus can be borrowed at the university library. In addition, unstable internet data
	R1: Yes. The cause of poverty is one of the main factors that become a mental health problem because without finance the learning process cannot run smoothly
	R2: Yes, this is because financial problems have a huge impact on me. I couldn't join classes online like my other friends because I couldn't afford an expensive internet network and it caused me to miss a lot in all the subjects I took
	R3: No, the cause of poverty is not mental health problems

	R4: Maybe yes, because as I said everyone needs money to buy gadgets to study, the internet and so on	
	R5: Yes. Noisy and uncomfortable environment	
	R6: No. Poverty does not cause mental health problems can occur. If necessary, we can get a solution as soon as possible, through the help of zakat & so on	
	R8: Yes, by not having the money to buy reference books and internet data it will interfere with my mental health	
How can a lot of work cause you stress?	R1: Many tasks and the time given to complete the task is relatively short and not long	Bundles of Assignment
	R2: A lot of work can make me stressful if I work in a group, but there are some people who are just 'free riders' in the group and only rely on others to complete their part	
	R3: The tasks given are not easy to understand and difficult to complete	
	R4: Yes, too many tasks make me feel burdened and cause stress	
	R5: Online learning is very easy to do but the cost to subscribe to the internet is very expensive and I am the only one who uses it	
	R6: Because of not enough time and a lot of work at one time	
	R7: Yes	
	R8: The assignment submission date is nearby and not much information can be found on the internet website	
How many subjects have too many assignments and is it detrimental to your mental health?	R1: 3 subjects. It is detrimental to mental health	
	R2: 2. Yes, it is detrimental to my mental health for overthinking the assignments given with respect to the subject	
	R3: The number of subjects who had too many assignments, as many as 3 subjects and yes, it was detrimental to my mental health	
	R4: At university maybe 1 or 2 only. It's detrimental to mental health because I think too much about unfinished work	

R5: Yes. Apart from having to subscribe to the expensive internet, I also had to buy books that were quite expensive and only used at that time

R6: 4 subjects and all online. In addition, it is only guided by a little slide information. Yes, it can be mentally detrimental to me

R7: Group assignment and due date shortly from the given date

R8: 7 subjects. Yes, it is to some extent detrimental to my mental health

Table 23: Analysis of Environmental Factors

Research Question	Respondent	Environmental Factors
How was your learning environment at home during online learning during the Covid-19 pandemic?	R1: Comfortable environment but sometimes the situation of noisy house people is quite disturbing R2: Very not conducive to doing classes or learning online R5: Very uncomfortable because the internet at home is very unhelpful. I had to drive down the road just to submit work or enter classes R7: No R8: Sometimes good, however if the line is unstable, it will interfere with my learning	Unconducive Learning Environment
Do you have an unconducive learning environment? Explain why.	R1: Yes, because the condition of the house is small and has a large number of siblings R2: Yes, because in the back of my house there is a place where people do weld which can interfere with my learning because it is too noisy with the machine used. Also, if I wanted to record a video for an assignment I had to wait until late at night to record a video, because that was the only time my home area became quiet without the interruption of the machines used R5: Yes R7: According to the current situation, there is a time okay there is a time not	

	R8: Yes, because the roads close to the house and the neighbours are always making noise causing the learning situation to be less comfortable	
How is the internet connection in your area of residence during online learning?	R1: Internet connection that is not easily available due to living in a rural area R2: The Internet network in my area is moderate. Where sometimes the network is strong, and sometimes not strong and makes it hard for me to focus in class R3: Very satisfying, sometimes it also has internet network problems R4: Good but sometimes when it rains it will be disturbed R5: Very unhelpful R7: Not good R8: Sometimes stable and sometimes unstable	Internet Connectivity
Explain why the internet connection in your area of residence is the cause of your mental health problems?	R1: Difficult to get into class and unable to focus properly in online lessons R2: Not focusing in class for fear of being disconnected from the internet and making it difficult for me to take notes of what the lecturer told me because I was busy going in and out of the google meet R3: If there is no internet network, it causes all my tasks to be delayed and many things to be unresolved. It also causes me stress R4: During a rainy day, my internet line is a bit slow and it causes the learning process to be disrupted and sometimes I miss important information presented by the lecturer R5: I had to get out of the house area because there was no fast internet connection. I used to leave the house at 9pm and come home at 2am just for a meeting with friends and finishing work R7: During internet disruption, there will be disruption to online learning and unable to do work	

	R8: The difficulty of finding information for learning will be stressful

DISCUSSION AND RECOMMENDATION

As a student, it is normal if there is a little problem with mental health due to internal, external and environmental factors when there is too much time on learning without enough rest time. Even so, if the duration and frequency of mental health problems are due to such factors being frequent enough, it can cause the student to face relatively severe mental health problems that can affect his learning at the same time.

It is crucial for students to get treatments from a doctor if they have an unhealthy body are treated by a counsellor to reduce problems such as stress and other problems. In addition, students can also meditate and learn strategies or ways to reduce stress thus reducing the risk of being exposed to severe mental health problems.

Some students are also recommended to change their lifestyle and find ways to reduce the problems that can cause them to experience mental health problems. Based on the interviews among all the respondents, the majority of the respondents agreed and supported on the question stated that internal, external and environmental factors were prevalent among them all throughout the online learning during the Covid-19 pandemic. Therefore, students with such factors should control themselves to prevent themselves from the risk of getting severe mental health problems. Finding a doctor or counsellor is especially important for some students with mental health problems.

CONCLUSION

In conclusion, this study was achieved to determine the impact of COVID-19 on the mental health of undergraduate students UMK year 3. There are three factors that show undergraduate students UMK year 3 have mental health problems due to internal, external and environmental factors. A total of 8 respondents aged 21–23 years were selected from year 3 students with mental health symptoms to study their awareness of mental health throughout the online learning during COVID-19. The 8 respondents were interviewed, and some did not agree with the questions we asked.

Determinants of Green Product Purchase Intention among Adults in Malaysia

Virachan Ai Leang, Nurul Atikah Syamimi Zaidi, Zainatul Huda Mohamad, & Nurul Hafizah Mohd Yasin*

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email: hafizah.my@umk.edu.my

ABSTRACT

Green products are among the most frequently purchased products in the world due to their environmental sustainability promise. However, there is a scarcity of data on consumers' intentions to buy green products in emerging nations. Thus, this study aims to investigate factors that influence intention to buy green products among adults in Malaysia. A total of 302 respondents who are Malaysian adults have participated in this study. The findings indicated that consumer attitude, subjective norm, perceived behavioral control and green awareness have positive impact on the purchase intention for green products. However, environmental concerns do not influence purchase intention for green products. The findings from this study contribute to improve the understanding of intention to purchase green products, which could play a major role towards sustainable consumption.

Keywords: Environment sustainability, Attitude, Green Awareness, Subjective Norm, Perceived Behavior Control, Purchase intention

INTRODUCTION

Green products are safe, have high quality and may lead to sustainable development (Lijuan, 2003). In recent years, there has been substantial growth in green products manufacturing around the world. These items do not contaminate the environment and may be recycled or preserved using non-toxic materials (Calkins, 2008). This has resulted in an environmental sustainability development, which has caused changes in consumer demand and behavior.

Environmental concerns and challenges are now a worldwide concern that can be seen and discussed generally (Alam et al., 2019; Lucchetti et al., 2019). The recent awareness of environmental concerns have doubled, leading to the increasing consumption of green product (Ogiemwonyi et al., 2020) As a result, it gave exposure to many people to express concerns about the environment issues and challenges, especially among Asian consumers (Lucchetti et al., 2019).

Even though green products are among the most frequently purchased products in the world as they promote environmental sustainability, there is a scarcity of data on consumers' purchase intentions of green products in Malaysia. Thus, this study aims to investigate the factors that influence the intention to buy green products among adults in Malaysia. This research carries five objectives:

1. To examine the relationship between the environmental concern and intention to purchase green products among consumers in Malaysia.
2. To identify the relationship between the attitude of people and intention to purchase green products among consumers in Malaysia.
3. To investigate the relationship between the perceived behavioral control and intention to purchase green products among consumers in Malaysia.

4. To analyze the relationship between the subjective norm and intention to purchase green products among consumers in Malaysia.
5. To identify the relationship between the green awareness and intention to purchase green products among consumers in Malaysia.

Significant of the study
Government

This research can provide the Malaysian government, particularly the Ministry of Environment, which was established in 2009 data on factors in purchasing green products, thus expanding the use of green products.

Society

This study has the potential to raise public awareness about the purchase of green goods among adults. Factors that influence the purchase of green products are acceptance of product innovation or acceptance of services, and this adult group is a significant group to study for determining factors that influence consumer intention to purchase green products. Other factors, such as consumer willingness to pay more, influence their purchase intention of green products. As a result of this research, the public will be more aware of the environmental benefits of green products and their mindset will be cultivated to buy green goods that are less in demand among young people because they believe green goods are too expensive.

LITERATURE REVIEW
Theory of Planned Behavior

Ajzen's (1991) theory of planned behavior (TPB) explains the phenomenon of change-supporting behavior (Yadav et al., 2016). According to Vazifehdoust (2017), customer intentions to buy green products are highly influenced by a favorable attitude and assessment of the product's green worth. Similarly, Rizwan (2013) discovers that customer perceptions influence their desire to purchase greens. To fill the gaps, the theory of planned behavior has been used as the foundational theory in this study to explain the phenomena of behavioral intention to obtain a comprehensive model. This study is expanded by including the environment concern and green awareness as a new variable.

Environment Concern

People buy green products because they care about the environment (Yadav, 2016). Environmental concern is defined by Alibeli and Johnson (2017) as the extent to which people are aware of environmental issues and their willingness to solve environmental problems. Diamantopoulos et al. (2017) observes that environmental concern is an important factor in consumer decision making. Aman et al., observes that an increasing number of consumers with environmental concerns will increase the intention to purchase green products. Consumers having a higher level of concern towards the environment may result in the purchase of green products. Thus, environmental concern is often cited as a strong motivator to purchase

Attitude

According to Ramayah et al., (2010) attitude, which is a rooted psychological feeling, is the most important determinant of behavior intent. This represents the preferences and satisfaction with the desire to acquire items or services. With regards to consumer environmental concern shown through the purchase of green products, the test revealed significant variation across

(Sweeney & Soutar, year) discoveries about environmental issues, such as the purchase of eco-friendly products that are not well covered in the Malaysian context.

Perceived Behavior Control

According to Joshi & Rahman (2015), Perceived Behavior Control has a significant relationship with future buying behavior of green products. Consumers must have a strong belief in green consumption in order to satisfy their environmental obligations. Customers with a strong sense of behavioral control are more likely to buy green products (Chin, Jiang, & Mufidah, 2018).

Subjective Norm

Subjective norms is referred to as the impact or outcome of user intention and activity (Ajzen, 1985, 1991). According to Taylor & Todd, 1995, subjective norms are influenced by coworkers and managers (essentially others & friends). The views of others that impact a person's decision-making are referred to as Subjective Norms. If they feel that others important to them are likely to accept and carry out the conduct, the opposite is true (Hee, 2000). As a result, subjective standards are likely to influence intent to buy green products.

Green Awareness

Sustainable consumption, according to Roman et al. (2015), refers to the use of goods and services that satisfy basic needs and enable a better life quality while also minimizing the consumption of natural resources, the generation of toxic materials, waste, and pollutants over a life cycle, so that there is no risk of future generations being unable to meet their needs. The decision to buy green products revolves around ecologically friendly consumers (Lai & Cheng, 2016). Consumers who believe in the green concept are willing to spend more money to buy green organic products. Environmental advertising and ecological packaging are actively linked with the intention of purchasing green products (X. Ansar, 2013).

Research Hypothesis

Attitudes toward behaviors, subjective standards, and perceived behavioral control have been utilized to predict intentions to purchase green products. As a result, the current study uses the Theory of Planned Behavior model to conduct theoretical analysis and develop hypothetical models for further validation and investigation of adults' intention to purchase green products. However, to obtain a comprehensive model, this study is expanded by including the environment concern and green awareness as new variables. Hence, based on the above discussion, this study hypothesizes that:

H1	Environmental concern is positively associated with the purchase intention for green products among adults in Malaysia
H2	Attitudes of people is positively associated with the purchase intention for green products among adults in Malaysia
H3	Perceived behavioral control is positively associated with the purchase intention for green products among adults in Malaysia
H4	Subjective norm is positively associated with the purchase intention for green products among adults in Malaysia
H5	Green awareness is positively associated with the purchase intention for green products among adults in Malaysia.

Research Framework

The structure of the proposed framework is shown in Figure 1. In total, 5 hypotheses are drawn namely, environmental concerns towards purchase intention of green products, attitudes

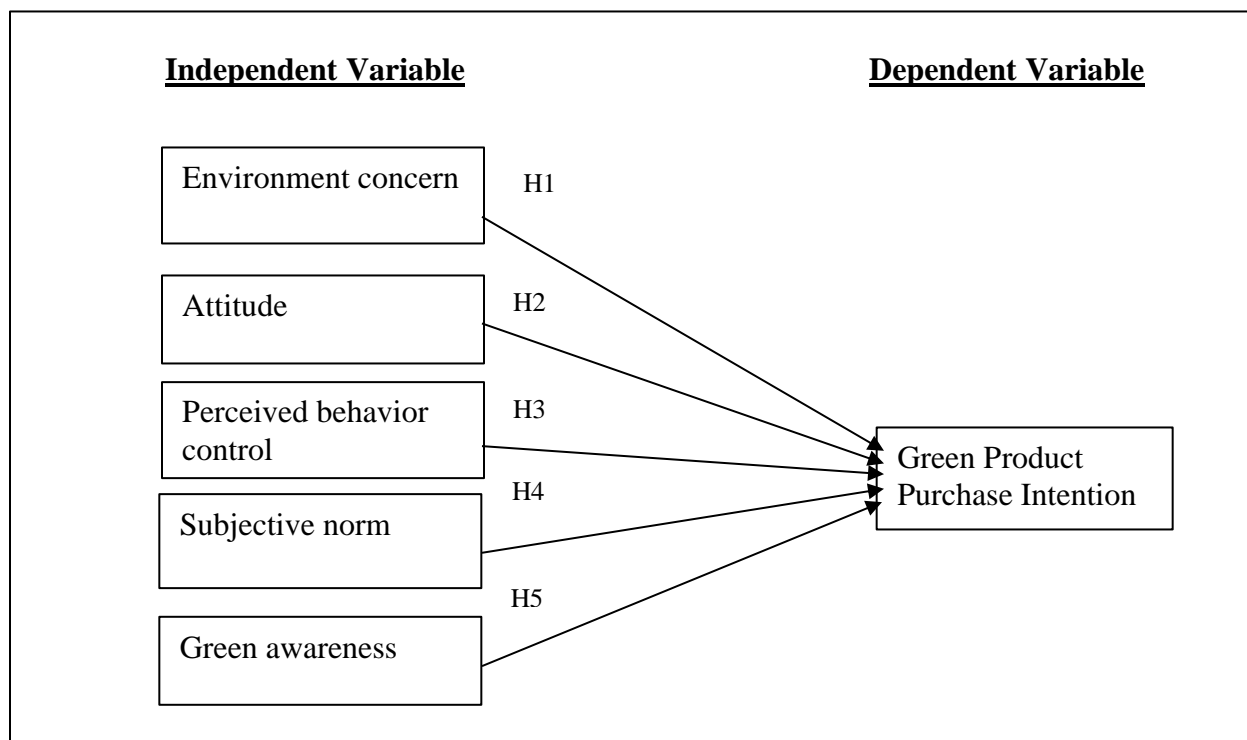
towards purchase intention of green products, perceived behavioral control towards purchase intention of green products, subjective norm towards purchase intention of green products, and green awareness towards purchase intention of green products.


Figure 1: Research Framework

METHODOLOGY

Research design

This study uses a quantitative research approach by using a correlational cross sectional research design. This study employs a cross-sectional survey method to collect green product purchase intention data. The cross-sectional design has the advantage of evaluating differences between different people, disciplines, or phenomena rather than a process of change.

Data collection

This study employs an online survey. According to Hair, Black, Babin, and Anderson (2010), an online survey can help decrease errors during the process. Google form is used to develop the online questionnaire. The web link for the online questionnaire is then distributed via social media platforms, such as Facebook, and through WhatsApp, and to personal contacts of the researcher. The data for this study have been obtained from 302 Malaysian consumers.

Sampling

Owing to the sampling frame unavailability, the non-probability technique is used in this study using purposive sampling. The researcher select Malaysian consumers who are above 18 years old, and who are expected to understand the concept of "green". The purposive sampling technique is suitable for this study because the respondents have to fulfill certain criteria to be selected as respondents. Non-probability sampling techniques are suitable for studying theoretical impact based on conceptual frameworks (Hulland et al., 2017; Hayat, Ngah, Hashim, Dahri, Malik, & Rahayu, 2019).

Data analysis

The data in this study has been analyzed using a statistical package named SPSS version 22.0 and SmartPLS 3 for analyzing partial least squares structural equation modeling (PLS-SEM) approach (Ringle, Wende, & Becker, 2015). SEM is a valuable tool in the behavioral and social sciences when many constructs are unobservable. SEM helps researchers assess each construct's dimensionality, reliability, and validity. SEM is a second-generation multivariate analysis technique developed to deal with latent constructs. Therefore, this study employed PLS-SEM for data analysis to answer the research questions and objectives.

This study applies PLS-SEM as a data analysis tool, which is a non-parametric statistical tool with functional prediction capability (Hair et al., 2014). Before proceeding with the PLS-SEM analysis, the data distribution has been assessed to verify that the data distributed are within the acceptable normality range with the deviation of variance sufficiently significant from average. This study uses web power

Available online at https://webpower.psychstat.org/models/kurtosis/results.php?url=64e873d898e8f07287f89698 3e3d643b to evaluate data distribution (Hair et al., 2017). The result depicted both Mardia's multivariate skewness ($\beta = 6.06817$, $p < 0.01$) and Mardia's multivariate kurtosis ($\beta = 58.75010$, $p < 0.01$), indicating that the data are not normally distributed and are significantly applicable to be used for progressing the regression analysis in SmartPLS.

FINDINGS

Demographic Analysis

The 302 respondents' demographic background is displayed in Table 1. The respondents' profile included their position, gender, age, and material status, level of education, occupation, and race. The majority of respondents are female (73.5%) and the remaining respondents (26.5%) were male.

Table 1 : Demographic Analysis

Categories	Frequency (N)	Percentage (%)
Gender		
Male	80	26.5
Female	222	73.5
Age		
18-20 years	94	31.1
20-25 years	184	60.9
26-30 years	17	5.6
31-35 years	7	2.3
Material status		
Single	261	86.4
Married	41	13.2
Level of education		
Diploma	85	28.1
Degree	163	54.0
Master	7	2.3
Others	47	15.6
Occupation		
Student	238	78.8
Employed	53	17.5

		5	1.7
Self-employed		5	1.7
Unemployed		6	2.0
Race			
Malay		244	80.8
Chinese		26	8.6
Indian		26	8.6
Others		6	2.0

Descriptive Analysis

Descriptive statistics summarizes how well a respondent responds to questions presented in a questionnaire. As reflected in this study, Table 2 shows the results for the mean, standard deviation, and variance for the construct of the present study.

Table 2: Descriptive Analysis

Variables	Mean		Standard Deviation	Variance
	Statistic	Std Error		
Environment Concern	4.1767	0.03032	0.52686	0.278
Attitude	4.2554	0.3110	0.54053	0.292
Perceived Behavioral Control	4.0445	0.03279	0.56975	0.325
Subjective Norm	3.9812	0.04008	0.69647	0.485
Green Awareness	4.3364	0.03363	0.58435	0.341
Purchase Intention	5.7936	0.05368	0.93281	0.870

Perceived behavioral control and subjective norm are reported to have a moderate level of agreement (3.9771 ± 0.56975) and (3.9812 ± 0.69647). The remaining constructs indicate mean scores with a high agreement. In ascending order, other constructs scoring between medium to high in mean values are green awareness (4.3364 ± 0.58435), environment concern (4.1767 ± 0.52686), intention (5.7936 ± 0.93281), and attitude (4.2554 ± 0.54053), respectively.

Convergent Reliability

The measurement model can be confirmed valid and reliable if the loading is higher than 0.5, the average variance extracted (AVE) is higher than 0.5, and the composite reliability is higher than 0.7, respectively (Hair et al., 2017). The summary of convergent validity for the measurement model is shown in Table 3.

Table 3: Convergent Reliability

Construct	Items	Loadings	AVE	CR
Attitude	I think that purchasing green product is favorable	0.624	0.536	0.902
	I think that purchasing green product is a good idea	0.778		
	I think that purchasing green product is safe	0.760		
	I feel environmental protection is important to me when buying a green product.	0.810		
	I feel green product help to reduce pollution.	0.698		
	I feel that green product help to save nature and its resources.	0.701		

	I feel given a choice; I will prefer a green product compared to non-green product.	0.690		
	I think that purchasing green product is favorable	0.776		
Environment concern	I am very concerned about the state of the world's environment	0.663	0.875	0.501
	I am willing to reduce my consumption to help protect the environment	0.687		
	Major social changes are necessary to protect the natural environment	0.700		
	I prefer to check the eco-labels and certifications on green products	0.703		
	I would prefer to gain substantial information on green products before purchase	0.719		
	I want to have a deeper insight of the inputs, processes and impacts of product before purchase	0.760		
	I intend to purchase green products next time because of its positive environmental contribution	0.717		
Green awareness	I think I have a responsibility to protect the environment.	0.824	0.894	0.678
	I think the environment is getting worse due to pollution.	0.785		
	I don't think the environmental problem will affect human life	0.864		
	I think advocating an environmental lifestyle is necessary	0.818		
Perceived behavioral control	I am confident that I can purchase green products rather than normal products when I want	0.702	0.551	0.917
	I see myself as capable of purchasing green products in future	0.819		
	I have resources, time and willingness to purchase green products	0.764		
	There are likely to be plenty of opportunities for me to purchase green products	0.751		
	I believe it's entirely my decision to buy a green product.	0.816		
	I don't believe I can pay more to buy a green product.	0.688		
	I believe I require a lot of time to search for a green product.	0.633		
	I believe I am confident about the credibility of the green product label.	0.715		
	I believe I can buy a green product for an ecological reason	0.746		
Purchase intention	I intend to purchase green products next time because of its positive environmental contribution	0.883	0.926	0.806
	I plan to purchase more green products rather than normal products	0.911		

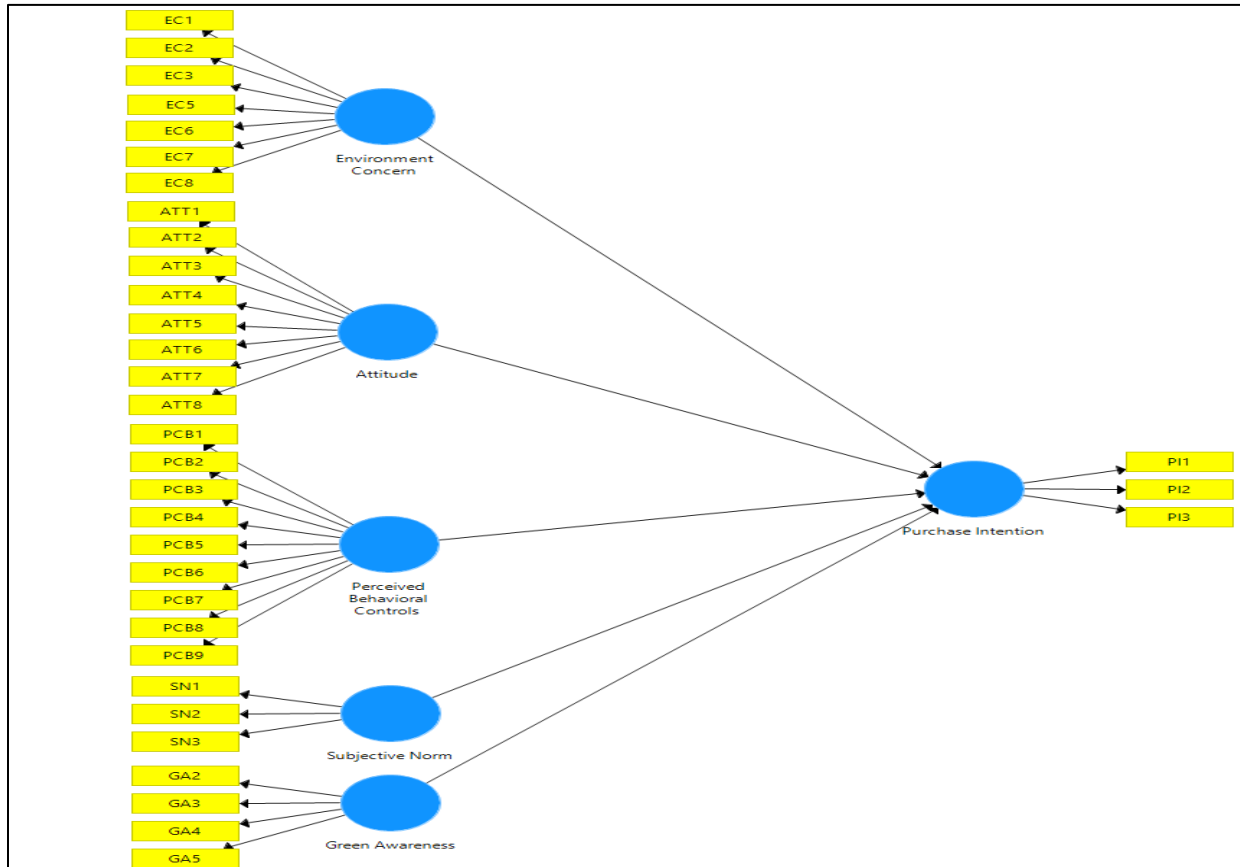
	I will consider switching to eco-friendly brands for ecological reasons	0.898				
Subjective norm	My family think that I should purchase green products rather than normal products	0.861	0.891	0.773		
	My close friends think that I should purchase green products rather than normal products	0.861				
	Most people who are important to me think I should purchase green products rather than normal products	0.845				


Figure 2 : Research Model

Discriminant Validity

The next step is discriminant validity to confirm that the construct is statistically unique and differs from other constructs (Hair et al., 2019). The discriminant validity of the constructs is established because the square root of the AVE (given on the diagonal line) is larger than the shared variance between variables, as shown in Table 4 below (Hair et al., 2019). In terms of the HTMT criterion, the values should not be more than 0.90 (Franke and Sastedt, 2019). Given that all values are less than 0.90 (Franke and Sastedt, 2019), Table 4 shows the discriminant validity established from the HTMT criterion. It can be stated that the respondents recognized the differences between the various constructs. The measuring items are valid and reliable, according to these validation tests.

Table 4: Discriminant Validity

	1	2	3	4	5	6
Attitude	▅▅▅					
Environment concern	0.879	▅▅▅				

Green awareness	0.879	0.718			
Perceived behavioral control	0.845	0.835	0.683		
Purchase intention	0.755	0.703	0.682	0.746	
Subjective norm	0.588	0.591	0.378	0.766	0.650

Direct Hypothesis

The structural model for collinearity issues should be checked by examining the VIF values of all sets of predictor constructs in the structural model (Hair et al., 2017). The values for the VIF of each sample construct are smaller than 3.3, as advocated by Diamantopoulos and Siguaw (2006). The present analysis confirms that collinearity is not a problem and the research can progress to the testing of hypotheses.

The research hypotheses may be supported if the beta values are in accordance with the hypothesis's direction, t-values, and p-value. In terms of confidence interval, which is lower level (LL) and upper level (UL), it should not straddle or overlap at zero between the LL and UL (Hair et al., 2018). In the present analysis, a bootstrapping approach with resampling of 500 is used, in which the findings for the direct effect show that five hypothesized relationships are supported, and one hypothesized relationship is not supported. The first hypothesis, environment concern is not related to intention ($ß = 0.104$, t = 1.581, LL = 0.003, UL = 0.214, p=0.057). The second hypothesis, attitude is positively related to intention ($ß = 0.168$, t = 2.208, LL = 0.040, UL = 0.295, p < 0.05). Next, third hypothesis, perceived behavioral control is positively related to intention ($ß = 0.180$, t = 2.243, LL = 0.052, UL = 0.331, p < 0.05). This is followed by the fourth hypothesis, subjective norm that is positively related to intention ($ß = 0.226$, t = 4.438, LL = 0.137, UL = 0.308, p < 0.000). The fifth hypothesis, green awareness, is positively related to intention ($ß = 0.225$, t = 3.708, LL = 0.113, UL = 0.317, p < 0.000). The table below indicates that five direct hypotheses developed for the model are significant; thus H2, H3, H4, H5 are accepted, and one hypothesis is not supported; thus, H1 is rejected.

Table 5: Direct Hypothesis

Relationship		Std Beta	Std Error	t value	p value	Confident interval		VIF	Decision
						LL	UL		
H1	Environment Concern ☐ Intention	0.104	0.066	1.581	0.057	0.003	0.214	2.672	Not Supported
H2	Attitude ☐ Intention	0.168	0.076	2.208	0.014	0.040	0.295	3.357	Supported
H3	Perceived Behavioral Control ☐ Intention	0.180	0.080	2.243	0.013	0.052	0.331	3.316	Supported
H4	Subjective Norm ☐Intention	0.226	0.051	4.438	0.000	0.137	0.308	1.815	Supported
H5	Green Awareness ☐ Intention	0.225	0.061	3.708	0.000	0.113	0.317	2.442	Supported

DISCUSSION & RECOMMENDATIONS

This study aims to identify the purchase intention for green products among adults in Malaysia. While limitations exist in all forms and areas of research, these projects often provide new discoveries, which create a foundation for future work to be built. Firstly, future research should expand the geographical coverage of the study with respect to population and distribution of questionnaires. The current study only focuses on the intention to purchase green products among adults in Malaysia. Secondly, a longitudinal approach is proposed as part of the research method for further research to ensure changes in attitudes and buying intentions. Such an approach would be very useful in observing the reaction of consumers intending to purchase more sustainable products. Thirdly, future research is recommended to test marker variables to avoid common method bias from self-reported measurements. Future studies could use a variety of informants to improve the validity of study findings as well.

This study explores the intention to buy green cosmetics through green awareness, attitude, and subjective norms as antecedents of buying intention. This study contributes to the literature by examining and supporting the effects of TPB variables, environment concern, attitudes, and subjective norms on green product purchasing intentions, and exploring the motivational factors of green attitudes. Innovative research is in introducing the influence of social media on the elements of TPB and the formation of altruistic and egoistic motivations in the case of green products.

The results of this study confirm that effort expectations are strong predictors of green product purchase intentions among adults in Malaysia. RQ1 to examine the relationship between environmental concern and intention to purchase green products among adults in Malaysia is certified because the(H1) environmental concern to buying intention Environmental concern is not supported in association with the purchase intention for green products among adults in Malaysia. In contrast, Chen and Tung (2014), and Paul et al. (2016) found that environmental concern had to be significant and positive for attitude, perceived behavioral control and purchase intention for a green product. The results of this study do not support environmental concern and may not alter the positive relationship between environment concern and intention to purchase green products, as stated in the hypothesis.

The outcomes of this study confirm that effort expectancy is a strong predictor of green product purchase intention among Malaysian consumers. RQ2 that refers to the attitude influencing the intention to purchase green products among adults in Malaysia is affirmed since the (H2) attitude to purchase intention the relationship between the attitudes and purchase intention of green products among adults in Malaysia is supported. According to Ogiemwonyi (2020), positive attitude is necessary to provide a positive impact on an individual or assignment, as they may instead, turn into attitude when the individual is unable to cope with a given situation.,. The outcomes of this study support the consumers who are knowledgeable about the environment and have positive attitudes make favorable adjustments towards purchase intention for green products.

The present study is established to offer further knowledge and understanding of the empirical extent of the perceived behavioral control and intention to purchase green products among adults in Malaysia. RQ3, perceived behavior control influences the intention to purchase green products among adults in Malaysia is affirmed since the perceived behavioral control is positively associated with the purchase intention for green products among adults in Malaysia (H3) is supported. The outcomes of this study support that this finding indicates that perceived behavioral control is related to intention to purchase green product, which is consistent with the current research on registered adults, finding similar statistically significant associations between perceived behavioral control and intention to purchase green product.

The present study set out to shed light on the relationship between the subjective norms and the intention to purchase green products among adults in Malaysia. RQ4 subjective norm influences the intention to purchase green products among adults in Malaysia is implied. Subjective norm is positively associated with the purchase intention for green products among adults in Malaysia (H4) is supported. The findings are consistent with previous research, this result indicates that the highly environmentally concerned students' perceived a stronger support from important reference than low concerned students (Paul, J.; Modi, A.; Patel, J, 2016). The outcomes of this study support that it can be concluded that the generalization of the TPB model in predicting subjective norm satisfaction is applicable in the context of intention to purchase green products.

The present study intends to shed some light on the empirical extent of green awareness as a mediating effect in the relationship between green awareness and intention to purchase green products in Malaysia. In RQ5, green awareness influences the intention to purchase green products among adults in Malaysia is affirmed when green awareness is positively associated with the purchase intention for green products among adults in Malaysia. (H5) is supported. Many studies have argued that attitudes impact green culture (Zheng and Chi, 2015). The outcomes of this study support significant influence on attitude and green culture and found that green awareness is strongly predicted by intention to purchase green product. Green awareness among adults is found to be a significant predictor of intention to purchase green product

CONCLUSION

This study provides a better understanding of the factors of green product purchase intention among adults to help green product manufacturers and government to improve the green product industry market. The findings of this model indicate that consumer attitude, subjective norm and perceived behavioral control and green awareness have positive influences on the purchase intention for green products. However, environmental concerns do not influence purchase intention for green products. Therefore, to enhance the green product purchase intention, the related industry should focus on these factors. The industry should focus on enhancing green awareness rather than environmental concerns.

ABSTRACT

Interest in green, sustainable, and natural products is on the rise in the health and beauty products market. The intention to purchase green cosmetics is crucial for the sustainability of green cosmetics manufacturers. In this regard, the current study examined factors influencing green cosmetic purchase intention among Malaysian consumers. The authors used the theory of planned behavior to identify green cosmetics purchase intention among consumers in Malaysia. A total of 291 responses were analyzed with smart partial least square. The analysis revealed that attitude, environmental concern, subjective norms, perceived behavioral control, product availability, and have a positive influence on the purchase intention of green cosmetics in Malaysia. The findings are essential for the green cosmetics manufacturers to craft a marketing strategy aimed at green cosmetics consumers in Malaysia.

Keywords: Intention to purchase, Green Cosmetics, Consumers, theory of planned behavior.

INTRODUCTION

Green cosmetics in the health and beauty industry are growing. According to Tien, Phuc, Phu, Duc & Thuc (2019), green can be defined as products that will not pollute the earth or destroy natural resources. Consumers of green cosmetics define terms like natural ingredients and environmental protection, and they buy these products for personal and environmental reasons (Lin & Niu, 2018).

Consumers' consciousness about the risks of using synthetic chemicals is increasing exponentially, which has led to a demand for healthier choices. Allergies and skin damage caused by synthetic beauty products become one of the reasons for a consumer to be more concerned about the environment when it comes to cosmetics. Challenges and values in the decision-making process for products might give marketers a greater understanding of green consumers, both theoretical and practical (Ghazali et al., 2017).

Interest in green, sustainable, and natural products is on the rise in the health and beauty products market. Green cosmetics are frequently more expensive, which means that fewer people will be able to use them. Lack of understanding among consumers about cosmetics poses a considerable health concern, particularly in underdeveloped nations. Hence, the study intends to examine the factors influencing the intenion to purchase green cosmetic products.

There were six objectives of this study as follows:

1. To determine the influence between attitude and consumer purchase intention of green cosmetics products in Malaysia.
2. To determine the influence between environmental concern and consumer purchase intention of green cosmetics products in Malaysia.

3. To determine the influence between subjective norms and consumer purchase intention of green cosmetics products in Malaysia.
4. To determine the influence between perceived behavioral control and consumer purchase intention of green cosmetics products in Malaysia.
5. To determine the influence between product availability and consumer purchase intention of green cosmetics products in Malaysia.
6. To determine the influence between price and consumer purchase intention of green cosmetics products in Malaysia.

Significance of the Study
Theoretical Perspective
Owing to the scarcity of the literature on intention to purchase green cosmetics in Malaysia, the findings of the study provide a new direction to promote green cosmetics.

Practical Perspective
The findings are essential for the green cosmetics manufacturers to craft a marketing strategy aimed at green cosmetics consumers in Malaysia.

LITERATURE REVIEW
Attitude
According to Tan, Ojo, and Thurasamy (2019), attitude is defined as an individual's taught inclination to engage and respond continually towards a favorable or unfavorable attitude. This demeanor reflects their preferences and dislikes. According to Mostafa (2016), one's attitude toward this behavior strongly predicts green consumption. It refers to a consumer's mentality that led to or increased their willingness to use green cosmetic products.

Environment Concern
According to Royne, Levy and Martinez (2011), a green or eco-friendly product is designed to have a minimal environmental impact on consumers. Given that most of the manufacturing process is concerned about the effects of ecology, an environmentally conscious consumer's ability and desire to choose more eco-friendly products over commercial products. According to Amberg and Fogarassy (2019), green cosmetics are one of the commercially accessible green goods.

Subjective Norms
Subjective norms refer to specific behavior of important individuals influencing perceived social pressure. Multiple earlier research in the green consumption literature demonstrates that the association between subjective norms and green commodity purchase intention is inconsistent (Pop et al, 2020; Ghazali et al, 2017; Uddin & Khan, 2018; Nguyen et al, 2016).

Perceived Behavioral Control
According to Yadav and Pathak (2017), perceived behavioral control is defined as an individual's feeling of ability and empowerment leading to the seamless execution of purchase intention. Perceived behavior control refers to an individual's view of their capability or ability to choose the target behavior, according to Rubinelli and Diviani (2020). Afroz, Masud, Akhtar, Islam, and Duasa (2015) found that perceived behavioral control is a critical component of TPB and a strong predictor of green consumption intention.

Availability of Green Cosmetics

If green products are readily available, consumers will be more aware of and assess them before purchasing (Kapoor, Singh, & Misra, 2019). Consumers are more inclined to use green products because they are widely available. Green cosmetics products are more readily available, which may increase one's desire to use green products (Dhanwani, Jainani & Ojha, 2020). The availability of green products offers ease of buying, ready comparison among products, and ease of exchange or return of products. Availability enhances a consumer's awareness and intention of green products before an actual purchase (Kapoor, Singh, & Misra, 2019).

Price

Price has been described as cost in traditional economics. However, pricing serves to inform individuals about the value of the good or service (East, 1997). Although many people are interested in green cosmetics, a small number of consumers intend to use green products (Mamun, 2020). According to Mamun, Mohamad, Yaacob, and Mohiuddin (2018), green consumption is favored by the educated and affluent parts of society; the rich and educated make up just 20% of the population.

Purchase Intention Green Cosmetics

Consumer purchasing intentions are efforts to acquire services or goods, yet do not mean the presence of purchasing behavior. Many studies clarify purchase intention for green and natural goods, showing more prominent purchasing goals when there is an ideal mentality. Preliminary studies also found a positive relationship between expectation, perspective, and recurrence for repurchasing and consuming the green product (Van Loo et al, 2013).

Research Hypotheses

The following six hypotheses were indicated based on the research objectives:

> H1: Attitude has a positive influence on the green cosmetics purchase intention among Malaysian consumers.
> H2: Environmental concern has a positive influence on the green cosmetics purchase intention among Malaysian consumers.
> H3: Subjective Norms have a positive influence on the green cosmetics purchase intention among Malaysian consumers.
> H4: Perceived behavioral control has a positive influence on the green cosmetics purchase intention among Malaysian consumers.
> H5: Availability has a positive influence on the green cosmetics purchase intention among Malaysian consumers.
> H6: Price has a positive influence on the green cosmetics purchase intention among Malaysian consumers.

Research Framework

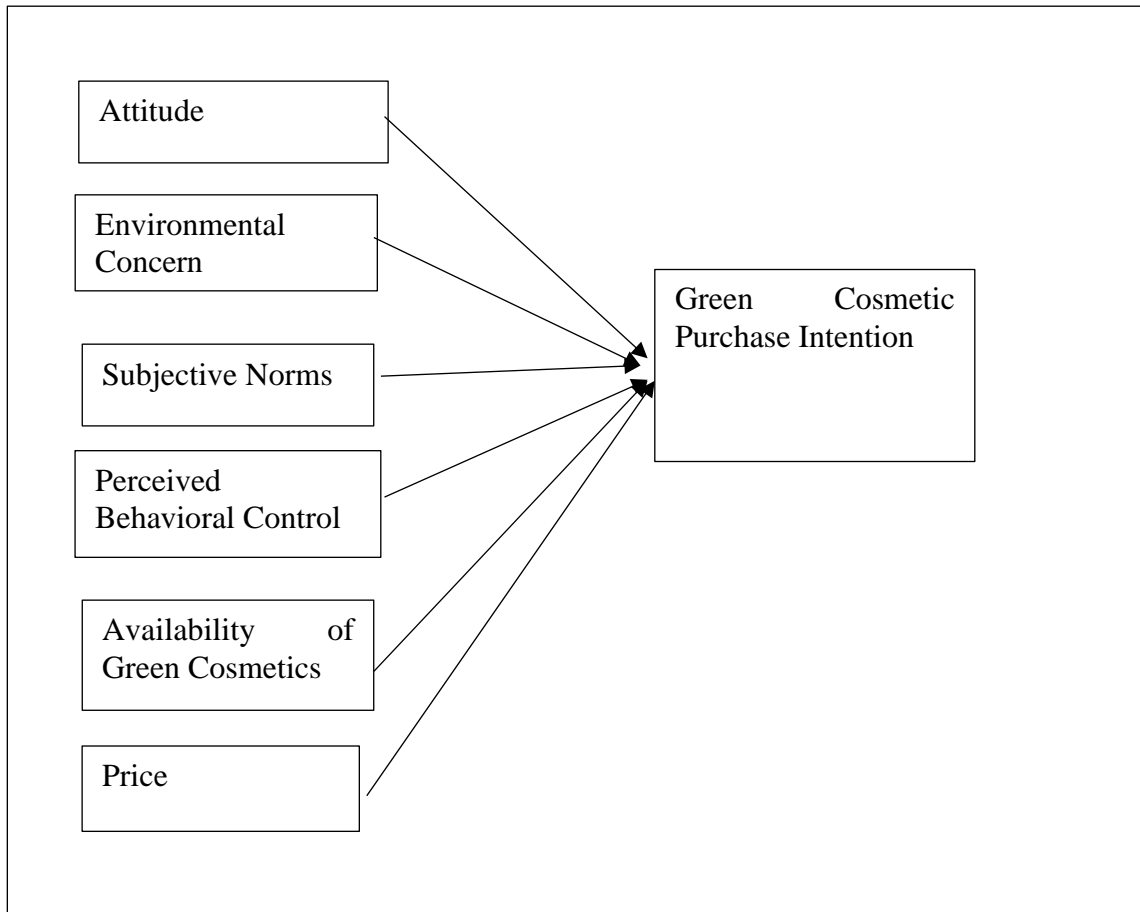
A research framework has been developed to investigate the connection between the research variables. The study's dependent variable includes green cosmetic purchase intention, while the independent variables include attitude, environmental concern, subjective norms, perceived behavioral control, availability of green cosmetics, and price.


Figure 1: Research Framework

METHODOLOGY

Research Design

This study used a quantitative research approach by using a correlational cross-cross sectional research design. This study employed an online survey. An online survey can help decrease errors during the process.

Data Collection

Google form was used to develop the online questionnaire. The weblink for the online questionnaire was then distributed via social media platforms, such as Facebook, and WhatsApp, and through personal contacts of the researcher. About 310 respondents participated in this study.

Sampling

Owing to the sampling frame's unavailability, the non-probability technique was used in this study using purposive. The researcher selected Malaysian consumers who are above 18 years old, and who expected to understand the concept of "green". The purposive sampling technique was suitable for this study because the respondents must fulfill certain criteria to be screened as respondents. Non-probability sampling techniques are suitable for studying theoretical impact based on conceptual frameworks (Hulland et al, 2017; Hayat, Ngah, Hashim, Dahri, Malik, & Rahayu, 2019).

Data Analysis

Because of the exploratory character of the study (Hair et al, 2017), the data were analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM) approach (Ringle, Wende, & Becker, 2015).

FINDINGS

Frequency Analysis

The respondents' demographic majority were female (75%), and Respondents aged between 20 to 30 years (82.6%). As for the respondents' ethnicity, most were Malay (88.5%). Concerning their marital status, 81.9% were single. In terms of education, more than half of the respondents have a Degree (81.9%). Lastly, the descriptive analysis revealed that most of the respondents (62.5%) received a monthly income of less than RM1000 a month.

Table 1: Profile of the respondents

Demographic	Categories	Frequency	Percentage (%)
Gender	Male	76	25
	Female	228	75
Age	Less than 20 years old	10	3.3
	20-30	251	82.6
	31-40	24	7.9
	41-50	10	3.3
	51 years and above	9	3
Race	Malay	269	88.5
	Chinese	6	2
	Indian	4	1.3
	Others	25	8.2
Marital Status	Single	249	81.9
	Married	54	17.8
Highest Education	Certificate	2	0.6
	SPM	35	11.5
	STPM/ A LEVEL	4	1.3
	Diploma	58	19.1
	Degree	187	61.5
	Master	15	4.9
	PhD	2	0.7
Monthly income	Less than RM1000	190	62.5
	RM1001-RM3000	79	26
	RM3001-RM5000	23	7.6
	RM5001-RM7000	3	1
	RM7001 and above	9	3

Convergent Reliability

The measurement and structural models were used in this study to test the research hypothesis in two steps. Convergent and discriminant validity are the two types of validity analyses. This analysis must be completed before moving on to the following analysis step. The measurement model can be confirmed valid and reliable if the loading is higher than 0.5, the average variance extracted (AVE) is higher than 0.5, and the composite reliability is higher than 0.7, respectively

(Hair et al, 2017). Given that all values are less than 0.90 (Franke and Sastedt, 2019), Table 3 shows the discriminant validity which was established from the HTMT criterion. It can be stated that the respondents recognized the differences between the various constructs. The measuring items are valid and reliable, according to these validation tests.

Table 2: Measurement Model (Convergent validity)

Constructs	Items	Loadings	AVE	CR
Attitude	AT1	0.721	0.639	0.898
	AT2	0.774		
	AT3	0.847		
	AT4	0.822		
	AT5	0.828

	PRC2	0.890		
	PRC3	0.863		
	PRC4	0.820		
	PRC5	0.842		
Green Cosmetics Purchase Intention	PINT1	0.890	0.768	0.943
	PINT2	0.891		
	PINT3	0.858		
	PINT4	0.880		
	PINT5	0.862		

Discriminant Validity

Table 3 below shows the result of discriminant validity of this research.

Table 3: Discriminant Validity using HTMT criterion

	1	2	3	4	5	6	7
1. Attitude	0.800						
2. Availability	0.619	0.843					
3. Environment concern	0.760	0.679	0.853				
4. Perceived Behavioural Control	0.514	0.690	0.628	0.840			
5. Price	0.640	0.805	0.690	0.685	0.857		
6. Purchase Intention	0.726	0.631	0.642	0.620	0.693	0.876	
7. Subjective Norm	0.611	0.708	0.737	0.752	0.618	0.618	0.806

Direct Hypothesis

The structural model analysis puts the hypotheses produced in the study's research framework to the test. By assessing the VIF values of all sets of predictor constructs in the structural model for collinearity issues, the structural model should be evaluated for problems (Hair et al, 2017). All values for the VIF of each sample construct are smaller than 3.3, as indicated in Table 4, as proposed by Diamantopoulos and Siguaw (2006). The current study demonstrates that collinearity was not an issue, allowing ideas to be tested.

Table 4 below shows that the first hypothesis, attitude was supported related to Purchase Intention (ß = 0.470, t = 5.573, LL = 0.342, UL = 0.619, p < 0.05). The second hypothesis, availability was negatively related to intention (ß = 0.005, t = 0.050, LL = -0.181, UL = 0.153, p < 0.05). Next, third hypothesis, environment concern was negatively related to intention (ß = 0.042, t = 0.425, LL = -0.219, UL = 0.112, p < 0.05). This is followed by the fourth hypothesis, trust was positively related to intention (ß = 0.211, t = 1.797, LL = 0.006, UL = 0.385, p < 0.05). The fifth hypothesis, price was positively related to intention (ß = 0.268, t = 2.629, LL = 0.109, UL = 0.444, p < 0.05) and lastly, the sixth hypothesis, subjective norm was negatively related to giving behaviour (ß = 0.018, t = 0.244, LL = -0.122, UL = 0.136, p < 0.05). Table 4 below indicates that six direct hypotheses developed for the model for H1, H4 and H5 were accepted while, H2, H3, and H6 were not supported.

Table 4: Hypothesis testing.

	Relationship	Std Beta	Std error	t value	p values	CI LL UL		VIF	Decision
H1	Attitude ⬜ Purchase Intention	0.470	0.084	5.573	0.000	0.342	0.619	2.553	Supported
H2	Availability ⬜ Purchased Intention	0.005	0.101	0.050	0.480	-0.181	0.153	3.202	Not Supported
H3	Environment Concern Control ⬜ Purchase Intention	0.042	0.100	0.425	0.335	-0.219	0.112	3.255	Not Supported

H 4	Perceived Behavioral $\square$ Purchase Intention	0.21 1	0.11 7	1.797	0.03 6	0.00 6	0.38 5	2.69 3	Support ed

Note: CI= Confidence Interval, UL= Upper Level, LL= Lower Level

DISCUSSION AND RECOMMENDATION

This study looked into the elements that influence Malaysian consumers' intention to buy green cosmetics. The goal of this study is to determine the influence of attitude, environmental concern, subjective norms, perceived behavioral control, product availability, and price on consumers' intention to buy green cosmetics in Malaysia.

The present study explores green cosmetics purchase intentions through motivations, attitudes, and subjective norms as the antecedents of purchase intentions. This study contributes to the literature by examining and supporting the effects of the TPB variables, attitudes, and subjective norms on green cosmetics buying intentions, and exploring the motivational factors of the green attitude. The innovativeness of the research is in introducing the influence of social media on elements of TPB and the formation of altruistic and egoistic motivations in the case of green cosmetics.

The outcomes of this study confirm that effort expectancy is a strong predictor of green cosmetics purchase intention among Malaysian consumers. RQ1 was affirmed since the attitude to purchase intention (H1) was supported. The findings are consistent with previous research, which revealed that effort expectations are positively connected to green cosmetics purchasing intent (Al Mamun et al., 2020). The outcomes of this study support the importance of effort expectancy as a significant predictor of Malaysian consumers' intentions to purchase green cosmetics.

The results of the hypothesis testing for the green cosmetics products on the correlation between availability to purchase intention (H2) was not supported, it implies that RQ2 was not confirmed. The findings are consistent with previous research, which revealed that effort expectation is negatively connected to the intention to purchase green cosmetics. The outcomes of this study do not support the importance of effort expectancy as a significant predictor of Malaysian consumers' intentions to purchase green cosmetics. The findings are consistent with previous research, which revealed that effort expectation is negatively connected to the intention to purchase green cosmetics.

The hypothesis testing results for green cosmetics items on the relationship between availability and purchase intent (H3) were not significant, it implies that RQ3 was not confirmed. The findings are consistent with previous research that revealed that effort anticipation is negatively connected to green cosmetics purchase intention. The outcomes of this study do not support the importance of effort expectancy as a significant predictor of Malaysian consumers' intentions to purchase green cosmetics.

The link between perceived behavioral and purchase intention (H4) was shown to be significant in the hypothesis testing for green cosmetics items. The findings are consistent with previous research, which revealed that effort expectation is positively connected to the intention to purchase green cosmetics (Al Mamun et al, 2020) The purchasing intention of green cosmetics among Malaysian consumers is positively related to perceived behavioral control. The outcomes of this study support the importance of effort expectancy as a significant predictor of Malaysian consumers' intentions to purchase green cosmetics. The findings are consistent with previous research.

The association between price and purchase intention (H5) was shown to be significant in the hypothesis testing for green cosmetics goods, it implies that RQ5 was not supported. The findings are consistent with previous research, which revealed that effort expectation is positively connected to the intention to purchase green cosmetics (Al Mamun et al, 2020) The price has a beneficial impact on Malaysians' desire to buy green cosmetics. The outcomes of this study support the importance of effort expectancy as a significant predictor of Malaysian consumers' intentions to purchase green cosmetics. The findings are consistent with previous research.

The outcomes of this study confirm that effort expectancy is a strong predictor of green cosmetics purchase intention among Malaysian consumers. RQ6 was not confirmed since subjective norms regarding buy intention (H6) were not supported. The findings are not consistent with previous research, which revealed that effort expectations are positively connected to green cosmetics purchasing intent (Al Mamun et al., 2020). The outcomes of this study not support the importance of effort expectancy as a significant predictor of Malaysian consumers' intentions to purchase green cosmetics.

In general, the factors influencing Malaysian consumers' desire to buy green cosmetics have been thoroughly investigated in this study. Based on the findings, the current study will make several recommendations for factors that influence consumers' decisions to buy green cosmetics, and future research that allows for the identification of factors that influence purchase intention can aid in the early detection and development of prevention strategies in a variety of ways. By identifying the characteristics that may influence green cosmetic purchasing intention among Malaysian consumers in the healthcare industry, healthcare practitioners should be well-equipped to address the issues with top management. They must carefully plan ways to entice more people to buy and use green cosmetics. They can, for example, undertake promotions and marketing.

The findings of the study are also crucial for future research. As a result, it is suggested that future research investigates the knowledge of factors that influence green cosmetics purchase intention by including more demographic characteristics of respondents, such as gender, age, marital status, level of education, race, and monthly income, to generate different results or findings from various perspectives. Six direct hypotheses developed for the model for H1, H4, and H5 were accepted while, H2, H3, and H6 were not supported.

The outcome is also beneficial to the green cosmetics industry. By focusing on green cosmetics items, the sectors must pay special attention to enticing customers. The chance of green cosmetics expanding is determined by consumers' relevant satisfaction with green cosmetics items. After receiving the results, we hope that future industries will be able to develop more green cosmetics as a result of their quality and customer awareness. The findings of this study help to better understand these sectors and outcomes in an industry that is responsible for increasing green cosmetics purchase intention.

CONCLUSION

In conclusion, this study has discovered factors influencing green cosmetic purchase intention among Malaysian consumers. The analysis revealed that attitude, environmental concern, subjective norms, perceived behavioral control, product availability, and have a positive influence on the purchase intention of green cosmetics in Malaysia. The findings are essential for the green cosmetics manufacturers to craft a marketing strategy aimed at green cosmetics consumers in Malaysia.

ABSTRACT

Malaysia was exposed to organic food as the country's growth changed. Even though it is still relatively new, it has garnered a positive reception. The current study, in this regard, intends to investigate young adults' intentions toward consuming organic food in Malaysia. The study uses the Theory of Planned Behavior (TPB) as a theoretical framework and expands on it by including two new components, health consciousness and environmental concern. Using an online survey, google forms, and the judgmental sampling approach, 324 valid responses were obtained. Partial Least Squares Structural Equation Modelling (PLS-SEM) was used to examine the data. In findings, TPB was found to be beneficial in predicting young individuals' intentions to consume organic foods. The outcome also validated and increased the prediction value of the suggested model. Finally, the consequences for policymakers and future research directions have been highlighted.

Keywords: organic food, theory planned behaviour, young adults, intention, consumption

INTRODUCTION

Organic foods are becoming more popular and appear to be relatively new in Malaysia, especially among the younger generation. Organic food demand has increased fast in Europe and North America, while it remains low in Malaysia (Hassan, Loi, & Kok, 2015). Although there is currently low demand for organic food in Malaysia, the trend towards organic food consumption and the consumer attractiveness of organic products is developing.

According to the International Federation of Organic Agriculture Movements (IFOAM), global organic food and beverage profits increased by $5 billion between 2010 and 2012, reaching around $6 billion in 2012 (Willer & Lernoud, 2014). However, due to the present trend of consumers, particularly young adults, becoming increasingly worried about the nutritional quality of foods and their health. Thus, demand for organic food items is becoming more noticeable, despite the premium or high pricing supplied.

Aside from the high price, the selection of organic food is limited. According to Ghosh, Barai, & Datta (2019), many researchers have identified a lack of customer awareness as a key barrier to organic food consumption, but none of them has elaborated on the level of customer involvement associated with organic food purchase.

The study aimed to investigate the factors influencing the intention to consume organic food among young adults. Young adults' eating habits and a lack of awareness of the health advantages of organic food consumption are causing challenges in developing a better and healthier lifestyle (Mamun et al., 2020). As a result, to stay healthy, young adults should consume organic foods.

There were five objectives of this research:

1. To identify the relationship between attitude and intention to consume organic food among young adults in Malaysia.
2. To investigate the relationship between perceived behavioral control and intention to consume organic food among young adults in Malaysia.
3. To examine the relationship between subjective norms and intentions to consume organic food among young adults in Malaysia.
4. To determine the relationship between health consciousness and intention to consume organic food among young adults in Malaysia.
5. To identify the relationship between environmental concern and intention to consume organic food among young adults in Malaysia.

Significance of the Study

Future Researchers

The results of this study will serve as a guide and resource for future research on the intention to consume organic food among young adults. Other researchers also can improve this study, as well as reorganize old studies to be utilized as new studies. More research is being carried out to gain a better idea of the scope of the investigation.

Ministry of Health

The significance of this study will provide information to the ministry to take appropriate action. In addition, this study also gives an idea to the government to further diversify programs related to healthy lifestyle practices, especially through the use of organic food. In daily life, programs such as seminars, talks, or pamphlets can help consumers get information related to organic food intake.

Consumer

This research can directly benefit young adults to prepare awareness of the intention to consume organic food due to attitude, perceived behavioral control, subjective norms, health consciousness, and environmental concern that can affect the intention to consume organic food. Consuming organic food is very important and gains benefits to young adults because they do not contain preservatives that can make them last longer.

Organic Food Store Operators (Supplier)

Suppliers are to be able to improve and identify the needs of buyers and consumers, especially from the aspect of demand and supply of organic food. This can increase the purchase of organic food from farmer's markets, local farms, and community-supported agriculture (CSA). While buying directly from farmers, consumers can provide knowledge such as organic methods used during planting, practices followed, and others. This will increase the knowledge and give ideas to support local and small organic farms.

LITERATURE REVIEW

Overview of Organic Food

The term "organic" refers to a food's production technique. Because of a surge in consumer environmental concerns, the organic food industry has recently shown a strong expansion trend. Recent research has looked at certain aspects of buyer behavior for new items (Qasim, Yan, Guo, Saeed, & Ashraf, 2019).

According to Somasundram, Razali, & Santhirasegaram (2016), recently the consumption of organic food has increased. Consumption in Malaysia remains a viable sector. East Malaysia's

organic product output is restricted to vegetables and fruit. (Somasundram et al., 2016). It demonstrates that the Malaysian organic food industry is still relatively small, but the demand from young adults is high.

Approximately 70% of organic food items were distributed through organic food stores and supermarket chains. Those findings suggest that organic food is essential for the high demand for organic food. Further research is needed to fully understand the factors that influence the intention to consume organic food in the context of Malaysian people

Consumer Intention

Consumer purchasing intentions for organic foods are defined to indicate the relative importance of factors such as health benefits, availability, and freshness as determinants of consumer intentions (Jeremy, Sierra, Turri Anne, & Harry, 2015). In this study, consumer intention refers to consumer attitude behavior to predict consumer intention to buy organic food. Moreover, consumer willingness to pay has inconsistent results. In addition attitudes, subjective norms, and perceived behavioral control were found to have a significant effect on young consumers 'intentions toward organic foods. Therefore, it can measure user intention and its relation to the independent variables in this study.

Attitude

Attitude is defined as the interaction in memory between a particular object and a brief assessment of that object. Attitudes may also reveal consumer psychological evaluations of products (Xu, Pan, Li, Lu & Zhang, 2020). However, attitude is referred to as the willingness of consumers to buy depending on their attitude. Attitude describes how an individual's emotions are. This is because a person's attitude can change due to feelings, circumstances, or anything else that is not pleasant to the owner of the attitude.

Attitudes also represent the actions of individuals to engage or refrain from engaging in behaviors related to current use or a particular product. Accordingly, consuming organic food also has a beneficial influence on attitudes towards the intention of consuming organic food. Furthermore, attitudes influence on consumers 'intentions to consume organic foods. Attitude is important so that it can affect the willingness of young adults to consume organic foods (Pham, Ninh Nguyen, Phan, Thanh Nguyen, 2019).

Perceived Behavioural Control

Perceived behavioral control is defined as a perception of the difficulty of formulating a behavior. However, perceived behavioral control can be considered a major latent variable. Perceived behavior is guided by three types of considerations namely behavioral beliefs, normative beliefs and control beliefs.

According to Ahmed et al. (2021), perceived behavioral control is the decision of young adults concerning their intention to consume organic foods in a particular behavior or not. Perceived behavioral control refers to the behaviors possessed by young people toward the intention to consume organic foods. Furthermore, many young adults have the intention of consuming organic foods as a result of behavior control situations that are perceived to affect them. Therefore, young adults who are unaware of the benefits of organic food intake end up being interested in trying organic food because of gaining awareness from this perceived behavioral control.

Subjective Norms

Subjective norm refers to the social pressure felt by a person to engage or avoid something (Chih-Ching & Yu-Mei, 2015). Subjective norms are also the belief that an important person or group of people will approve of and support certain behaviors. Thus, subjective norms have a significant impact on the engagement and desire of young adults to consume organic foods (Bai, Wang & Gong 2019). In this study, "subjective norm" refers to the social pressure on young adults to have the intention to consume organic foods. Ahmed et al., (2021) indicated subjective norms have a positive relationship with the intention to consume organic foods. The positive relationship of subjective norms has improved the perceptions of young adults.

Health Consciousness

Health consciousness is a consumer's understanding of changes in health status and the level of emphasis on health needs (Hsu, Chang, & Lin, 2016). Health consciousness also consists of sub-scales of health self-awareness, health involvement, health vigilance and health self-monitoring (Nagaraj, 2021). In this study, health consciousness refers to the lifestyle and health care of young adults who consume organic foods. Therefore, many people consume organic food because of health consciousness. According to Qasim, Yan, Guo, Saeed & Ashraf (2019), health consciousness has a significant relationship with the intention to consume organic food.

Environmental Concern

Environmental concern is defined as the extent to which people are aware of environmental issues and their willingness in solving environmental problems (Maichum, Parichatnon, & Peng, 2016). It is also one of the most important motivating elements to buy any item including organic food. In this study, environmental concern refers to the concern of caring for the environment and encouraging young adults to consume organic foods. In addition, environmental concerns will increase the consumption of organic food as well as the intention to consume organic foods. Specifically, environmental concern has a significant relationship with the intention to consume organic food (Yadav & Pathak, 2016).

Research Hypothesis

In the study, there were five related hypotheses to identify the relationship between attitude, perceived behaviour control, subjective norms, health consciousness and environmental concern in the intention to consume organic food among young adults. Based on the literature review discussed, the hypothesis of this study were summarized below:

H1   Attitudes have a positive relationship with the intention to consume organic food.
H2   Perceived Behavioral Control (PBC) has a positive relationship with the intention to consume organic food.
H3   Subjective Norms (SNS) have a positive relationship with the intention to consume organic food.
H4   Health Consciousness (HC) has a positive relationship with the intention to consume organic food.
H5   Environmental Concern has a positive relationship with the intention to consume organic food.

Research Framework

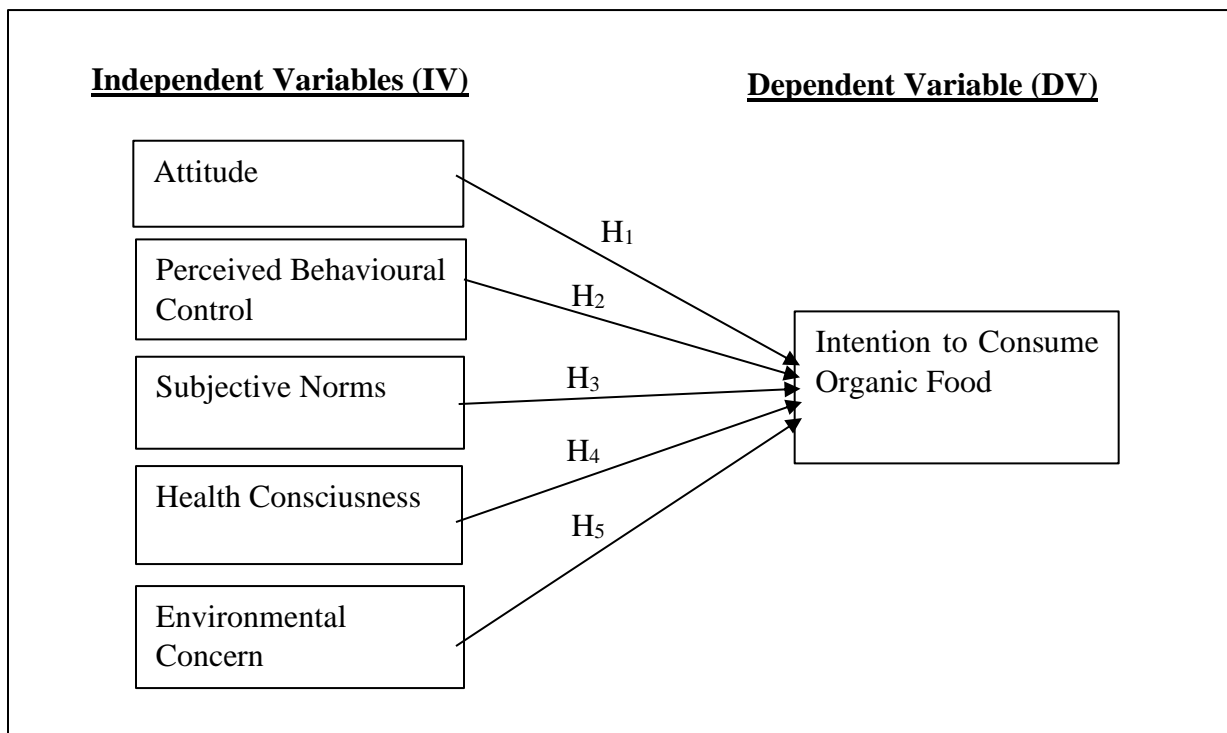
A research framework was conducted to investigate the relationship between independent variables and dependent variables. The independent variables are distinguished as attitude, perceived behavior control, subjective norms, health consciousness, and environmental concern and the dependent variable are the intention to consume organic food. Figure 1 below shows the research framework used for this study.


Figure 1: Research Framework

METHODOLOGY

Research Design

The study used a quantitative research approach by using a correlational cross-cross sectional research design. The data was collected using an online survey. According to Hair, Black, Babin, and Anderson, (2010), an online survey can help decrease errors during the process.

Data Collection

Google form was used to develop the online questionnaire. The weblink for the online questionnaire was then distributed via social media platforms, such as Facebook, and WhatsApp, and through personal contacts of the researcher. 324 respondents participated in this study. The questionnaires consist of three sections A, B, and C. Section A comprises socio-demographic questions such as gender, age, race, marital status, level of education and occupation. Section B and C consist of measurement of independent and dependent variables that use a 5-point Likert scale, ranging from 1 which strongly disagrees to 5 which strongly agree.

Sampling

Owing to the sampling frame's unavailability, the non-probability technique was used in this study using purposive. The researcher selected Malaysian consumers who are above 18 years old, and who expected to understand the concept of "green". The purposive sampling technique was suitable for this study because the respondents must fulfill certain criteria to be screened as respondents. Non-probability sampling techniques are suitable for studying theoretical impact based on conceptual frameworks (Hulland et al., 2017; Hayat, Ngah, Hashim, Dahri, Malik, & Rahayu, 2019). Because of the exploratory character of the study (Hair et al., 2017), the data were analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM) approach (Ringle, Wende, & Becker, 2015).

263

FINDINGS

Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Frequency Analysis

Characteristics	Frequency	Percentage (%)
Gender		
Male	98	30.2
Female	226	69.8
Age		
18-22	86	26.5
23-25	218	67.3
26-30	20	6.2
Race		
Malay	287	88.6
Indian	20	6.2
Chinese	13	4.0
Others	4	1.2
Marital Status		
Single	292	90.1
Married	28	8.6
Others	4	1.2
Level of Education		
SPM	25	7.7
STPM	0	0
Diploma	48	14.8
Degree	220	67.9
Master	31	9.6
PhD	0	0
Occupational		
Students	266	82.1
Employed	46	14.2
Self-employed	6	1.9
Unemployed	6	1.9

Table 1 shows the respondents among young adults in Malaysia; the majority were female (69.8%), and the remaining respondents (30.2%) were male. Regarding their age, the age of the respondents varied; between 18 and 22 years (26.5%) respondents, more than half of the respondents (67.3%) aged between 23 and 25 years, and 6.2% of respondents aged from 26-30 years. As for the respondents' races, most were Malay (88.6%) compared to Indian (6.2%), Chinese (4.0%), and others (1.2%). Concerning their marital status, 90.1% were single, 8.6% were married, and the remaining respondents were divorced (3.1%). In terms of the level of education, the respondents held an SPM (7.7%), with (14.8%) being Diploma holders, while more than half of the respondents held a Degree (67.9%). Only 9.6% of respondents held a Master's degree. Lastly, the descriptive analysis revealed that most of the respondents' occupation is students (82.1%) while 14.2% are employed by the government or non-government. The remaining 1.9% of the respondents are self-employed and 1.9% are unemployed.

Result of Descriptive Analysis

Descriptive statistics summarize how well respondent responds to questions presented in a questionnaire. As reflected in this study, Table 2 shows the results for the mean and standard deviation for the construct of the present study.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Attitude	I think that consuming organic food is a good idea.	4.23	0.831
	I think that consuming organic food is interesting.	4.11	0.845
	I think that consuming organic food is important.	4.14	0.861
	I think that consuming organic food is beneficial	4.18	0.828
	I think that consuming organic food is favourable	4.05	0.906
Perceived Behavioural Control	If I wanted to, I could take organic food instead of non-organic food	4.00	0.823
	I think it's easy for me to take organic food	3.76	0.910
	It is mostly up to me whether or not to take organic food	3.98	0.844
Subjective Norms	Most people I value would take organic food rather than non-organic food	3.74	0.947
	My family thinks that I should take organic food rather than non-organic food	3.85	0.935
	Most friends whose opinions regarding diet are important to me, think that I should take organic food	4.01	0.840
Health Consciousness	I choose food carefully to ensure good health	3.99	0.883
	I consider myself a health-conscious consumer.	3.98	0.885
	I often think about health-related issues	4.01	0.873
	I often dwell on my health.	4.06	0.890
	I think that I take health into account a lot in my life	4.05	0.814
Environmental Concern	I think that organic food is friendly to the environment	4.04	0.907
	I think organic farming avoids pollution	4.19	0.810
	I think no usage of chemicals in organic farming	4.03	0.929
	I think that major social change is necessary to protect the natural environment	4.20	0.839

			4.09	0.812
Intention to Consume Organic Food	I want to purchase organic food if they are available for purchase		4.09	0.812
	I want to consume organic food if they are available for purchase		4.10	0.777
	I intend to consume at least two servings of organic food per day		3.91	0.850
	I intend to consume at least two servings of organic food to have a balanced diet		4.00	0.820
	I intend to consume at least two servings of organic food to protect myself from being diagnosed with any medical condition		4.01	0.823
	I intend to consume at least two servings of healthy foods to maximize my health		4.05	0.797

The mean score obtained from a descriptive analysis is shown in table 2, above. To summarize, the highest mean score for an independent variable, attitude is 4.1426± 0.76925, followed by environmental concern (4.1138±0.74768), health consciousness (4.0190±0.76048), perceived behavioural control (3.9115±0.73189), and subjective standards (3.8673±0.79161). Thus, the mean score of the dependent variable is 4.0267±0.71109.

Result of Measurement Model Analysis

Table 3 below shows the measurement model of this research.

Table 3: Measurement Model (Convergent Reliability)

Constructs	Items	Loadings	AVE	CR
Attitude	ATT1	0.892	0.811	0.955
	ATT2	0.918		
	ATT3	0.916		
	ATT4	0.908		
	ATT5	0.868		
Perceived Behavioural Control	PBC1	0.875	0.724	0.887
	PBC2	0.848		
	PBC3	0.831		
Subjective Norms	SNS1	0.848	0.758	0.904
	SNS2	0.899		
	SNS3	0.863		
Health Consciousness	HC1	0.850	0.765	0.942
	HC2	0.866		
	HC3	0.887		
	HC4	0.893		
	HC5	0.876		
Environmental Concern	EC1	0.807	0.737	0.918
	EC2	0.902		
	EC3	0.860		
	EC4	0.862		
Intention to Consume Organic Food	INT1	0.852	0.764	0.951
	INT2	0.849		
	INT3	0.874		

INT4	0.889	
INT5	0.883	
INT6	0.895	

The measurement model can be confirmed valid and reliable if the loading is higher than 0.5, the average variance extracted (AVE) is higher than 0.5, and the composite reliability (CR) is higher than 0.7, respectively (Hair et al., 2017). Table 3 above clearly illustrates that all the requirements to establish convergent validity have been fulfilled; hence, the study concludes that convergent validity was not a problematic issue for the study. The summary of convergent reliability for the measurement model was summarized in Table 3.

Result of Discriminant Validity

Table 4 below shows the discriminant validity of this research.

Table 4: Discriminant Validity Analysis (Using HTMT Criterion)

	1	2	3	4	5	6
1.Attitude	■					
2.Environmental Concerns	0.729	■				
3.Health Consciousness	0.708	0.818	■			
4.Intention to Consume Organic Food	0.728	0.589	0.789	■		
5.Perceived Behavioural Control	0.818	0.824	0.879	0.863	■	
6.Subjective Norms	0.689	0.750	0.780	0.821	0.891	■

The discriminant validity analysis was used to confirm that the construct is statistically unique and differs from other constructs (Hair, Risher, Sartedt & Ringle, 2019). There are different measures of discriminant validity available for this analysis; however, Fornell-Larcker (Fornell & Larcker, 1981) and Hetrotrait-Monotrait ratio of correlations (HTMT: Henseler, Ringle, & Sarstedt, 2015) are of substantial importance. HTMT, as the latter is a relatively new method preferred to test the discriminant validity in PLS-SEM.

Following the previous PLS research by Buil, Martínez, and Matute (2019), the current study used the HTMT value to measure discriminant validity. In terms of the HTMT criterion, given that all values are less than 0.90 (Franke & Sarstedt, 2019). Table 4 above demonstrated the discriminant validity established from the HTMT criterion. It can be concluded that the respondents understood that the given constructs are distinct. These validity tests have shown that the measurement items are valid and reliable.

Result of Direct Hypothesis Analysis

Table 5 shows the result of the analysis between the dependent variable and independent variables. This analysis gives a significant and reliable measurement by using direct hypotheses.

Table 5: Direct Hypothesis

	Relationship	Std. Beta	Std. Error	t value	p-value	Confidence Interval		VIF	Decision
						LL	UL		
H1	Attitude→ Intention	0.125	0.061	2.074	0.019	0.026	0.226	2.334	Supported
H2	Perceived Behavioral Control →Intention	0.128	0.076	1.685	0.046	0.004	0.253	3.156	Supported
H3	Subjective Norms→ Intention	0.225	0.068	3.305	0.001	0.098	0.324	2.979	Supported
H4	Health Consciousness→ Intention	0.129	0.076	1.701	0.045	0.013	0.249	3.038	Supported
H5	Environmental Concern →Intention	0.369	0.077	4.798	0.000	0.234	0.500	2.613	Supported

Table 5 above shows that the first hypothesis, attitude was positively related to intention (ß = 0.125, t = 2.074, LL = 0.026, UL = 0.226, p-value < 0.05). The second hypothesis, perceived behavioural control was related to intention (ß = 0.128, t = 1.685, LL = 0.004, UL = 0.253, p-value < 0.05). Next, third hypothesis, subjective norms was positively related to intention (ß = 0.225, t = 3.305, LL = 0.098, UL = 0.324, p-value < 0.001). This is followed by the fourth hypothesis, health consciousness also related to intention (ß = 0.129, t = 1.701, LL = -0.013, UL = 0.249, p-value < 0.05). Lastly, fifth hypothesis environmental concern was positively related to intention (ß = 0.369, t = 4.798, LL = 0.234, UL = 0.500, p-value < 0.001). Table 4.6 below indicates that five direct hypotheses developed for the model were significant; thus H1, H2, H3, H4, and H5 were accepted and supported.

DISCUSSION AND RECOMMENDATION

The goal of this study is to determine the influence of attitude, environmental concern, subjective norms, perceived behavioural control, and health consciousness on the intention to consume organic food among young adults in Malaysia. The study contributes to the literature by examining and supporting the effects of the TPB variables, attitudes, and subjective norms on intentions to consume organic food, and exploring the other motivational factors. The outcomes of this study confirm that every variable has a strong predictor of intention to consume organic food among young adults in Malaysia. RQ1 was affirmed since the attitude to intention to consume organic food (H1) was supported. The finding confirms that attitudes are positively linked with organic food consumption (Larson, 2018).

The results of the hypothesis testing for the organic food products on the association between availability of intention to consume (H2) were supported. The findings are consistent with previous research, which revealed that perceived behavioral control is positively connected to the intention to consume organic food. This indicates that perceived behavioural control is a determinant of intention to purchase organic food (Shin, Im, Jung, & Severt (2018).

The hypothesis testing results for organic food items on the relationship between subjective norms and consumer intent (H3) was supported. The findings are consistent with previous research that revealed that subjective norms are positively connected to the intention to consume organic food (Chi et al., 2019; Abdullah Al-Swidi et al., 2014). According to Chi et

al. (2019), the subjective norm is a better predictor of young customers' purchase intentions for organic food and discovered minimal effects of the subjective norm on purchasing intention for environmentally sustainable items.

Next, the result revealed that there is a positive relationship between health consciousness and the intention to consume organic food (H4). According to Hsu et al., (2016), health consciousness also has a significant relationship with the intention to consume organic food. Also, there is a positive relationship between environmental concern and intention to consume organic food (H5). The findings are consistent with previous research. Environmental concern also has a significant and positive relationship with the intentions to consume organic food (Shamsudin et al., 2018).

Five of the model's direct hypotheses were found to be supported, hence H1, H2, H3, H4 and H5 were accepted. The findings of the study are also crucial for future research. As a result, it is suggested that future research investigates the knowledge of factors that influence organic food intention consumption by including more demographic characteristics of respondents, such as gender, age, marital status, level of education, and race, to generate different results or findings from various perspectives.

As for the recommendation, the type of respondents could be changed from young people in several states and divided into several urban centres in those states. This can help us identify the problem that affects the intention to consume organic food between them. Therefore, the scope of distribution of the questionnaire form should be bigger and not just focused on young adults. Thus, the results of the questionnaire will be more thorough and precise.

In addition, it is recommended to future researchers to have a longer time for the distribution of questionnaires so that researchers have more time to find who is more suitable and qualified to be a respondent. It is difficult to complete data collection in a short period for a sample size that will attended by 338 respondents. Next, the researcher can explain the purpose of the study to the respondent if the respondent finds something confusing in answering the question. They may need some better description and understanding so that the researcher has more accurate and reliable data. Thus, a study timeline needs to be added to allow researchers to do so more time to complete the test and be able to add more findings in research, especially during the Covid-19 pandemic. Therefore, the researcher may have more time to complete this study more perfectly and more organized.

CONCLUSION

The analysis revealed that attitude, environmental concern, subjective norms, perceived behavioral control, and health consciousness have a positive influence on the purchase intention of organic food among young adults in Malaysia. The findings are essential for the organic food manufacturers to craft a marketing strategy aimed at organic food consumers in Malaysia.

ABSTRACT

The paper investigates the relationship between the factors that influence the acceptance of the COVID-19 vaccine among residents in Kelantan. The questionnaire collected information is based on sociodemographic variables, health problems, lack of knowledge, and vaccination safety. The study uses a quantitative approach and about 384 online responses have been collected among residents in Kelantan. The data collection has been conducted between January and March 2022. The methodology analysis used is descriptive analysis and Pearson Correlation analysis. Based on the data analysis and findings, the most significant factor is health problems, which achieved the highest mean score of 3.9378. The result of this study contributes to higher education for improving the factors that influence the acceptance of the COVID-19 vaccine.

Keywords: COVID-19 vaccine, immunization, vaccine acceptance; vaccine preference

INTRODUCTION

This study analyses the factor that influences the acceptance of the COVID-19 vaccine among residents in Kelantan. In the year 2019, the world must face the greatest global health crisis, coronavirus disease (COVID-19) which has affected wide-reaching economic, social, and environment. The COVID-19 pandemic crisis occurred in Wuhan City, Hubei Province, China in December 2019 originating from Hunan South China Seafood Market and the pandemic has spread to the world including Malaysia (Guo Y, Cao Q, Hong Z, et al., 2019). Undeniably the COVID-19 disease crisis spread more rapidly in countries close to China such as Korea, Thailand, Singapore, Japan, Italy, Iran, Spain, the UK, and other countries that have been classified by WHO (World Health Organization, 2020). As of April 7, 2020, as a result of reports from across the country, the total number of COVID-19 cases was 2,230,439, while the total number of deaths was 150,810 and a total of 564,210 recovery cases were recorded (World Meters, 2020).

Besides, several COVID-19 preventive vaccines are now under development; however, nothing is known regarding the public acceptance of such a vaccination. (Front Med., 14 (2), 2020). With the rise in COVID-19 cases around the world, vaccinations against the virus are being developed in a variety of countries. The general public's acceptance of the COVID-19 vaccine is debatable. People have been perplexed by the wide range of COVID-19 immunization alternatives available, raising questions about the efficacy and safety of specific immunizations. (Front Public Health, 8, 2020). Due to safety concerns, vaccine efficacy, misinformation, religious views, and income levels, vaccination coverage has been dropping in several countries in recent decades. (Figueiredo et al., 2016, 2020; Malesza, 2020; WHO, 2020). Misinformation, conspiracy theories, and mistrust have recently been highlighted as potential variables that may influence people's decision not to vaccinate against COVID-19 (Burki, 2019; Guidry et al., 2020; Islam et al., 2021; Roozenbeek et al., 2020).

A total of 10,000 people in Kelantan did not show up at the vaccination centre to get vaccinated according to the appointment set by the Ministry of Health Malaysia, making the community online confused and wondering why it happened (The Star, 2021). On 14 Sep 2021, Ahmad Fadhli Shaari (PAS-Pasir Mas) stated that Kelantan is one of the states that received the least vaccination rate and only 50% had received the COVID-19 vaccination. In addition, the 729th death toll on 29 January 2021 was reported to be the death of a COVID-19 patient that occurred at the Raja Perempuan Zainab 2 Hospital, Kota Bharu, Kelantan. The patient was a 63 -year - old woman with a background of chronic diseases such as diabetes, high blood pressure, and dyslipidemia (Director-General of Health, 2021). Besides, the other 15 death cases that happened in different states, such as Selangor, Sarawak, Perak, Sabah, Melaka, and Wilayah Persekutuan are patients who have a bad health background. However, it can be seen that some people do not want to receive the COVID-19 vaccine due to a lack of knowledge about the effectiveness and advantages of the vaccine. Therefore, according to Professor Dr. G. Jayakumar of Manipal University College Malaysia Community and Occupational Medicine, the Health Ministry and the Occupational Safety and Health Department need to step up their health education and enforcement efforts. Thus, the lack of knowledge about the COVID-19 pandemic has made the public wary of the safety of the vaccine.

This study consists of three objectives:
1. To examine the influence of health problems on Kelantan's inhabitants' approval of the COVID-19 immunisation.
2. To investigate the influence of lack of knowledge about COVID-19 vaccine acceptance among residents in Kelantan.
3. To investigate the influence of the vaccination safety on Kelantan residents' approval of the COVID-19 immunisation

Significance of The Study

Acceptance

Acceptance is a term used in human psychology to describe a person's agreement with the reality of a situation, accepting that a tactic or scenario is usually harmful or unpleasant. When a person to whom a suggestion is made displays acquiescence, it is an acceptance of their approach, which is also known as an agreement.

Covid 19 Vaccine

Vaccines for COVID-19 let patients develop immunity to the disease-causing virus without getting sick. Different immunizations give protection in different ways. The three types of vaccines are RNA vaccines, protein subunit vaccines, and vector vaccines. To be completely immunised, two or one doses of the COVID-19 vaccine are necessary. Two doses are required for Pfizer-BioNTech and Sinovac vaccines. The covid vaccine requires single shot are Johnson & Johnson and Janssen.

Health Problem

A health problem is a state of not being able to function normally and without pain. Health is a state of complete physical, mental, and social well-being, not only the absence of sickness or illness. Mental and physical health are the two types of health that are usually emphasised. Spiritual, financial, and emotional well-being are all part of total wellness. Medical experts have connected them to lower stress levels and enhanced mental and physical well-being.

Knowledge

Ignorance is a lack of knowledge on a significant level. Naivety due to lack of knowledge or training or it can be said to be ignorant. Knowledge failure happens when people have inaccurate, incomplete, uncertain, or misconstrued data and so make potentially wrong choices.

Vaccination Safety

Vaccination safety is a significant part of the nation's response to the COVID-19 pandemic. Vaccines have strict measures in place to guarantee that they are all safe. In the United States, the immunisation supply is the safest it has ever been. Before receiving WHO and national regulatory approval, vaccines must undergo thorough testing in clinical trials to ensure that they meet globally recognised safety and effectiveness standards.

LITERATURE REVIEW

Health Problem

These challenges might have a wide range of effects on people's mental health, necessitating the attention of global health researchers and practitioners. Depression, anxiety disorders, drug misuse, increased suicidal impulses, and PTSD have all been linked to large economic downturns or natural disasters in the past. If the COVID-19 pandemic follows the same course, the psychological impacts of prolonged stress on the general population, as well as the deterioration of various mental health conditions among those who are vulnerable, would add to the current healthcare system's load. It may also delay resuming regular life for many people when the physical threat of viral infection eventually passes. The disruption of everyday life caused by government-imposed lockdowns or stay-at-home orders has had a substantial negative impact on individuals affected mental health. (Md Mahbub Hossain and Samia Tasnim, 2020).

The psychological repercussions of the epidemic are gradually being recognised in scholarly literature, in addition to the physical health, economic, and societal implications. The COVID-19 scientific publications on the epidemiology of mental health problems were the topic of this narrative evaluation. According to current evidence, people infected with COVID-19 are more likely to suffer from depression, anxiety disorders, stress, panic attacks, irrational anger, impulsivity, and somatization disorder, as well as sleep disorders, emotional disturbance, posttraumatic stress symptoms, and suicidal behaviour. (Hossain and Samia Tasnim, 2020).

Lack of Knowledge

Misinformation about the benefits, medicinal composition, and adverse effects of vaccination is one of the barriers to universal vaccination, and the rise in anti-vaccination sentiment is largely due to the belief that vaccinations cause more harm than good in children, particularly in cases where vaccination is linked to autism. Furthermore, the eradication of some serious infectious illnesses as a result of vaccination diminishes public incentive to take vaccines under the pretext that diseases have been eradicated. One reason for not taking vaccines, which is especially crucial in the COVID-19 pandemic, is the belief that immunization is unnecessary because good hygiene measures can suffice. Because of previous experience with immunization's success in preventing a variety of serious infectious diseases, vaccine research and vaccination as the most important epidemiological measure were given considerable confidence.

In December 2020, many vaccines to prevent COVID-19 infection were authorized, and more than 50 COVID-19 vaccine candidates were being developed. Vaccination has begun in several countries throughout the world, with Jordan following suit in February 2021. Nonetheless, certain cases of reinfection have been reported, raising questions about vaccination safety and

efficacy, particularly in terms of COVID-19 protection. Furthermore, the quick development of vaccines raises worries regarding their safety. Previously, rapid vaccine development was connected with unfavourable outcomes. The swine flu vaccine, for example, raised the risk of Guillain-Barré syndrome. (Al-Qerem WA & Jarab AS (2021).

Vaccination Safety

Many of the new vaccines make use of completely new technologies that have never been used in humans before. The justification for this action was that the outbreak was so widespread and devastating that it necessitated drastic measures. In due course, the SARS-CoV2 immunization program commenced. The majority of them have been the vector vaccination product created by the Oxford vaccination group and marketed by AstraZeneca, Vaxzervria, BioNTech's RNA vaccination product marketed by Pfizer, and Vaxzervria, the RNA vaccination product developed by BioNTech and marketed by Pfizer. Other immunizations account for just approximately 5% of overall immunizations. Because these vaccines have never been evaluated for safety in prospective post-marketing surveillance studies, all agreed that determining their efficacy and comparing them to the standard of care would be beneficial Harald Walach et al, 2021). Clinical pharmacists were crucial in the safety monitoring of the COVID-19 vaccine. The inactivated COVID-19 vaccination has a high level of safety. The majority of the prevalent side effects were minor and acceptable, with a low occurrence. Clinical pharmacists' work is crucial and can be expanded in the future to assure immunization safety and provide improved health care (Guangfei WangLin Zhu, 2021).

Vaccines have also played an important role in improving health outcomes and life expectancy by controlling and preventing infectious diseases including smallpox, polio, and plague. The development of a safe and effective COVID-19 vaccine is a critical step toward containing the pandemic, given the increased morbidity and death associated with COVID-19. However, once the vaccines are available, misinformation and conspiracy theories surrounding COVID-19 immunizations can have a major impact on vaccine uptake. (

Acceptance of COVID-19 Vaccine

Vaccine acceptance can be influenced by a wide range of factors. The effect of perceived risk, vaccination efficacy, availability of information, and job type on vaccine uptake has been studied in some research. The goal of this study is to see if there is a significant difference between people who have an excellent, good, fair, and vague knowledge of COVID-19 in terms of depression, anxiety, stress, mindfulness, specific cognitive emotion regulation strategies, and psychological flexibility, and to see if there is a significant relationship between these variables. (Priyanka Podder and Neha Dubey, 2020).

According to the study, the higher one's ability to be mindful of oneself and activities is proportional to one's ability to be present at the moment, open to new experiences, and work with awareness. In the context of the COVID-19 pandemic, the current study findings imply that the more one acts with awareness, the better one's knowledge of the pandemic, understanding of the unique virus, its infectious nature, and the safety measures required to avoid transmission to self and others. The more one can acknowledge their pandemic-related feelings and how it feels to respond adaptively to those feelings without ignoring them, the more one can stay present at the moment. (Priyanka Podder and Neha Dubey, 2020).

Research Hypotheses
H1   There is a significant influence of the health problem on the acceptance of vaccination of Covid-19 among residents in Kelantan.

H2   There is a significant influence of lack of knowledge about the acceptance of the COVID-19 vaccine among residents in Kelantan.

H3   There is a significant influence on vaccination safety and the acceptance of the COVID-19 vaccine among residents in Kelantan.

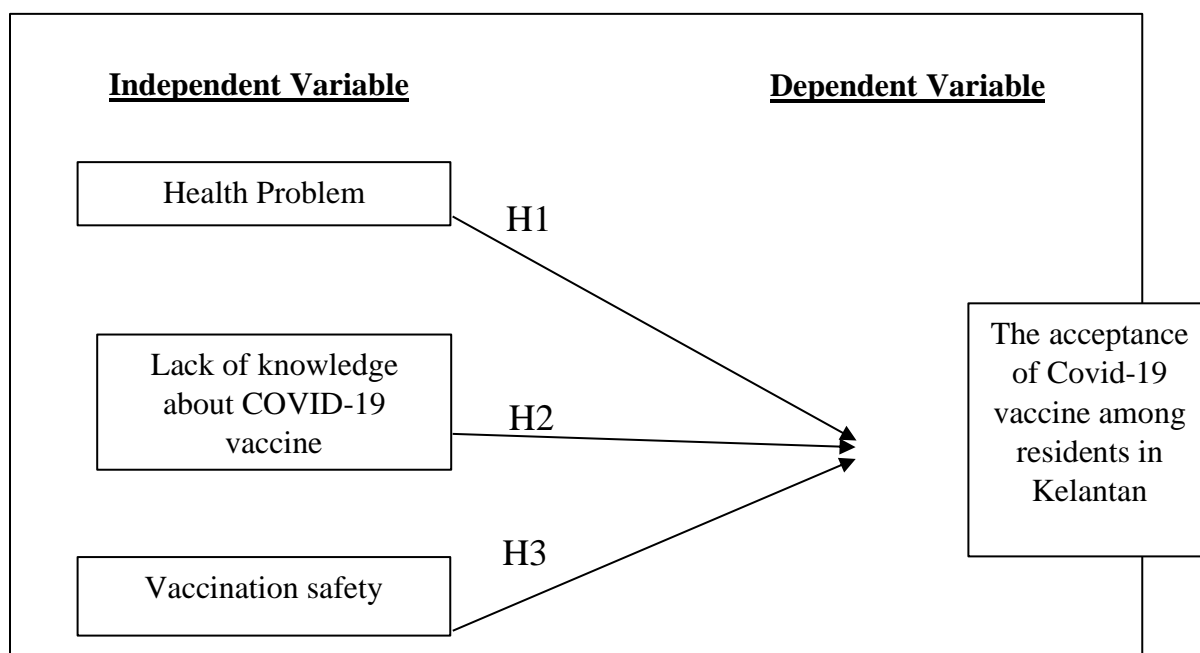
Figure 1 below represents the conceptual framework of this research.


Figure 1: Research Framework

METHODOLOGY

Research Design

The study used the quantitative method where questionnaires were distributed to 384 people in Kelantan. In this research, the target population chosen was Kota Bharu, Kelantan. The reason why the researcher chooses Kelantan state to do this research topic is that Kota Bharu is at a rank of 10th in the list of the largest cities in Malaysia with a population of some 600,000. Researchers want to study the factor that influences the acceptance of the COVID-19 vaccine among residents in Kelantan.

Moreover, a set of questionnaires was distributed to the population to collect the data. The researcher divided the questionnaire into 3 sections which are Section A, B, and C. For Section A, the questionnaire requested general information about the factors that influence the acceptance of the COVID-19 vaccine among residents in Kelantan. Section A discussed the respondent's demographic information such as gender, age, race, income level, status, education level, and type of job. Section B discussed focused on the independent variables which are boosting employee morale, reducing absenteeism, and increasing employee productivity, consisting of questions related to the independent variable meanwhile section C discussed the dependent variable which is the Factors that influence the acceptance of COVID-19 vaccine among residents in Kelantan.

Data Collection

The data collection was conducted using questionnaires. This study chose to distribute the questionnaires using the google form application. The survey was applied to collect information concerning the acceptance of the COVID-19 vaccine among residents in Kelantan. The survey will conduct online due to the current pandemic issue in Malaysia which is COVID-19.

Sampling

The sampling method used in the study is the simple random sampling method. Simple random sampling is employed to create statistical assumptions about a population. The study used this

method because questionnaires were prepared and distributed on online pages to gather information from the respondent.

$$n = \frac{X^2 Np(1-p)}{e^2(-1) + X^2 p(1-p)}$$

n = sample size
N = population size
e = acceptable sampling error
X^2 = chi-square of degree of freedom 1 and confidence 95% = 3.841
P = proportion of population (if unknown, 0.5)

Data Analysis

Three types of data analyses were used in this study, namely frequency analysis, descriptive analysis, and person correlation analysis. The collected data were analysed by using Statistical Package for the Social Sciences (SPSS) version 26.

FINDINGS

Results of Demographic Analysis

Table 1 shows the data of demographic analysis obtained from Part A in the questionnaire on demographic variables include gender, age, status, level of education, and the race taken in Kelantan. The population for the research is from the state of Kelantan. Table 4.1 shows the result of socio-demographic characteristics of the respondents. Our research focuses on the population in Kelantan and the majority of respondents were female (63.5%), aged 21 years and above (68.0%), single (80.5%), and level of education was degree (52.3%), and the last one is race Malay (81.3%).

Table 1: Descriptive Analysis

Socio Characteristic		Frequency	Percentage (%)
Gender	Male	140	36.5
	Female	244	63.5
Age	12 - 17 years old	5	1.3
	18 – 20 years old	118	30.7
	21 years old and above	261	68.0
Status	Single	309	80.5
	Married	72	18.8
	Others	3	0.8
Level of education	SPM	38	9.9
	Diploma	63	16.4
	Degree	201	52.3
	Master	26	6.8
	PHD	11	2.9
	Others	45	11.7
Race	Malay	312	81.3
	Indian	33	8.6

Chinese	32	8.3	
Other	7	1.8	

Result of Descriptive Analysis

Table 2 shows the question of health problem that contributed to the acceptance of COVID-19 vaccine by our respondents. Based on our research, the highest value of mean is "The COVID-19 vaccine is essential to increase antibodies in the body" with 4.4792, followed by "The COVID-19 vaccine boosts the immune system in the body" (4.2865), "Covid19 vaccine has side effects" (4.2031), "Administration of COVID-19 vaccine can break the transmission chain more efficiently" (4.0781), "People with health problems are at risk of receiving COVID-19 Vaccine" (4.0547), "The COVID-19 vaccine can affect internal health" (3.5911), "Does vaccination make the body weaker" (3.4193) and the last is that "The COVID-19 vaccine is detrimental to internal and external health" (3.3906). Then, demonstrated the mean and ranking for lack of knowledge. The highest mean represented the question of "Fake news about vaccines makes me afraid of vaccines (3.3073)", followed by "When the vaccine stops the pandemic, I won't need to be vaccinated" (2.9661), "I don't think I'm going to get sick even if I don't get the vaccine" (2.8880), "I don't want to waste time on vaccination, I have more important worries" (2.8125), "I don't expect severe symptoms so there is no need to get the vaccine" (2.7943 "The sharing about the COVID-19 vaccine is not very widespread" (2.6667), "I have less exposure to the COVID-19 vaccine" (2.5495) and second last is "I was already COVID-19 positive, so I will definitely not be positive again" (2.4505), and last ranked is " I don't care if I get sick" (1.9193). Besides, the table also represented the mean of vaccination safety. The question which dominates the first ranked with the highest mean is "I believe in the effectiveness of the vaccine" (4.0469) and followed by "I think the vaccine will protect me from getting sick" (3.8721), "I think the COVID−19 vaccine is safe" (3.8668), "I am not sufficiently informed about the COVID-19 vaccines" (2.8542), next is "I am afraid of the side effects of the vaccine" (3.7891), "I will accept the next vaccination" (3.6432), the last one is "I believe that traditional medicine is suitable for COVID-19 cure instead of taking a vaccine" (3.3516). Lastly, the next row represented the mean of Satisfaction with COVID-19 vaccine. The question which dominates the first ranked with the highest mean is "After receiving the COVID-19 vaccine can go to the workplace, school, and outdoor activities" (4.2161), followed by "I would recommend getting the COVID-19 vaccine to others" (3.9115), is "COVID-19 vaccine safe for my health" (3.9063), "General comfort with receiving vaccination in the COVID-19 vaccine centre" (3.8984), "COVID-19 vaccines satisfied me" (3.6536), "COVID-19 Vaccines can prevent me from COVID-19" (3.6146), and last is "I would accept more accept vaccines for myself to boost my immunity system" (3.5885).

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Health Problem	The COVID-19 vaccine is essential to increase antibodies in the body	4.4792	0.765
	COVID-19 vaccine has side effects	4.2031	0.923
	The COVID-19 vaccine boosts the immune system in the body	4.2865	0.847
	The COVID-19 vaccine can affect internal health	3.5911	1.168
	People with health problems are at risk of receiving COVID-19 Vaccine	4.0547	1.004
	The COVID-19 vaccine is detrimental to internal and external health	3.3906	1.196

	Administration of COVID-19 vaccine can break the transmission chain more efficiently	4.0781	0.939
	Does vaccination make the body weaker	3.4193	1.292
Lack of Knowledge	I have less exposure to the COVID-19 vaccine	2.5495	1.330
	The sharing about the COVID-19 vaccine is not very widespread	2.6667	1.328
	I don't think I'm going to get sick even if I don't get the vaccine	2.8880	1.315
	I was already COVID-19 positive, so I will definitely not be positive again	2.4505	1.324
	When the vaccine stops the pandemic, I won't need to be vaccinated	2.9661	1.309
	I don't expect severe symptoms so there is no need to get the vaccine	2.7943	1.289
	I don't want to waste time on vaccination, I have more important worries	2.8125	1.385
	I don't care if I get sick	1.9193	1.273
	Fake news about vaccines makes me afraid of vaccines	3.3073	1.370
Vaccination Safety	I believe in the effectiveness of the vaccine	4.0469	0.963
	I am afraid of the side effects of the vaccine	3.7891	1.119
	I think the vaccine will protect me from getting sick	3.8721	1.057
	I think the COVID−19 vaccine is safe	3.8668	0.984
	I am not sufficiently informed about the COVID-19 vaccines	2.8542	1.309
	I will accept the next vaccination	3.6432	1.235
	I believe that traditional medicine is suitable for COVID−19 cure instead of taking a vaccine	3.3516	1.202
Acceptance of COVID−19 vaccine	Accept more vaccines for me to boost my immunity system	3.5885	1.242
	Accept more COVID-19 vaccines satisfied me	3.6536	1.085
	COVID-19 Vaccines can prevent me from COVID-19	3.6146	1.128
	General comfort with receiving vaccination in the COVID-19 vaccine centre	3.8984	0.957
	recommend getting the COVID-19 vaccine to others	3.9115	0.992
	COVID-19 vaccine safe for my health	3.9063	0.978
	After receiving the COVID-19 vaccine I can go to the workplace, school, and outdoor activities	4.2161	0.955

Result of Reliability Analysis

Based on Table 3, shows the reliability analysis for health problems. Cronbach's Alpha coefficient shows the value is 0.724. Next, is the reliability analysis for lack of knowledge. Cronbach's Alpha coefficient shows the value is 0.859. Also, the reliability analysis for vaccination safety. Cronbach's Alpha coefficient shows the value is 0.654. Meanwhile, the Satisfaction of COVID-19 Vaccine Cronbach's Alpha coefficient shows the value is 0.904. The questionnaire is reliable and can be used in the study. The result of reliability analysis for all the variables is 0.724, 0.859, 0.654, and 0.904. Based on (Bond & Fox, 2015), an acceptable Cronbach's Alpha value score is 0.71-0.99.

Table 3: Reliability Analysis

Variables	Cronbach's Alpha	No. of Items
Health Problem	0.724	8
Lack of knowledge	0.859	9
Vaccination safety	0.654	7
Satisfaction of COVID-19 Vaccine	0.904	7

Result of Pearson Correlation Analysis

Table 4 shows the results of the correlation analysis of the factor that influence the acceptance of the COVID-19 vaccine among residents in Kelantan. According to the results, the significant p-value of H1 is 0.001 which is below 0.05 and the p-value is under 0.05. Health problems and the acceptance of the COVID-19 vaccine were significantly correlated with $r = 0.268$, $p < 0.05$. There was a low correlation between health problems and the acceptance of the COVID-19 vaccine. Then, there is no significant correlation between lack of knowledge and the acceptance of the COVID-19 vaccine, with $r = 0.060$, $p < 0.05$. The correlation indicates that there is no relationship between lack of knowledge and the acceptance of COVID-19 vaccine and fails to reject the null hypothesis. Besides, there was a significant correlation between vaccination safety and the acceptance of COVID-19 vaccine, with $r = 0.662$, $p < 0.05$. There was a moderate positive correlation between health problems and acceptance.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H1 There is a significant influence of the health problem on the acceptance of vaccination of COVID-19 among residents in Kelantan.	0.05	H1 is supported
H2 There is a significant influence of lack of knowledge about the acceptance of COVID-19 vaccine among residents in Kelantan.	0.05	H2 is not supported
H3 There is a significant influence on vaccination safety and the acceptance of COVID-19 vaccine among residents in Kelantan.	0.05	H3 is supported

DISCUSSION & RECOMMENDATIONS

The research had shown that the variables are the acceptance of the COVID-19 vaccine among residents in Kelantan (dependant variables) and health problems, lack of knowledge, and vaccination safety (independent variables) were moderately correlated with the dependant variable and had a significant correlation relationship.

Based on the data analysis and findings, the most significant factor is a health problem, which achieved the highest mean score of 3. 9378 and followed by vaccination safety and lack of knowledge. All COVID-19 vaccines have been approved by WHO for emergency use listing that has been through randomized clinical trials to test every vaccine base on their quality, safety, and efficacy. The high efficacy rate of the vaccine is 50% and above only will be approved. Then it will be continuing to be monitored for ongoing safety and effectiveness. Besides, the COVID-19 vaccine also offers strong protection to increase antibodies in the body. However, this protection takes time to build. Therefore, all the required doses need to be taken to build full immunity. In other words, vaccines can stop someone from getting sick with COVID-19, but not everyone.

For recommendations, residents of Kelantan should take an action by filtering carefully what they are reading and believing in certain information including the information of the COVID-19 vaccine. The Malaysian population was found to have good knowledge, attitude, and perception regarding COVID-19 prevention. Besides, the Ministry of Health Malaysia should have scaled up the vaccine promotional programs, particularly through social media and mass media. Thus, more dialogues and forums involving experts from the ministry and universities have frequently been aired on television and Facebook Live. At the beginning of the mass vaccination program, the media also need to highlight the vaccination process of the top leaders to increase public confidence.

Then, future research on this topic may use the quantitative method instead of the qualitative method to collect data from all respondents. The quantitative method is better and more effective than the qualitative because the chosen population is based on the number of residents in Kelantan, which has a total of a million numbers. Next, for this study, the data was collected through an online survey questionnaire using Google Form. Therefore, future research is recommended to use the same way to get information from the respondent. Google Forms is widely being used nowadays to create surveys simply and efficiently. It is also a free online tool that allows the user to get systematic and excellent data. Besides, a face-to-face interview or online interview may be done by the future researcher to get more relevant, and reliable data based on the direct interview.

CONCLUSION

In conclusion, this study has been accomplished to discover the acceptance of COVID-19 vaccines among Kelantan residents. Three independent variables, health problems, lack of knowledge, and vaccination safety were chosen to examine their relationships with the dependent variable, which is the acceptance of the COVID-19 vaccine among Kelantan residents. Total 384 respondents from age 12-21 years old above in Kelantan to examine the acceptance of the COVID-19 vaccine among Kelantan residents. Based on Pearson correlation analysis, health problems and the acceptance of the COVID-19 vaccine were significantly correlated with $r = 0.268$, $p < 0.01$. There was a moderate strength of correlation between health problems and acceptance. Then, there was a significant correlation between lack of knowledge and the acceptance of COVID-19 vaccine, with $r = 0.060$, $p < 0.01$. The correlation indicates that there is a low relationship between lack of knowledge and the acceptance of the COVID-

19 vaccine. Besides, there was a significant correlation between vaccination safety and the acceptance of COVID-19 vaccine, with r = 0.662, p < 0.01. There was a moderate strength of correlation between health problems and acceptance. Therefore, all the hypotheses are supported.

Factors That Influence Weight Gain Among Year 3 UMK Students of City Campus

Alif Rodzuan, Thivya Shamugam, Huda Sabila Salbani, Aisyah Yahaya & * Nursalihah Ahmad Raston

Faculty of Hospitality, Tourism-and-Wellness, Universiti Malaysia Kelantan

Coresponding: email: nursalihah.ar@umk.edu.my

ABSTRACT

Weight gains may influence the changes in environmental barriers, perception of lack of healthy food and lack of physical activities. Many preventive measures have been implemented in response to the factors that influence weight gain among Year 3 students in city campus. University Malaysia Kelantan. As a result, the lifestyle is disrupted, which may have an influence the 'Weight Gain'. The data for the study was collected through a survey with 278 respondents, all of whom were recognised, including the year 3 students of University Malaysia Kelantan as well. The findings indicated that the lack of healthy food option factor had the greatest influence on the City Campus year 3 students of University Malaysia Kelantan. Data were analysed by descriptive analysis, frequency, and inferential analysis through Statistical Package for Social Sciences (SPSS) version 27.0.

Keywords: Weight gain, Environmental Barriers, Perception of lack of healthy food and Lack of physical activities.

INTRODUCTION

According to data issued by the World Health Organization, there has been an alarming rise in weight gain. Hyperplasia or hypertrophy of adipose cells in infancy causes an aggravated increase of fat tissue. This is a hallmark of obesity and tends to last into maturity. An insult or stimulus during crucial phases of development, such as intrauterine growth and infancy, has long-term impacts on the organism's physiology, structure, and functions. (M R Sacco, N P de Castro, 2013). Weight change, on the other hand, does not always match predictions based on energy imbalance calculations.

Obesity is linked to energy conservation (with weight loss) and dissipation, as well as intentional (like dieting) and involuntary weight reduction. Adaptive thermogenesis (AT) prevents energy storage from changing in response to changes in energy intake and/or EE. (Manfred J. Muller, Janna Enderle et al., 2016). Wellness is a comprehensive approach to well-being that feeds the body, stimulates the mind, and nourishes the spirit. It is a way of life that helps to grow into the best kind of person of potentials, circumstances, and fate will allow.

Dietary and nutritional habits are crucial for maintaining good health and avoiding sickness. Obesity can result from improper eating habits, which can severely impact on physical and psychological development. Poor eating habits and lack of physical activity can lead to osteoporosis, obesity, hyperlipidemia, diabetes, and cancer later in life. Nutrition education is still infrequently employed by university students. The effectiveness of nutrition education initiatives in changing dietary habits is unknown. This study examines the influence of various nutrition education interventions on the eating patterns of college students. (Lua, Elena et al., 2012; Ruben Navarrette, 2012).

The high prevalence of overweight and obesity among teenagers is one of the most serious health concerns. Obesity in children and adolescents has several short- and long-term consequences, including behavioral challenges, low self-esteem, and clinical diseases such as asthma and type 1 diabetes.

There were three objectives of this research:
1. To examine the influence of environmental barriers on weight gain among year 3 Universiti Malaysia Kelantan students city campus.
2. To identify the influence of perception of lack of healthy food options on weight gain among year 3 Universiti Malaysia Kelantan students city campus.
3. To investigate the influence of lack of physical activities on weight gain among year 3 University Malaysia Kelantan students' city campus.

Significance of Study
Researchers
This study aimed to give better information and enlighten new researchers about the entire extent of available data. This study also supplied new resources, expertise, and the most up-to-date information on the elements that could influence weight gain among year 3 University Malaysia Kelantan students on the city campus for future investigations. In Malaysia, women are fatter than males, while Malays and Indians are more obese than Chinese. The Orang Asli (Aborigines) are Malaysia's least obese ethnic group, although this may change as the country's economy develops. Obesity is not protected by living in a rural region or having a low income.

Authorities
The following importance of this study is for authorities. This report aimed to provide specific information to the authorities on weight gain in Malaysia. This research would provide the authorities with information about how to handle the way to eliminate weight gain. For example, in Malaysia, the government has started to take a closer look at the establishing of a National Plan of Action for Nutrition of Malaysia III 2016-2025. This is because the initiative to set up This Plan brings together nutrition-related actions to halt the rise in overweight, obesity and diet-related Campaigns, programs, and others can raise awareness among the government and the community.

Consumers
This study was also significant for the consumers. Since consumers or communities were significant contributors to weight gain, several studies looked at consumer or community weight gain during the covid-19 pandemic, and people use the application to buy goods as well as food. This is because it can avoid being exposed to the outside. In addition, it makes it easier for them. Students also spend a lot of time at home with online learning. The community needs to change their behaviors, including their routine, and manage diet plans. This study was also of considerable interest to society to help them become more concerned with weight gain. The importance of this study was to lead in minimizing weight gain consumption.

LITERATURE REVIEW
Weight Gain
More weight is acquired when people eat more calories than the body uses via normal biological activities and physical activity. However, the practices causing a person to acquire weight aren't always visible (Causes Obesity, 2019). Losing weight entails consuming fewer calories and exercising more. A person could become overweight or obese if enough weight is gained because of increasing body fat deposits, which is described as having more fat mass (adipose

tissue) than is healthy. The Body Mass Index (BMI) is a ratio that assesses body weight about height and identifies ideal, inadequate, and excessive weight

Obesity is a term used to describe a person who has gained excessive weight (William C.Shiel Jr., 2019). Obesity is a complex condition marked by an excessive amount of body fat. Obesity is more than just a matter of appearance. It is a medical condition that increases the risk of developing heart disease, diabetes, high blood pressure, and some cancers, among other diseases and health problems. For a range of reasons, some people have difficulty reducing weight.

Environmental Barriers

The barrier is one of the weight increase outcomes of year 3 students at the University Malaysia Kelantan, City Campus. Environmental factors such as high-fat foods, super-sized servings, and fast-food intake among students increase obesity. Students are addicted to high-fat, high-calorie items that are also tasty and inexpensive. One of the things that influence weight gain is behavior. Furthermore, one of the issues covered in the category of environmental barriers to students is stress. Because they are so concentrated on completing the project, pupils will be too stressed to go out and undertake physical activities. As a result, because these students are so concentrated on their tasks that they disregard their health, they acquire weight (Wetzel, 2021).

Students' decisions may be influenced by their surroundings or communities. Because there are not enough sidewalks, a person can decide not to walk to the shop or to work. Individuals' health decisions are influenced by their communities, homes, and workplaces. Because of this effect, it is critical to develop surroundings in these sites that encourage physical activity and a nutritious diet. Parks, trails, and walkways, as well as leisure and fitness facilities, may be available to encourage physical activity.

Lack of Healthy Food Options

Healthy eating habits and insufficient nutritional intake were emphasized among university students in 2011 (Gunasegaram, 2012). The study indicated that young individuals needed to be encouraged to adopt more appropriate eating habits to reach good nutritional status. Malaysian teenage females were found to engage in harmful eating behaviors such as skipping meals, particularly breakfast, snacking, and a variety of weight reduction dietary behaviors (Chin & Nasir, 2009)

Examples of findings from previous studies, most of the participants in this research ate fast food monthly, especially those aged 24 and younger. Similarly, 84 per-cent of Malaysian university students eats fast food. The prevalence of fast-food eating is concerning. Although most people in this poll said they ate at a restaurant, the availability of home delivery services by most fast-food companies has improved community access to fast food. As a result, fast food is now conveniently accessible without leaving the house. A product's accessibility, availability, and price significantly impact increased consumption. In terms of ethnicity, we discovered that Malays were more likely to consume fast food (Abdullah, Mokhtar, et al., 2014)

Lack of Physical Activities

According to the Department of Health and Social Care, students should engage in at least 150 minutes of moderate-intensity aerobic activity per week, such as cycling or quick walking. That does not have to be completed entirely at once; it can be broken down into smaller parts. For example, five days a week, a person could work out for 30 minutes (Causes Obesity, 2019).

Students are so preoccupied with academics and assignments that they overlook engaging in physical activity to preserve their health. Students are so engrossed in their electronics that they refuse to engage in physical activity, impacts on their weight and health. A lack of physical activity can lead to heart disease even if there are no other risk factors. Heart disease is caused by obesity, high blood pressure, excessive cholesterol, and type 2 diabetes. (Promotion, 2019).

Research Hypothesis

In this study, the following three hypotheses were indicated based on the research objectives:

H1: Environmental barriers have a relationship with weight gain among year 3 University Malaysia Kelantan students City Campus.
H2: Perception of lack of healthy food options is related to weight gain among student's year 3 University Malaysia Kelantan students City Campus.
H3: Lack of physical activity correlates with year 3 University Malaysia Kelantan students City Campus.

Research Framework

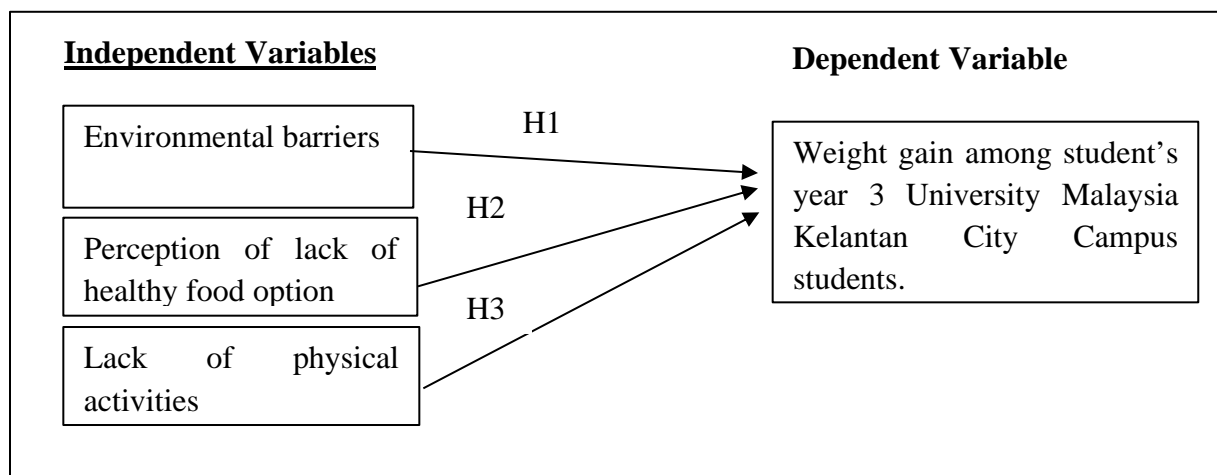
A research framework has been developed to investigate the connection between the research variables. The study's dependent variable is weight gain among year 3 students at UMK Campus City, while the independent variables include environmental barriers, perception of lack of healthy food options, and lack of physical activities.


Figure 1: Research Framework

METHODOLOGY

Research Design

The research methodology was covered in this chapter and used to complete our research. Research is an intellectual activity, and such as the term must be used in an industrial sense. In this chapter, we look at the main parts of research methodology, which are the research method, method of data collection, and sampling plan. The research methodology includes carrying out this study, target population, sample size, sampling method, data collection and instrument. This chapter concludes with a summary of this chapter. The research design is the overall approach for conducting research. Quantitative research gathers and analyzes non-numerical data such as text, video, and audio. It may be used to find patterns and averages, predict outcomes, test causal relationships, and generalize results.

287

Data Collection

In the first stage, this study involved primary data collection using questionnaires using Google Forms, which were distributed to 406 respondents who participated in this study. The link to the Google form was distributed to all year 3 students at University Malaysia Kelantan City Campus via social media such as Facebook, WhatsApp, Telegram, and E-mail. It is very convenient to minimize cost, saves time and is significantly applicable during this global pandemic outbreak.

Sampling

The convenience sampling approach was utilized in this study as a non-probability sampling strategy. Questionnaires were produced and disseminated online or uploaded on social media pages to collect information from respondents. The researcher will employ the probability sampling approach, which is simple random sampling.

The sampling approach employed in this study was the probability sampling methodology, specifically simple random sampling, which is a basic probability sampling strategy. The researchers used Krejcie and Morgan's (1970) equation to estimate the sample size for this study in order to achieve a reliable and valid sample. This equation's formula is as follows: $S = x^2Np(1-p)$ $e\,2(N-1) + X2p(1-p)$ n = number of samples N stands for population size. e = degree of precision represented as a proportion (0.05) x 2 = chi-square of degree of freedom 1 and 95 percent confidence (3.841) p = population percentage (if unknown, 0.5)

$$S = x^2Np(1-p)$$
$$e\,2(N-1) + X2p(1-p)$$

n = sample size
N = population size
e = the degree of accuracy expressed as a proportion (0.05)
x^2 = chi-square of degree of freedom 1 and confidence 95% (3.841)
 p = proportion of population (if unknown, 0.5)

Data Analysis

This study employed three types of data analyses: frequency analysis, descriptive analysis, and reliability analysis. The data were analyzed with SPSS to illustrate the links between the dependent variable and the independent variables as a series of statistical processes represented by regression analysis.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the result of frequency analysis of this research.

Table 1: Frequency Analysis

Respondent Profile	Classification	Frequency	Percentage (%)
Gender	Male	105	37.8
	Female	173	62.2
Range of Age	18-20	14	5.0
	21-23	221	79.5
	24-26	42	15.1
	27 and above	1	0.4

Race	Malay	139	50.0
	Indian	68	24.5
	Chinese	60	21.6
	Others	11	4.0
Marital Status	Single	271	97.5
	Married	7	2.5

Table 1 shows the characteristics of respondents. 105 out of 278 respondents are male, 37.8%, while 173 are female representing 62.2%. The highest percentage is from 21 to 23 years old, representing 79.5%. Meanwhile, age 24 to 26 years old represented 15.1%. From 18 to 20 years old are 5.0% and for 27 years and above just 0.4%. From table 1, the highest percentage of races is Malay which represented 50.0%, followed by Indian, which represented 24.5%. Chinese represented 21.6% of respondents, and others represented just 4.0%. The highest percentages of marital status are single, which represented 97.5%. Meanwhile, married people are represented with just 2.5%.

Result of Descriptive Analysis

Table 2 below shows the result of descriptive analysis for this research.

Table 2 Mean, standard deviation of items and variable (n=278)

Variables	Statement	Mean	Standard Deviation
Environment Barriers	I am eating in response to stress	4.77	1.651
	I always feel hungry at home	5.50	1.385
	I always have food on hand while doing assignment	5.20	1.490
	I always try new viral recipes with my family during MCO	4.35	1.657
	I always order food from food apps like Grab food and Food Panda	4.35	1.621
Lack of Healthy Food	The taste is not good	3.69	2.195
	Do not have consciousness to consume healthy food	3.17	2.008
	Fast food is tastier than healthy food	4.00	2.176
	Families do not practice healthy eating at home	3.07	2.000
	Lack of knowledge about healthy food	3.09	2.039
Lack of Physical Activities	Due to MCO, outdoors activities are restricted	5.99	1.422
	Do not have enough time due to a lot of work	5.84	1.414
	Lack of awareness of the health of body	3.41	2.093
	Spend much time on media social	5.30	1.433
	Spend much time in the kitchen	4.33	1.699

Weight Gain Among Year 3 Student in University Malaysia Kelantan City Campus	I felt MCO affect my weight gain	5.08	1.575
	I felt my eating schedule is out of control	4.59	1.660
	I felt environment affect my weight	5.04	1.547
	I felt lack of physical activities affect my weight	5.08	1.496
	I felt lack of healthy food affect my weight gain	4.56	1.885

Environmental Barrier scores showed (mean=4.8345, SD=0.91499), this means that environmental barriers are a factor in weight gain among students since respondents agreed on most of the items. Respondents agreed that eating in response to stress, (mean=4.77, SD=1.651). Respondents agreed that they always feel hungry at home, (mean=5.50, SD=1.385). Respondents always have food on hand while doing assignments, (mean=5.20, SD=1.490) and always try new viral recipes with family at home, (mean=4.35, SD=1.657). Respondents agreed to order food from food apps, (mean=4.35, SD=1.621). Students consume fewer fruits and vegetables daily and report high consumption of high-fat, high-calorie items (Racette, 2005).

Lack of Healthy Food" scored the lowest among other variables, which is (mean=3.4036, SD=1.82778). Respondents agreed that the taste is not good (mean=3.69, SD=2.195). Respondents agreed they do not have consciousness to consume healthy food, (mean=3.17, SD=2.008). Respondents agreed that fast food is tastier than healthy food, (mean=4.00, SD=2.176) and agreed that families do not practice healthy eating at home, (mean=3.07, SD=2.000). Lack of knowledge about healthy food represented (mean=3.09, SD=2.039). The proliferation of shopping malls, convenience stores, vending machines, and fast-food restaurants has created a dangerous environment for young adults to engage in bad eating habits (Gunasegaram, 2012).

Lack of Physical Activities" scored the highest among other variables shown (mean=4.9734, SD=0.87551). Respondents strongly agreed that due to MCO outdoor activities are restricted, (mean=5.99, SD=1.422) and agreed that they do not have time due to a lot of work, (mean=5.84, SD=1.414). Respondents agreed that there is a lack of awareness of the health of the body (mean=3.41, SD=2.093). Respondents agreed to spend much time on social media, (mean=5.30, SD=1.433) and agreed to spend much time in the kitchen, (mean=4.33, SD=1.699).

The dependent variable score showed, (mean=4.8683, SD=1.27665). Literally respondents agreed with the statement that MCO affects weight gain with (mean=5.08, SD= 1.575). Respondents agreed that statement eating schedule is out of control, (mean=4.59, SD=1.660). Respondents agreed that the environment affects weight (mean=5.04, SD=1.547) and agreed lack of physical activities affected weight (mean=5.08, SD=1.496). Respondents agreed that lack of healthy food affects weight (mean=4.56, SD=1.885).

Relationship between environmental barriers, lack of healthy food and lack of physical activities on weight gain among year 3 students in University Malaysia Kelantan City Campus.

Table 3: Pearson's Correlation Relationship

Variable		Weight Gain
Environmental Barriers	Pearson correlation	.546
	Sig. (2-tailed)	.000
	N	278
Lack of Healthy Food	Pearson correlation	.687
	Sig. (2-tailed)	.000
	N	278
Lack of Physical Activities	Pearson correlation	.592
	Sig. (2-tailed)	.000
	N	278

The results in table 3 indicated that environmental barriers and weight gain among students are 0.546, which indicates positive linear relationships between environmental barriers and weight gain among year 3 students at UMK City Campus. The lack pf healthy food and weight gain among students. 687 which indicates positive linear relationship. Meanwhile, lack of physical activities and weight gain among students-._592, which indicated a positive linear relationship. All three variables are correlated, and the relationship is significant (P<0.05).

H1: There is a relationship between environmental barriers and weight gain among year 3 students at UMK City Campus.

H2: There is a relationship between lack of healthy food intake and weight gain among year 3 students at UMK City Campus.

H3: There is a relationship between lack of physical activities and weight gain among year 3 students at UMK City Campus.

DISCUSSION AND RECOMMENDATIONS

Based on this research, the researchers examined the factors affecting weight gain among year 3 students at the UMK City Campus. This study breaks a new avenue by highlighting the proposal's recommendations that improve future studies. This proposal could provide double advantages for new research to refine a study's factors that influencing weight gain among university students.

First, if they have adequate time and money, future researchers may be able to collect data on different campuses based on the differences in the courses registered. This is because future research will be able to collect data from all campuses and use the resources available at universities to acquire information and analyze it efficiently. When there are environmental barriers among students, the data collected will be more precise in determining the level of weight growth because the obstacles they face are different, depending on where they are.

Next, the journal can also be reproduced by future researchers. This study compared the outcomes from the Western country using a well-known journal. As a result, cultural gaps between western and eastern students may exist. Furthermore, different countries' populations have different perspectives, which might lead to bias. Future researchers should look for publications in public libraries, as well as on Google Scholar and My Athens, to find more information from overseas on weight gain among university students, to help improve reading resources.

Future research may use other independent factors to modify the weight growth component among university students. Furthermore, insufficient sleep can be an independent determinant that contributes to weight gain, even if students believe they have gotten enough rest to continue

trying to complete activities. Furthermore, future researchers may want to take into account family history and genes as independent variables that influence weight gain in respondents.

Last but not least, the researchers might switch from quantitative to qualitative data collection approaches. Future researchers can collect data through questionnaires and qualitative methods such as telephone surveys and face-to-face interviews. Specifically, the questions asked for face-to-face or telephone interviews can reveal the respondents' behaviors clearly. As a result, it gives more accurate, consistent, and efficient data for studies on whether a lack of healthy food intake might influence weight increase.

CONCLUSION

In conclusion, this study has been accomplished to discover factors influencing weight gain among year 3 University Malaysia Kelantan students at city campus. A total of 278 respondents from the age of 18 until 27 years old and above were selected. Four independent variables: eating behavior, lack of physical activities, environmental barriers have been chosen as an influence on weight gain among them with the dependent variable. Overall, based on Pearson's correlation analysis, Eating Behavior (0.687), Lack of Physical Activities (0.592), Environmental Barriers (0.546).

ABSTRACT

Muslim Friendly gyms and health centers are those that provide products and services in compliance with Shariah principles. Following the increased demand for exercise among Muslims, new training approaches and methods to achieve the aims of weight loss, muscle growth, heart health, or sports and leisure performance at the same time are currently emerging. Furthermore, both Muslims and non-Muslims are increasingly interested in halal products and services. The goal of this research is to determine the relationship between consumer's behavior and the community's desire to protect the Muslim Friendly gym in Kota Bharu, Kelantan. Attitudes, subjective norms, and perceived behavioural control were employed as independent variables in this study, the purpose of protecting the Muslim Friendly Gym, as the dependent variable. This research also looks into the intention to assist Muslim-friendly gyms. Google Forms was used to disseminate a series of questions to a total of 387 target residents. SPSS was used to analyse the data from the questionnaires. The findings of the study showed there is a significant influence of attitudes, subjective norms, and perceptions behavioural control on the community's intention to support Muslim-friendly gyms in Kota Bharu Kelantan. Among the most influential are the subjective norm and perceived behavioural control. In conclusion, this study can be a reference to anyone wishing to refer for future studies.

Keywords: Gym and Health, Muslim Friendly Gym, Attitudes, Subjective Norms, Perceived Behaviour Control.

INTRODUCTION

A gym is a commercial business or usage where physical exercise or training is performed on an individual basis, employing exercise equipment or open floor space, with or without one-on-one instruction from a personal trainer. A gymnasium, often known as a gym, is a covered athletic facility. They are widely seen in sports and fitness centers, as well as in educational institutions as activity and learning areas. "Gym" is also slang for "fitness center," which is frequently an indoor recreation facility. A gym is a facility where individuals may work out using a variety of equipment and machinery. Muslim-friendly gyms are rising as a result of the growing need among Muslims to exercise, live a healthy lifestyle, rejuvenate, and have fun while covering the Awrah. This chapter discusses the study's history, problem statement, research questions, research objectives, the significance of the study, and term definitions.

Everyone dreams of a healthy life. Health is a necessary foundation for people. Regular physical exercise is the key to achieving a goal. Exercise has been defined as a reasonable way to contribute to and maintain good health status (O'Brien, 2005; & Dansul, 2006). In research, O'Brien and colleagues (2005) found that sports and exercise psychologists. try to explore the reasons that contribute to people's motivation to exercise on stage, which can improve physical health. Biddle, Fox, and Boutcher (2000) mentioned that exercise can acquire and balance human emotions such as joy, mood, and posture. Exercise also helps reduce depression. Similarly, Fox (1999) explains that exercise is not the only one that can prevent some diseases

but also enhance a positive mental mind towards goodness and to achieve better lives. In short, exercise is an essential key to human health for driving energy from body movements and physical activity.

All gyms usually focus on weight training and physical strength-only body training. Equipment in the gym is usually a set of free weights, dumbbells, heavy equipment, and heavy machinery as cardiovascular equipment. They are designed specifically to exercise, develop, and build strength ending body muscles. One of the gyms provides group classes but the focus is on weight training for clients interested in building muscle, weightlifting, and physical strength body training. Most gyms also have personal trainers and have memberships such as fitness. Gyms ususally attracts more male members when compared to other types fitness center. Bacille Calmette-Guerin (BCG) attempts to provide therapies that are evidence-based, particularly those relating to the impact of exercise on physical and psychological health.

Research Objectives

Therefore, this study aims to achieve three primary objective as follows:

1. To examine whether or not attitude does have a significant influence on community's intention to support Muslim-friendly gyms in Kota Bharu Kelantan.
2. To examine whether or not subjective norms does have a significant influence on community's intention to support Muslim-friendly gyms in Kota Bharu Kelantan.
3. To examine the whether or not perceived behavioural control does have a significant influence on community's intention to support Muslim-friendly gyms in Kota Bharu Kelantan.

Research Question

Alongside the objectives, this study intends to answer the following questions:-

1. Is there any significant influence of attitude on community intention to support Muslim-friendly gyms in Kota Bharu Kelantan?
2. Is there any significant influence of subjective norms on community intention to support Muslim-friendly gyms in Kota Bharu Kelantan?
3. Is there any significant influence of perceived behavioural control on community intention to support Muslim-friendly gyms in Kota Bharu Kelantan?

Significance of the study

Definition of Term

Muslim friendly gym

Gyms that provide professional gym services by Islamic Law or Shariah in terms of management, services, and products. It will be linked that the treatments provided to clients and the products used are appropriate for Muslim clients. Sports-related modifications allow Muslims to participate in sports in a way that is unique to Muslims while not affecting other participants. Among these changes is the ability to change in private, as well as the wearing of special garments while participating in sports with non-Muslims. Often, modifications involve negotiations with non-Muslims. Some of these have resulted in agreements, while others have resulted in political and legal disputes. Muslim friendly gym will have separate rooms and services for women and men.

LITERATURE REVIEW

Malaysia's Gym Market

The Malaysian Fitness Alliance, a loose coalition of private gym owners and operators from around Malaysia, encourages the government to reclassify the gym and fitness business as an important service and prioritise the sector's reopening as soon as possible. As the country grapples with the pandemic's ramifications, much has been said and written about the enormous financial load on companies and employees alike, as well as government spending.

The severe procedures intended to limit the Covid-19 outbreak have influenced the expansion of these boutique gyms and yoga studios. Because the gyms and studios were closed for nearly three months due to the Movement Control Order (MCO), their proprietors had to adapt rapidly to survive (Tan Zhai Yun 2020).

Muslim-friendly gym Concept

Recently, there has been a surge of interest in the Muslim-friendly gym concept, also known as the Muslimah Gym, in the Malaysia gym industry. This concept is well known to the public in terms of the development of the Malaysian Gym industry because many spas use it. It is one of the spas that provide professional gym services by Islamic or Shariah Law in terms of services, management, and products (Halim & Mohd Hatta, 2017). This type of gym must not only provide halal products and segregated services between men and women but the entire operation must be managed by Shariah principles and values. The tangible and intangible elements of a Muslim-friendly gym must act by the Shariah principle.

Some types of large box gyms offer one-on-one training, where you will meet with sales team participants who may provide training session packages and will begin to reduce the cost of buying more sessions during the initial visit. Most of the time, the first individual you meet is not qualified to talk about training with a client. This is an attempt to make a commission by using sales techniques and convincing visitors to buy training modules that they do not intend to get in the first place. Participants will meet with coaches who are not required by the institution to qualify, and if they are truly qualified, it is a boneless education-based certification. Most of these workers are paid a minimum wage or a little extra, and turnover is high. Participants who have trained at the gym have complained about coaches yelling at them, texting during sessions, not paying attention to their clients, arriving late, or not arriving at all. This is a bit of an explanation of the type of gym box.

Following that is a 24 -hour access gym (franchise/gym chain), which is technically a 24 - hour access gym. Gyms that are open 24 hours a day or accept "key cards", such as Anytime Fitness or Snap Fitness. These gyms differ depending on the franchise goals of each owner. They differ in size and equipment, but one thing they all have in common is that customers can use the key card at any time of the day or night. The majority of them have all the cardio equipment. Customers sign up for coaching subscriptions and are assigned to large groups with less tailored coaching where everyone does the same activities. The difference is that most boot camps use exercises that are easy to master and can be retracted quickly.

Theory of Planned Behaviour

According to LaMorte, (2019), the Theory of Planned Behaviour (TPB) started as the Theory of Reasoned Action in 1980 to anticipate an individual's intention to perform a behaviour at a particular time and place. TPB has the power to predict one's behavioural intentions. The model from this theory can be influenced by external factors to make the theory suitable and developed (Ahmad, & Zainol, 2014). The TPB has shown many uses in public health than the Health

Belief Model, but it remains more to consider environmental and economic influence (LaMorte, 2019). This theory aims to explain all behaviours in which individuals can exercise self-control (LaMorte, 2019). It is also a model used to address individual motivational factors within unique contexts to explain the overall execution of a specific behaviour (Raygor, 2016).

Attitude

Refers to a person's overall evaluation of behaviour as positive or negative based on belief in the behaviour and the effect of that behaviour on whether it is good or bad (Jing, 2008). Attitude is an assessment of specific behaviours that involve objects of attitude, such as buying a product, product selection, and acceptance of a product or service (Blackwell et al., 2006). The tendency to respond well or badly to certain behaviour (Fishbein & Ajzen, 1974). In Green Hotel cases, customers can stay in green hotels because they have healthy eco-friendly guest rooms (or amenities), clean food, healthy food, and are more socially responsible (Laura Fredericks, 2020). When deciding on a particular behaviour, a person will likely evaluate the benefits and costs that may come from such behaviour (Lam, & Hsu, 2006).

Subjective Norm

According to LaMorte, (2019), subjective norms refer to the belief that many individuals agree or disagree with that behavior. Besides, it is someone who has a normative belief in what is important to be thought of by others must be done, and the extent to which one is motivated to adhere to what one thinks (Huh, & Knutson, 2010). It is also related to someone's belief that their peers and those who are important to them should be involved in the behavior (LaMorte, 2019). It is also described as social factors, which relate to a person's impression of social pressure from persons they deem significant in their lives, and whether or not they do anything about it (Fishbein, 2000). This means that the subjective norms of an individual depend on his or her perception of the thoughts of significant others (e.g. family members, friends, colleagues, and the immediate supervisor) on their performed behavior (Brouwer et al., 2009; Vermeulen et al., 2011). In gym intention cases, reference groups are influential when one considers the journey of pleasure to the wine region. Gym visitors get a lot of gym information through word of mouth and from reference groups.

Perceived Behavioural Control

Refers to a person's perception of convenience or difficulty in the behavior of interest (LaMorte, 2019). These differ between situations and actions, which results in individuals having different perceptions of the situation-dependent behavior (LaMorte, 2019). Then, perceived behavioural control is the perception that e difficult or easy for someone to do something (Ajzen, 1991). In hospitality and tourism cases, identify some barriers to participating in leisure activities due to problems of time, money, or family life cycle (Crawford et al., 1991).

Research Hypothesis

H1   Attitude does have a significant influence on community's intention to support Muslim-friendly gyms in Kota Bharu Kelantan.

H2   Subjective norms does have a significant influence on community's intention to support Muslim-friendly gyms in Kota Bharu Kelantan.

H3   Perceived behavioural control does have a significant influence on community's intention to support Muslim-friendly gyms in Kota Bharu Kelantan.

Research Framework

Figure 1 below shows the research framework used for this study

Figure 1: Research Framework

METHODOLOGY

Research Design

Quantitative research is a method that focuses on objectivity, internal validity, and examination of hypotheses in the context of the social sciences. There is four quantitative research design which is descriptive research, correlational research, causal-comparative or quasi-experimental research, and experimental research. Usually, the quantitative method is used to study the beliefs, favourites, health, and other behaviours of the individual to be observed. It is also useful for obtaining information on the views, personalities, behaviours, or attitudes of the general public from a large group. Therefore, this research used a quantitative research method to study the relationship between consumer behaviour and community intention to support a Muslim-friendly gym in Kota Bahru, Kelantan. Thus, the quantitative research approach, using a cross-sectional study design used to measure the intention to support Muslim-friendly gyms and independent variables namely attitude, the subjective norm as well as perceived behavioural control.

Target Population

A survey's target population is the entire set of units for which survey data will be used to make inferences. As a result, the target population defines the units to which the survey's findings are intended to generalize. The first step in designing a survey is to establish the objectives of the study. The second step should be to define the target population. The definition of target populations is important because it determines whether sampled cases are eligible or ineligible for the survey. The target population's geographic and temporal features, as well as the types of units included, must be determined. (Raul Sanchez- Reillo's (2011). The study's target participant is a community in Kota Bahru, Kelantan, Malaysia.

Sample Size

The sample size is an important aspect of any empirical study in which the goal is to conclude a population from a sample. A random sample must be of sufficient size to generalize from it and avoid sampling errors or biases. This research provides an overview on how to calculate survey sample size in social research and information system research. The Kota Bharu District is Malaysian in northern Kelantan. It includes the state capital, Kota Bharu, as well as the towns of Pengkalan Chepa and Ketereh. The study enlisted the participation of 200 Kota Bharu residents.

Sampling Method

This study uses non. probability sampling of multiple convenience sampling strategies aimed toward choosing states and districts in addition to sampling centers the of 387 respondents. Purposeful sampling is a non-chance pattern decided primarily based on populace traits and examination objectives. Each person changed randomly decided and every person could be decided on for the pattern as every other subset of individuals. Kelantan Was changed to selected due to the fact it's far referred to as the " serambi Mekah " ("veranda for Mecca"). The population of the Kota Bharu city includes 93% Muslims with the others being Buddhists, Hindus, and Christians so this shows that the goal client is almost all organisations in Kota Bharu. If there are numerous Muslim -pleasant gyms in Kelantan, then Muslims there will locate it less difficult to get the carrier without deliberating any troubles to be opposite to Syariah.

Data Collection Procedure

Surveys of aspects that impact the consumer community intended to support Muslim-friendly Gyms in Kota Bharu to create number one statistics are used for data collecting. Primary statistics entails accumulating records, especially for the look inside the shape of real reassess including a set of questionnaires. This survey hired a self-administered statistics series mode, wherein it required the respective respondents to reply to the questionnaire themselves, in the absence of the researcher. This study was conducted in Kota Bahru, that's in the middle of Kota Bharu, and in different places. The questionnaire may be distributed to the unique respondent. The explanation may be given to the respondents once they agree to respond to the questionnaires. There will be no forcing to reply to the questionnaire. The questionnaires may be amassed again as soon as respondents answered.

Research Instruments

The questionnaire was designed to identify variables about attitudes, subjective norms, perceived behavioural control, and intention to support a Muslim -friendly gym. It is divided into 3 sections: Part A, Part B, and Part C (Appendix 2: Questionnaire). In Section A, respondents should indicate their answers to general demographic information. Section B is the general knowledge of individuals based on attitude, subjective norms, and perceived behaviour control to support Muslim-friendly Gym. While Section C is the desire to get service at a Muslim-friendly Gym. Section A uses closed-ended questions. The closed-ended question refers to any questions that the researcher provides to the respondent. The respondent only needs to answer one answer related to himself. Section B and Section C use the Likert Scale. A Likert Scale is an indication of the extent to which disagreement and agreement are determined. Each question was scored numerically with a range of 1 to 5. 1 indicates strongly disagrees, 2 disagrees, 3 is neutral, 4 indicates agrees, and lastly is 5 which is strongly agreed.

Data Analysis

Data analysis is performed on data collected from respondents before transforming the data into usable information. The fundamental analysis gave useful information and leads the rest of the data analysis and result interpretation. The data collected from the questionnaire will be analysed using the computer software packages IBM Statistical Package for Social Science (SPSS) version 25. SPSS is a window-based tool that may be used to create graphs and tables for data entry and analysis. The obtained data will be simply run and can handle information quickly using a variety of techniques. Data analysis tools make it simpler for users to handle and modify data, analysed linkages and correlations across data sets, as well as uncover patterns and trends for interpretation.

Analysis Descriptive

Descriptive analysis is the act of understanding, rearranging, sorting, and altering data from descriptive information by changing raw data into a form or tabular format that is easily understandable. The descriptive analysis would often summarise and show the data after measuring the central tendency and dispersion or variability of the data. A set of questionnaires was circulated by the researcher to get the desired data. The descriptive analysis can aid in the refinement of a vast quantity of data clearly and recognizably.

Pearson Correlation Analysis

The collected data will be analyzed using Pearson Correlation Coefficient analysis in this study. Researchers can use Pearson Correlation Coefficient Analysis to determine the strength of the linear relationship between the independent variable (IV) and the dependent variable (D) (DV). This study identifies the characteristics that impact consumer's intentions to support Muslim-friendly gyms (IV) among locals of Kota Bharu, Kelantan.

FINDING

Results of Frequency Analysis

Table 1 below shows the result of frequency analysis of this research.

Table 1: Frequency Analysis Results

Characteristics	Frequency	Percentage
Age		
18-22 year old	114	26.5
22-25 year old	243	56.5
25 and above	330	7.0
Marital status		
Single	314	73.0
Married	50	11.6
Divorced	23	5.3
Level of Education		

SPM	56	13.0
DIPLOMA	54	12.6
DEGREE	254	59.1
MASTER	23	5.3
Race		
Malay	311	72.3
Indian	42	9.8
Chinese	28	6.5
Christian	1	0.2
Other	5	1.2
Income		
RM500-RM1000	152	35.3
RM1001-RM3000	144	33.5
RM3001-RM5000	32	7.4
Other	59	13.7

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research.

Table 2: Descriptive Analysis Results

Variable	Items	Mean Score	Standard deviation
Perceived Behavioural Control	I will always be able to find a Muslim-friendly gym	3.92	0.935
	There are many choices of Muslim-friendly Gym close to my house	3.48	1.141
	Prices at Muslim-friendly Gym are affordable and reasonable	4.43	0.806
	Most people like to go to Muslim-friendly Gym at least once per month	3.98	0.868
	I am confident to repeat go to Muslim-friendly Gym	4.25	0.718
	I think Muslim-friendly gym can meet the customer's expectation standards well	4.11	0.842
Attitude	I prefer a gym that used halal products and services in their gym	4.52	0.717

	I'm sure to consume halal products and services rather than non-halal products at Muslim-friendly gym	4.54	0.671
	I'm sure Muslim-friendly gym used clean and safe products and equipment	4.53	0.683
	Go to Muslim-friendly gym will feel safe	4.54	0.667
	I'm sure that Muslim-friendly gym can protect the privacy of individuals	4.52	0.669
	I think that Halal products and services in Muslim-friendly gyms are better than in the ordinary gym	4.48	0.695
	I think that Muslim-friendly gym is not as secure as a normal gym	2.78	1.540
Subjective Norms	I'm sure the closest (family & friends) will choose treatments at Muslim Friendly gym	4.55	0.660
	People can influence me to visit Muslim-friendly gym	4.53	0.662
	The closest people (family & friends) prefer Muslim-friendly gyms because they used halal products and services	4.54	0.662
	I think Muslim-friendly Gym is better than other gyms	4.43	0.754
	My family will emphasize to me the benefits of going to Muslim-friendly gym	4.52	0.718
	I think Muslim-friendly gym is more comfortable than other gyms	3.79	0.670
	I'm sure that my family and friend will go to Muslim Gym regularly	4.27	0.818
Community Intention	When I would like to use the gym I always choose a package that is worth it	4.40	0.654
	I will come to Muslim-friendly gym again in future	4.56	0.662
	I'm willing to pay more for treatment and exercise at Muslim-friendly gym	4.27	0.720
	I prefer it if Muslim-friendly gym available in my area	4.31	0.776
	If I want any gym treatment and service Muslims will go to Muslim-friendly gym because it is convenient to reach	4.32	0.786

Table 2 shows the standard deviation for the independent variables specifically attitudes, Subjective norms, perceived behavioural control, and community intention. The dependent variable is community intention to support Muslim-friendly gyms among people in Kota Bharu Kelantan. In Perceived Behavioural Control the highest standard deviation value is 1.141 Next, are subjective norms which are 0.818, then attitudes 1.540, and lastly, community intention which is 0.786.

Result of Reliability Analysis

Table 3 below Shows the result of reliability of analysis of this research.

Table 3: Results of Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Perceived Behavioural Control	5	0.809
Attitude	7	0.603
Subjective Norms	6	0.834
Community Intention	5	0.734

The reliability test results for all variables are summarised in Table 3. Cronbach's Alpha, a behavioural perception reliability test, yielded a result of 0.809 points. Cronbach's alpha received a value of 0.603 in a reliability test for attitude. The Cronbach's Alpha subjective norm condition's reliability test resulted in a score of 0.834. Cronbach's Alpha calculated a value of 0.734 for the community intention reliability test.

Result of Pearson Correlation Analysis

Table 4 Below Shows the results of correlation analysis of this research.

Table 4: Pearson Correlation Analysis Results

Hypothesis	P-value	Result (support/not supported)
H1: There is a significant influence of attitude on community intention to support Muslim-friendly gyms in Kota Bharu Kelantan.	0.606	H1 is supported
H2: There is a significant influence of subjective norms on community intention to support Muslim-friendly gyms in Kota Bharu Kelantan.	0.503	H2 is supported
H3: There is a significant influence on perceived behavioural control on community intention to support Muslim-friendly gyms in Kota Bharu Kelantan.	0.712	H3 is supported

Based on the results shown in Table 4, the significant value for attitude is below 0.05, and when p is less than 0.05, we can reject the null hypothesis and accept the alternative hypothesis. This proves that there is a significant relationship between the attitudes and intentions of the community among the residents of Kota Bharu, Kelantan. The Pearson correlation is 0.606.

Then, Table 4 shows the relationship between subjective norms and societal intentions. Based on the results, the significant value for the subjective norm is 0.001, and when p is less than 0.05, it means we reject the null hypothesis and accept the alternative hypothesis. This proves that there is a significant relationship between subjective norms and community intentions among the residents of Kota Bharu, Kelantan. The Pearson correlation is 0.503. Finally, the significant value for perceived behavioural control is 0.001, and when p is less than 0.05, it means we reject the null hypothesis and accept the alternative hypothesis. This proves that there is a significant relationship between the perception of behavioural control with community intentions among the residents of Kota Bharu, Kelantan. The Pearson correlation is 0.712. In sum, there is a positive overall correlation between attitude, subjective norm, and perceived behavioural control.

DISCUSSION AND RECOMMENDATION

The aim of the research study, according to the discussion, is to find out the relationships between factors that influence consumer community intention to support Muslim-friendly gyms in Kota Bharu, Kelantan. The research's main results demonstrated that there was a significant alliance between the two groups as a consequence of the investigation of factors that influence consumer community's intention to support Muslim-friendly gyms in Kota Bharu, Kelantan. Additionally, previous research has shown a substantial relationship between attitudes, subjective norms and perceived behavioural control, and community intention.

Furthermore, according to the study's Pearson Coefficient values, there is a moderate positive correlation for attitude, while high positive correlation is found between perceived behavioural control. Subjective norms has the highest positive correlation as compared to the other factors. The correlation results of the research attitudes, subjective norms and perceived behavioural control, and community intention are (0.606>0.503>0.712) respectively.

The first recommendation to be suggested by the study is to carry out the same study using the qualitative method. This is because some of the respondents did not have enough knowledge to answer the survey. Some of them prefer to choose an interview session. Plus, some respondents did not know how to read the questionnaire. The second recommendation is for researchers to apply the survey respondents' letters from the Majlis Perbandaran Kota Bharu Kelantan (MPKB) when carrying out the survey. This can avoid misunderstandings between both parties. The letter will explain the survey towards the intention community to support Muslim-friendly gyms. This also can build the trustworthiness of researchers and the survey session will go smoothly. The last recommendation is to enlarge the target population of the intentional community to support Muslim-friendly gyms. The researchers can enlarge it from the target population of the Kota Bharu area to all over Kelantan. This will make it easier to collect data and increase the number of sample data.

CONCLUSION

In conclusion, this study has been accomplished to discover the acceptance of intentional community in Kota Bharu, Kelantan to support Muslim-friendly gyms. Three independent variables (attitude, subjective norms, and perceived behavioural control) were chosen to be examined in term of their relationship with the dependent variable, which is the specifically of intentional community in Kota Bharu, Kelantan to support Muslim-friendly gyms. A total 387 respondents from the age of age 18 years old and above in Kelantan were involved to investigate the acceptance of intentional community in Kota Bharu, Kelantan to support Muslim-friendly gyms. The overall Pearson's based correlation analysis of attitude is (0.606).

The Pearson's correlation of subjective norms is (0.503). The Pearson's correlation of perceived behavioural control is (0.712).

ABSTRACT

The practice of a balanced diet like healthy foods intake that contain nutrients such as fats, carbohydrates, proteins and vitamins is important for the body. There are many effects for not taking good care of daily nutrition. Hence, understanding the factors that affecting healthy food choices among students is critical. Therefore, the study aims to investigate the factors that affecting healthy food choices among students taking wellness degree program at Universiti Malaysia Kelantan, City Campus. The study has been conducted using a quantitative research approach which implements online survey to collect the data. A total of 118 respondents have participated in this study which has been conducted through social media such as WhatsApp group and it focuses on the third-years wellness students of Universiti Malaysia Kelantan (UMK), City Campus. Based on the data analysis, the mean value of dependent variable and independent variable are healthy food choices (32.69), psychological factors (34.75), financial factors (27.02), and physical activity factors (33.52). Based on the research findings, all of research objectives have been achieved. The hypothesis of each variable like psychological factors, financial factors, and physical activity factors has shown significant positive relationships with healthy food choices among wellness students at Universiti Malaysia Kelantan, City Campus. A few recommendations related to the study have been proposed by the researchers.

Keywords: Balanced Diet, Healthy Food Choices, Psychological, Financial, & Physical Activity.

INTRODUCTION

Food choice refers to the way people choose what to buy and eat (Eufic, 2021). According to Denise et al. (2014), nowadays, food choices are the most common among university students in Malaysia. Health habits, both good and bad, acquired by students in their university years often translate into habits in their future lives. When people are unable or unwilling to exercise self-control, they frequently make impulsive food choices. Individuals with low self-control have a hard time resisting palatable but unhealthy food options. (Denise et al., 2014). The foods chosen during university years may have an impact on one's current and future health, such as obesity. Obesity in late adolescence is linked to a higher risk of cardiovascular disease, hypertension, and diabetes. (Horacek et al., 2012).

According to Sogari et al. (2018), in Malaysia, unhealthy eating habits have become more prevalent among university students. Higher intakes of energy-dense meals may increase health concerns, such as weight gain, among university students. Therefore, everyone, especially young people, should have access to healthy meals including fruits, vegetables, and nuts, especially at the university level. By encouraging certain menu adjustments, institutions should be able to persuade young people or students to choose higher quality food products. (Sogari et al., 2018). Besides, all university students need to have knowledge of healthy food choices. For example, recently, lack of knowledge about food choices with lower tendency has been seen in 400 private university students in Shah Alam, Malaysia. There are significant

differences in proportions, with the majority of students which is 277 having limited knowledge of food selection (69.3%) and the 123 students are well-versed in food choices (30.8%) (Yogesraj S. et al., 2019).

Healthy food choices are important in people's day by day activities. Unfortunately, food choices also can affect people if they choose wrong foods. Private university students report significantly worse knowledge of food choices, including take unhealthy food than the general population. However, there are also students who have knowledge of healthy food choices. Students tend to choose food without taking into account the disadvantages, including getting various diseases such as obesity, diabetes, cancer, cardiovascular diseases, and also osteoporosis (Yogesraj S. et al., 2019). Food, as we all know, has two characteristics like positive (it nourishes the body and heals sickness) and negative (it causes disease) which is the primary killers of people, according to reports from the World Health Organization (WHO). Therefore, the main focus of this study is to find out the factors that affecting healthy food choices among wellness students at Universiti Malaysia Kelantan (UMK), City Campus.

There are three objectives of this research:
1. To examine the relationship between psychological factor and healthy food choices among UMK students.
2. To investigate the relationship between financial factor and healthy food choices among UMK students.
3. To investigate the relationship between physical activity on healthy food choices among UMK students.

Significance of the Study

Traders

From the study, it will help to further understand the healthy food choices among people who open the foods business like traders. It is hoped that traders who do business in the campus area will play a role in selling balanced and nutritious food especially for university students around the campus. Most students will buy food at stores near the campus. Therefore, traders play an important role in the selection of healthy food among students on campus, including the wellness students of UMK City Campus. Finally, the study can be used as a reference for traders who want to learning about healthy food so that no problems of unhealthy food choices will occur in the future.

University Students

The significance of the study conducted by this researcher is expected to help the students gain knowledge about healthy and correct their eating patterns and practices. In addition, the findings of this study will also answer the research questions conducted. Thus, the research can help students prevent chronic diseases caused by their food choices. Healthy food choices can prevent students from facing the risk of obesity or weight gain. Besides, the study can help students to focus more on learning and can strengthen memory. This is because excellent students practice healthy food choices. Their brains will be stronger and improve like a process known as "memory unification". Students will be able to memorize easier and can improve their problem-solving skills. Finally, the study is important to help university students in Malaysia to overcome food choices that can causing various diseases and interfere with academic performance to achieve the CGPA target at the university. Finally, the study can be used as a reference for students who will be students to start learning so that no problems of unhealthy food choices occur.

LITERATURE REVIEW

Psychological Factors

Firstly, there are numerous factors that affect the healthy food choice among the students, including psychological factors (Razali M.A et al., 2014). Psychological factors are one of the factors that affect students to make healthy food choices (Razali M.A et al., 2014). It is also considered an internal component that influences a person's ability to make healthy food choices. This is also reinforced by the model of food choices that will be affected by food, individuals, which are the students, and the social-economic environment, as mentioned in the same publication.

Food is included in the model following their appearance and the nutrients it contains. The psychological factor is based on an individual's experience with a particular food, which can lead to many types of food beliefs, and the social economic environment is based on the students' attitudes toward food taste and healthiness. In general, psychological factors such as emotion, mood, and attitudes toward healthy meals have a significant effect in students' ability to make appropriate food choices. A psychological factor is one of them, and it is defined as a person's behaviour, such as emotional, stress mood, and depression. (Razali M.A et al., 2014).

Financial Factors

According Abdullah et al. (2014), customer perception on price and their responses toward price is very sensitive because price awareness is the sensitivity of the consumers to what they perceive about the cost of a product or service. Price of the product plays an important role in making decision of buying because usually customers will choose product which the quality and price are suitable and balanced. The most important factors predicting food choices among adults are taste, cost, nutrition, and weight control, in that order. Many studies have shown that people develop these preferences and habits when they are young. Parents and preschools, on the other hand, control many food decisions for the very young.

Low income is associated with poor quality dietary intake compared to those with higher income. Lower income individuals consume fewer fruits and vegetables, more sugar-sweetened beverages and have lower overall diet quality. Numerous studies have revealed that students have poor eating habits. On a daily basis, students eat fewer fruits and vegetables and report a high intake of high-fat, high-calorie foods. Food purchases are essential to investigate because they disclose potential dietary intake mediators and have implications for intervention efforts aiming at improving dietary intake and quality.

Physical Activity Factors

Physical activities are performed by every society while practicing a healthy lifestyle. According to World Health Organization (2020), physical activity is defined as a variety of body movements that result from muscle contraction and increased energy consumption. In this case, physical activity is a very good exercise for our body as well as make healthy food choices and it can prevent any disease. Research has documented the health benefits of physical activity and use of parks and recreational facilities, but the relationships between these factors and healthcare costs remain unexplored at the population level (Yuhei et al., 2019).

According to World Health Organization (2020), physical activity and a sense of purpose in life showed indirect benefits on self-reported health and function. In general, physical activity factors such as weightlifting, climbing activities, and traveling up and down stairs have a significant effect in students' ability to make appropriate food choices. Physical activity refers to deliberate efforts to raise activity beyond that required to perform social roles, whereas

exercise refers to deliberate efforts to increase activity beyond what is required to perform social responsibilities.

Healthy Food Choices

Healthy food choices are defined as practices that maintain health. With the practice of healthy eating, student should be able to avoid any dangerous diseases. For example, diabetes, obesity, heart disease, high blood pressure, and others. This is because healthy eating practices can be carefully planned by using the food pyramid, which is also used in the preparation of healthy food. Healthy food choices are often communicated to the community through the importance of healthy food intake. This is to give awareness to the community to practice healthy living at all times. When compared to shoppers in the control condition, the narrowly specified prompt consistently resulted in a larger proportion of goods and expenditure on healthy food and fresh produce. (Rachel et al., 2018).

Research Hypothesis

The literature review highlighted that the independent variables like psychological factors, financial factors, and physical activity factors may affect healthy food choices among UMK students. Therefore, the study planned to examine the relationship between these variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1   There is a significant relationship between psychological factor and healthy food choices among UMK students.

H2   There is a significant relationship between financial factor and healthy food choices among UMK students.

H3   There is a significant relationship between physical activities and healthy food choices among UMK students.

Research Framework

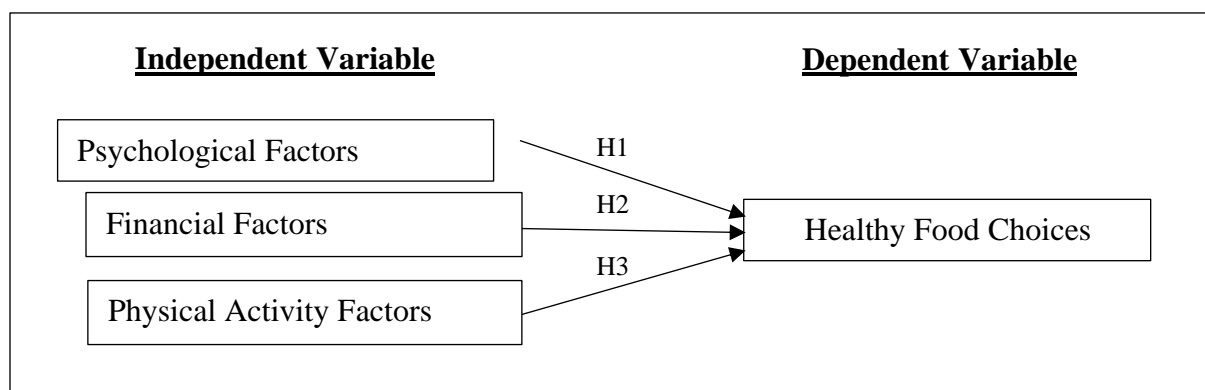
The Figure 1 below shows the research framework use for this study.


Figure 3: Research Framework

METHODOLOGY

Research Design

Research design is a framework that has been created to find the overall answers to the research questions conducted. the approach of this study is to use quantitative methods. A quantitative research approach has been used for the study of healthy food choices among third year wellness students. The quantitative approach means that it prioritises quantity. This is because

this research will involve numbers, numerical or statistical data. The quantitative approach is structured, has clear scheduling, and focuses on results.

Data Collection

Researchers collect primary data directly from primary sources such as survey like used a questionnaire through the Google form. A set of questionnaires is used to collect the information regarding that lead to the factors that affecting healthy food choices among UMK students. The questionnaire was distributed using an online platform to all third years students undertaking wellness program at Universiti Malaysia Kelantan, City Campus. The questionnaire was distributed through online and social media platform like WhatsApp. The students answered the questionnaire according to the condition related to their current situation as well.

Sampling

The researcher used the non-probability technique because samples are not selected at random. Purposive sampling will be use in this study because researcher knows the specific characteristic that exists in the population or respondents. Respondents consist of third years students. The number of respondents is around 118 students. The non-probability convenience sampling technique was chosen for collecting data for the report because this method saves time to find the necessary information. In addition, this sampling technique is easy to do and does not cost much for this research. The third years students from the wellness program were selected for this survey because they have more experience in healthy food choices. Respondents were selected to answer this questionnaire and all data were collected based on their answers.

Data Analysis

The researcher using Statistical Package for the Social Sciences (SPSS) version 28 to analysed the data obtained. There were four types of data analysis used in this study namely frequency analysis, descriptive analysis, reliability analysis, and correlation analysis. Frequency analysis was used to analyse demographic profile of respondents while descriptive analysis was used to describe the level of agreement of the variable. Reliability analysis was used to ensure the data from questionnaire was reliable and satisfied the purpose. The correlation analysis which is Pearson Correlation Test is a useful tool for determining any correlation and the strength of a linear relationship between an independent variable (IV) and a dependent variable (DV).

FINDINGS

Result of Frequency Analysis

Table 1 shows the result of frequency analysis of this research.

Table 1: Frequency Analysis

Characteristics	Frequency	Percentage (%)
Age		
18-21 years	12	10.2
22-25 years	106	89.8
Gender		
Male	17	14.4
Female	101	85.6
Marital Status		

Single	114	96.6
Married	4	3.4
Education Level		
Degree	118	100
Race		
Malay	108	91.5
Chinese	2	1.7
Indian	4	3.4
Iban	1	0.8
Bumiputera Sabah	2	1.7
Dusun	1	0.8
Religion		
Muslim	110	93.2
Buddha	2	1.7
Hindu	4	3.4
Kristian	2	1.7
How frequent you have to take healthy food in a week?		
0 day	3	2.5
1-2 days	33	28.0
3-4 days	53	44.9
5-6 days	14	11.9
7 days	15	12.7
What are the types of healthy food you take in a week?		
Fruits	41	34.7
Vegetables	37	31.4
Protein	29	24.6
Oats	11	9.3
Which place you prefer to take healthy food?		
House	100	84.7
University	9	7.6
Café	2	1.7
Restaurant	6	5.1
All	1	0.8

Table 1 shows the result of frequency analysis of respondents. The research focuses on third years wellness students at UMK and the majority of respondent are from age of 22-25 years old which are 106 respondents (89.8%), while the 18-21 years old are 12 respondents (10.2%). Most of respondents are female, 101 respondents (85.6%) while the male are 17 respondents (14.4%). Next, most of the respondents are single, 114 respondents (96.6%) while some of them are married, 4 respondents (3.4%). All the respondents have education level in Degree which are 118 respondents (100%). Majority the respondents are Malay which are 108 respondents (91.5%), followed by Indian which are 4 respondents (3.4%), Chinese which are 2 respondents (1.7%), Bumiputera Sabah which are 2 respondents (1.7%), Iban which is 1 respondent (0.8%), and Dusun which is 1 respondent (0.8%). Besides, the majority of respondents also are Muslim which are 110 respondents (93.2%), followed by Hindu, 4 respondents (3.4%), Buddhist which are 2 respondents (1.7%), and Kristian which are 2 respondents (1.7%). The majority of respondents choose 3-4 days of healthy foods intake in a week which are 53 respondents (44.9%), followed by 1-2 days which are 33 respondents (28.0%), 7 days which are 15 respondents (12.7%), 5-6 days which are 14 respondents (11.9%), and 0 day which are 3 respondents (2.5%). Next, majority of respondents, choose fruit as a healthy food taken which are 41 respondents (34.7%), followed by vegetables which are 37

respondents (31.4%), protein which are 29 respondents (24.6%), and oats which are 11 respondents (9.3%). Finally, majority of respondents choose house as place that prefer to take healthy food which are 100 respondents (84.7%), followed by university which are 9 respondents (7.6%), restaurant which are 6 respondents (5.1%), café which are 2 respondents (1.7%), and all which is 1 respondent (0.8%).

Result of Descriptive Analysis

Table 2 shows the result of descriptive analysis of this research.

Table 24: Descriptive Analysis Results

Variable	Items	Mean Score	Standard Deviation
Healthy Food Choices	You still choose to eat healthy food if you are on a budget.	4.24	0.792
	Healthy food more expensive than unhealthy food.	3.97	0.920
	You eat healthy food and still be overweight.	3.66	0.954
	Unhealthy foods are tastier than healthy foods.	4.05	0.846
	Having foods with a lot of sugar every day is not good for your health.	3.73	0.975
	Healthy food is hard to find.	4.14	0.830
	Healthy food choices can prevent dangerous diseases.	4.43	0.722
	Lack of nutrients can result in a student not being fit and easily tired.	4.47	0.759
Psychological Factors	Psychological factors such as emotional is factor that influence healthy food choices.	4.35	0.709
	Psychological factors such as stress is factor that influence healthy food choices.	4.09	0.887
	Psychological factors such as depression is factor that influence healthy food choices.	3.84	0.961
	You often feel emotional when you are in university.	3.74	0.956
	You often experience stress at university.	3.82	0.949
	You often eat unhealthy foods if you suffer from depression.	3.63	0.985
	You often feel stressed at university when faced with assignment submission deadlines.	4.14	0.933
	You regularly consume healthy foods to prevent any dangerous diseases even if you often feel stressed.	3.87	0.966
	You often skip meals when you have depression.	3.27	0.975
Financial Factors	Financial factors are among the causes of healthy food choices among wellness students.	4.04	0.891
	Healthy food is expensive for university student.	3.73	0.975
	Price of the product plays an important role in making decision to eat healthy food.	4.13	0.892
	Parents' finances influence healthy food choices for their children at university.	3.91	0.961
	Student from high-income family will choose expensive foods such as healthy foods compared to student from low-income family.	3.66	0.954
	Student from high-income family is more concerned about the quality of food even though the price is more expensive.	3.81	0.969

	Student from low-income family often choose cheap food without emphasizing its quality.	3.74	0.947
Physical Activity Factors	Physical activities such as climbing, walking, playing, weightlifting that effect healthy food choices among wellness students.	4.25	0.739
	Physical activity has a positive effect on the lives and health of wellness student.	4.31	0.700
	Physical activity such as weight lifting influence your healthy food choices.	4.16	0.827
	Is it important for every student to make healthy food choices for physical health care.	4.38	0.703
	Climbing activity is an excellent exercise for our body.	4.26	0.733
	Climbing activities can prevent any dangerous diseases.	3.90	0.831
	Physical activity helps you to choose healthy foods to stay energized.	4.28	0.761
	Friends at university often provide support for engaging in any physical activity and choosing healthy foods for doing it.	3.98	0.867

Table 2 shows the result of descriptive analysis of variable. For dependent variable which is healthy food choices, the item of Healthy Food Choices 8 (Lack of nutrients can result in a student not being fit and easily tired) has the greatest mean score (M=4.47, SD=0.759). The item of Healthy Food Choices 3 (You eat healthy food and still be overweight) has the smallest mean score (M=3.66, SD=0.954). Next, for the first independent variable which is psychological factors, the item of Psychological Factors 1 (Psychological factors such as emotional is factor that influence healthy food choices) has the greatest mean score (M=4.35, SD=0.709) while the item of Psychological Factors 9 (You often skip meals when you have depression) has the least mean score (M=3.27, SD=0.975). Besides, for the second independent variable which is financial factors, the item of Financial Factors 3 (Price of the product plays an important role in making decision to eat healthy food) has the greatest mean score (M=4.13, SD=0.892) while the item of Financial Factors 5 (Student from high-income family will choose expensive foods such as healthy foods compared to student from low-income family) has the least mean score (M=3.66, SD=0.954). Lastly, for the third independent variable which is physical activity factors, the item of Physical Activity Factors 4 (Is it important for every student to make healthy food choices for physical health care) has the greatest mean score (M=4.38, SD=0.703) while the item of Physical Activity Factors 6 (Climbing activities can prevent any dangerous diseases) has the least mean score (M=3.90, SD=0.831).

Result of Reliability Analysis

Table 3 shows the result of reliability analysis based on dependent variable and independent variables.

Table 25: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha
Healthy Food Choices	8	0.749
Psychological Factors	9	0.703
Financial Factors	7	0.823
Physical Activity Factors	8	0.873

Table 3 shows the result of the reliability analysis based on the dependent variable and each independent variable. The dependent variable which is healthy food choices with 8 questions has Cronbach's Alpha value of 0.749 which is good and acceptable. For the first independent variable, psychological factors with 9 questions shows Cronbach's Alpha value of 0.703 which is good, reliable and acceptable. The second independent variable, financial factors which contains 7 questions shows the Cronbach's Alpha value of 0.823 which is reliable and very good. The third independent variable, physical activity factors with 8 questions in the questionnaire provided has Cronbach's Alpha value of 0.873 which has very good internal consistency.

Result of Pearson Correlation Analysis

Table 4 shows the result of Pearson correlation analysis based on the hypothesis.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H1 - There is a significant relationship between psychological factor and healthy food choices among UMK students.	0.001	H1 is supported
H2 - There is a significant relationship between financial factor and healthy food choices among UMK students.	0.001	H2 is supported
H3 - There is a significant relationship between physical activities and healthy food choices among UMK students.	0.001	H3 is supported

Table 4 shows the result of Pearson correlation analysis based on the hypothesis. According to the results, the significant p-value of H1 is 0.001 which is below 0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson Correlation value of 0.420 stipulates the strength of the relationship between psychological factors and healthy food choices is moderate and the result is supported. Next, the significant p-value of H2 is 0.001 which is below 0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson correlation value of 0.752 stipulates the strength of the relationship between financial factors and healthy food choices is strong and the result is supported. Lastly, the significant p-value of H3 is 0.001 which is below 0.05 and the p-value is under 0.05. Thus, the study can reject the null hypothesis. Pearson Correlation value of 0.662 stipulates the strength of relationship between physical activity factors and healthy food choices is moderate and the results also is supported.

DISCUSSION AND RECOMMENDATIONS

Discussions are aimed at solving questions and addressing hypotheses as mentioned in the first section of this study. In general, the study has extensively researched the factors that affecting healthy food choices among wellness students at UMK. Based on the findings of the study, each individual has their own attitude and different mindset about healthy food. The result of psychological factors and the healthy food choices showed a weak correlation by using Pearson correlation. It showed students who have a lack of knowledge about food will affect their body. Students stated that they prefer to eat sugary foods when they are under stress especially if they have a lot of assignments to complete. This is because they can calm themselves down.

Students also usually eat without considering the nutritional value of the food. This unhealthy attitude will adversely affect student performance. One of the best options for choosing healthy food is to have healthy food by cooking it yourself. This is because students know the best ingredients, the cleanliness of the dishes and the quality of the food they eat. Besides, different family background and lack of guidance for have the healthy food choices make the result of the financial factors and the healthy food choices is very weak. Students have different perceptions about healthy food choices. From this research, some students from high-income families tend to choose expensive food and most students from low-income families tend to choose cheap food without looking at its quality. Furthermore, males showed higher functional health literacy, healthier eating choices, and more exercise and physical activity involvement than females.

The research findings are also essential for future research continuation. Thus, it is recommended that future research examines the factors that affecting healthy food choices among wellness students by the enlargement of this target population to wellness students in year 2 and year 4 to get the best result. This is because the students already learn and have the knowledge about nutrition, healthy food intake and the current issues in nutrition that are related to the study which is healthy food choices. Next, the researchers can use various types of survey methods to answer the questionnaires. For example, the researchers can use personal interviews which are face-to-face to get the fastest response from the respondents because will make it easier for the respondents to ask question and get immediate explanation if the respondents find any difficulty understanding the study.

Besides, the researchers can use multi-language for the questionnaire in the future research because it can help the respondents who are from different races that use different languages to easily understand the questionnaire and do not feel any pressure while answering it. In addition, the researcher can expand the study area among wellness students in the university campus as well as the rental house area to get more respondents involved for example from to the rental houses around UMK.

CONCLUSION

In conclusion, the study has accomplished to discover the factors that affecting healthy food choices among wellness students at UMK. Three independent variables, namely psychological factors, financial factors, and physical activity factors have been chosen to examine their relationships with the dependent variable, which is the healthy food choices. A total of 118 respondents from the age of 18 years old and from third years wellness programmer at Universiti Malaysia Kelantan, City Campus have been selected to examine their healthy food choices knowledge. Overall, based on Pearson's correlation analysis, financial factors have the strongest correlation followed by physical activity factors and the least psychological factors, represented by the following correlation (0.752 > 0.662 > 0.420).

ABSTRACT

Indigenous spas have initiated by providing therapeutic body treatments that incorporate ingredients taken in whole or in portions from indigenous traditions, which are presented for customers to respect the traditions. Therefore, the focus of this research is to analyse the knowledge and perception towards indigenous inspired spa among community in Kota Bahru, Kelantan. Moreover, most of the people have limited knowledge about indigenous spa and products. In this research, product knowledge, operation knowledge and service knowledge have been used as independent variables related with dependent variable perception towards indigenous inspired-spa among community in Kota Bharu, Kelantan. Research data have been gathered from 358 individuals from target population using validated questionnaire. The findings show that product knowledge, service knowledge, and operation knowledge have relationship with P-value less than 0.001 respectively. The results of the study are significant and thus support the hypotheses.

Keywords: Spa, Wellness, Indigenous spa, public knowledge, operation knowledge, service knowledge

INTRODUCTION

According to Stoewan (2017), wellness is defined as deliberate, self-contained, and ever-evolving process of realizing a person's full potential. Wellness is a multifaceted and holistic concept that encompasses a person's lifestyle, mental and spiritual well-being, as well as the environment. This wellness sector has grown in prominence in Malaysia from 2002, with a growth rate of over 200 percent from 2002 as per the Intelligent Spa (Yaman et al., 2012). As revealed by Oxford Business Group (2016), each year, the development accelerates, and in 2014, the wellness sector in Malaysia had a 10% increase. The wellness and spa industries are profitable and have a great prospect, with economic development, urbanisation, globalisation, health concerns, and religious acting as driving forces (Othman et al., 2015).

Jamaluddin, et al., (2018) points out that a spa is a facility that provides health and aesthetic treatments to those who want to restore, refresh, and rejuvenate their bodies. As revealed by Pavelka & Ell (2020), there are many types of spas. One of the various types of spas is indigenous spa. Indigenous spas are initiated by providing therapeutic body treatments that incorporate ingredients taken in whole or in portion from indigenous traditions, which are presented for customers to respect the traditions.

In addition, there are many indigenous spa treatments that have been passed down to generations of the indigenous people. Indigenous spas are run by indigenous people that incorporate traditional ways into spa experiences to provide consumers with non- exploitative advantages. Indigenous spa treatments can help with stress or other health issues by using nature products as wellness products. Indigenous spa offers treatments based on plants, flowers,

and other natural ingredients (Ell & Pavelka, 2020). Thus, an entrepreneur can begin an indigenous spa so that the community can know more about it.

This study consists of three objectives:
1. To examine the types of sources that the community in Kota Bharu, Kelantan uses for spa information.
2. To determine the level of knowledge on Indigenous inspired-spas among the community in Kota Bharu, Kelantan.
3. To identify the relationship between Indigenous inspired-spa knowledge (product, service, operation) and perception among community in Kota Bahru, Kelantan.

Significance of the study
Government

Research on indigenous wellness and spa products can provide knowledge to the community. Furthermore, this research can increase the economy of wellness tourism because health tourists are rising customers who can help preserve traditional cultures and natural assets. It can also encourage entrepreneurship because it is a form of wellness that can help increase the broader population's well-being (Global Wellness Institute, 2019). According to (Altman & Finlayson, 2003) governments around the world describe tourism, for instance, as the only promising economic option for indigenous people residents in remote areas.

Spa owners

This research could also be of interest to indigenous spa owners or spa operators. It is also to introduce or promote the products and services that indigenous people provide to the community. Besides, spa owners can also attract customers or tourists and improve the economy of the indigenous spa. According to other researchers, found that spa treatments with cultural aspects are becoming increasingly popular (Harrison, 2013). Therefore, spa owners have the opportunity to introduce products and devise strategies to promote indigenous spa products and services to the public.

Future researchers

This research can be used as a reference for future researchers. It is also for future researchers to study and discover new things. For future researchers, this may be the second tool using other types of methodologies to demonstrate knowledge influencing public perceptions of indigenous wellness and spa products. Hence, this theoretical framework covers foundations that help in more detailed research.

LITERATURE REVIEW
Indigenous inspired-spa product

Spas are well-known for offering a wide range of products that are accessible in different regions (Ada & Corrine, 2014). Spa products include to reducing tension and physical pains, boosting beauty and wellness, and enhancing self-esteem, emotional, and mental well-being (ISPA, 2007). Additionally, spa products come in a variety of forms which is wet to non-water-based which is dry and offer a variety of physical and psychological benefits (Ellis, 2014). According 'O' Brien (2015), items like spring water is consumed for spiritual reasons as well as to keep a healthy body, soul, and emotions balanced.

In Peninsular Malaysia, Orang Asli refers to the 18 tribes of indigenous and minority cultures who are divided into three groups such as Negrito, Senoi, and Proto Malays (Chan, 2018). These Orang Asli have their own distinct qualities, language, and way of life, and they live in the forest with natural traditions and customs (Abdullah et al., 2013). Spa product influences

consumers to consider the information available whether to find out about Indigenous spa products (Stanton, 2019). Product knowledge includes information on the product's features and benefits, as well as information about how satisfied customers are with the product (Tatiek Nurhayati, 2019). Spa products is products that can be regional marketing objects that give indigenous peoples promotion of their products (Dryglas, 2012). According to Sanggor (2018), products knowledge is a customer's impression of a product based on previous experience with that product. Product knowledge can influence a customer's perception of a product and how uses it.

Product knowledge also makes it easier to make decisions based on the information available (Stanton, 2019) perceptions about indigenous products. Customers, on the other hand, are not compelled to look for alternatives and information to consumer perceptions of products (Wang et al., 2020). According to Orga (2018), product knowledge is crucial since it aids any business in surviving in a competitive market, where product knowledge is used to produce competing abilities that align with the business plan. A solid business strategy necessitates adequate resources and excellent people who can effectively manage those resources.

Indigenous inspired-spa services

Services knowledge can be good information to community to use the indigenous spa. Spa services play an important role in managing the spa. Spa services need to be well designed to provide timely services to clients (Vila, 2021). A service that fulfils quality standards is one that meets and exceeds the expectations and satisfaction of customers (Harwiyati, 2019). Users of spa services should feel comfortable, safe, healthy, relaxed, and fit or wellness (Harwiyati, 2019). According to Manhas et al. (2019), different spas provide different types of services, such as medical therapy, but they all have the same goal, which is to provide consumers with emotions of wellness, wellbeing, and health (Suria et al., 2020). Spa services also provides specialised services to customers to use the services provided by the indigenous spa. For examples indigenous spa services provided traditional indigenous massages, flower baths, abstinence treatments and so on. Spa services are a criterion for the quality of treatment and recreation that is proven by objective examination methods and subjectively appreciated by the consumer (A, 2020). Spa services have a huge impact on customer decisions from marketing aspects, such as products, prices, locations, and promotions (NaRanong, 2019).

Spas that provide a variety of services are seeking for new consumer value propositions in order to attract new market groups, as spas have traditionally focused on their natural resources (Rosa et al., 2021) to draw customers' attention to the indigenous spa. Therefore, indigenous spas are also services performed during the treatment and rehabilitation phase which is part of the public health care services (Alexandr, 2013) that make spas an inspiration to the spa sector. The attraction services offered by indigenous spas are very useful to the community to restore health naturally (Alexandr, 2013).

Indigenous inspired-spa operation

Subsequently, operations management is a method used in organizations to generate spa product and services (Slack et al., 2013). Operations management converts inputs into goods and services based on the demands and interests of customers, with evident connections to spa products. The activity of managing the resources that generate and provide services and products that offer a unique visitor experience is often referred to as spa operation (Slack et al., 2013). The current spa operation combines traditional practices and beliefs with modern amenities and services (Imbong, 2021). Operations are made up of a variety of flexible ideas, including basic structures, uses, links with other mathematical structures, and future generalization (Boguská el al., 2015). Handling customer complaints, customer satisfaction,

and new operational aspects of the business in a variety of perspectives (Rizwan et al., 2020) can enhance the development of indigenous spas.

The operation of the spa is a combination of old customs and beliefs blended with contemporary facilities and services (Imbong, 2021). Indigenous spas may be less well known to the community but the operations they perform can give a good perception. The operation performed by the Indigenous spa provides benefits to the client in terms of time, place, and price. This is because, Indigenous spas have researched the problems faced by clients to come to the spa. Operational knowledge used repeatedly and continuously is to improve products and processes in Indigenous spa (Schuur, 2010). With original research, Indigenous spas have conducted spa operations better and systematically.

The Type of Sources

According to M. Elayyan (2020), the types of resources are divided into three which is primary sources, secondary sources, which provide interpretation, critique, analysis, or commentary. Additionally, tertiary sources, which provide a concise summary or distillation of a topic. Sources selected for use in research can usually be categorized according to types which is primary, secondary, and tertiary (J. Alderman, 2014).

According to M. Brilliant (2022), in certain circumstances, primary sources can be discovered on microfilm reels, digital collections on the internet, or library stacks, such as ancient books, newspapers, journals, etc. Newer communication technologies have expanded people's options for sending and receiving information. One such tool that has found greater use as a source of information is the internet (Pepitone, 2010).

Subsequently, secondary sources are formed by taking main sources and examining them in order to uncover additional information or develop new connections. Furthermore, secondary sources are published in academic journals or books, and they give extra resources for other scholars to use in their own study. Normal academic research will start with a literature review, which is a methodical examination of what has been published on a certain topic at the time the present study is being conducted. Based on the literature review, the study will focus on primary sources that can be further explained considering previous research and the investigator's own interpretations of the original materials (J. Alderman, 2014).

Tertiary sources are typically synthetic in character, bringing together a number of disparate but connected perspectives of same event, issue, body of knowledge, and etc. Tertiary sources are useful beginning places for research projects since it aids in the distillation of enormous volumes of data. Usually, footnotes in tertiary sources steer researchers in the right way when it comes to secondary sources (M. Brilliant, 2022).

Perception toward indigenous-inspired spa

Perception is a psychological process in which individuals can process responses into positive or negative perceptions based on experiences gained through the five senses. The process of selection, interpretation, and reaction are used to elicit responses (Erin, & Maharani, 2018). According Ghadirian et al., (2017), defined perception as a set of actions for gathering information. This acquisition can result from the environments to which they are exposed. Perception is information about objects, events, or relationships derived from inferring information and interpreting messages. Perception, on the other hand, is the ability of the senses to translate stimulus or the process of converting stimulus into human senses. There is a distinction between sensing something that is good or positive perception and sensing something that is negative perception that will affect human action in human perception

(Kuswarno et al, 2017). Shape and color, as well as meaning and semantic relationships between objects, influence perceptions in the visual world (Pomplun et al., 2011).

Perception is a personal manifestation of how a person sees the world, which is influenced by a variety of sociocultural factors. As a result, people from different cultures have very different perceptions of themselves and others. This distinction can be seen when two cultures are compared. When two cultures collide, the nature of individual experiences can be influenced. When the ethnicity of the women giving birth differs from the main ethnicity of the attendants, perceptions of pain during childbirth increase (Ojengbede et al, 2009).

Research Hypotheses

In this study, there are three hypotheses related to identifying the relationship between product knowledge, services knowledge, operation knowledge, and perception toward Malaysian indigenous wellness and spa products.

H1: There is a significant relationship between product knowledge and perception towards indigenous inspired-spa.

H2: There is a significant relationship between service knowledge and perception towards indigenous inspired-spa.

H3: There is a significant relationship between operation knowledge and perception towards indigenous inspired-spa.

Conceptual Framework

The independent variable used is related to knowledge which is knowledge of products, services, and operations in Indigenous-inspired spas. Thus, by reference to the literature review, a research framework has been proposed for investigated the knowledge and perception towards Indigenous-inspired spa among community in Kota Bharu, Kelantan.

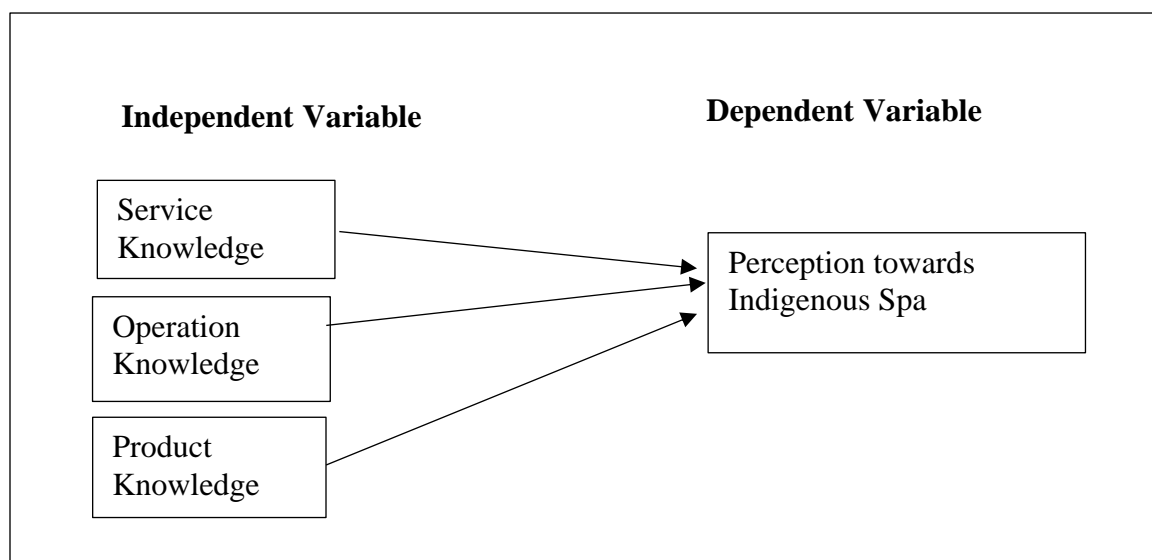

Figure1: Research Framework

METHODOLOGY

Research Design

The study of this research used quantitative research approach to identify the knowledge and perception towards Indigenous-inspired spa among community in Kota Bharu, Kelantan. A cross-sectional study design was used to measure the knowledge and perception towards Indigenous-inspired spa among community in Kota Bharu, Kelantan, and independent variables which is product knowledge, service knowledge as well as operation knowledge.

Data Collection

The online survey approach is used to gather data collection for this study, which is done using a Google Form. In this study, a total of 358 respondents have involved in answering the questionnaires provided. Following their agreement to complete the questionnaire, respondents will be provided an explanation. There was no compulsion to respond to the study's questionnaire.

Sampling Method

The researcher uses non-probability sampling in this study which is purposive sampling and convenience sampling. The researcher uses this sampling to find out the specific characteristics that exist in the population of the study. The researcher clearly explains the rationale of the study to the respondents before they answer the questionnaire so that the respondents know the purpose of this study.

Data Analysis

Data analysis used in this study consists of descriptive analysis, reliability analysis and Pearson Correlation. The data collected from the questionnaire have been analysed using the IBM Statistical Program for Social Science (SPSS) version 25 computer software package. The researcher can utilise data analysis tools to process and alter data, examine linkages and correlations between data sets, and uncover patterns and trends that can be interpreted.

FINDINGS

Demographic Profile of Respondents

Table 1 below shows the frequency analysis of this research.

Table 1: Respondents' Socio Demographic Profile (N=358)

Demographic profile characteristic		Frequency	Percentage (%)
Gender	Male	87	24.3
	Female	271	75.7
Age range	17 - 21 years old	22	6.14
	22 - 26 years old	323	90.2
	27 - 31 years old	5	1.4
	32 - 36 years old	5	1.4
	37 - 41 years old	3	0.8
	Mean age: 23.16		
Marital status	Single	331	7.3
	Married	26	92.5

	Divorce	1	0.3
Educational level	SPM	20	5.6
	Diploma	44	12.3
	Degree	292	81.6
	Master	1	0.3
	PhD	1	0.3
Race	Malay	324	90.5
	Chinese	6	1.7
	Indian	19	5.3
	Other	9	2.5
Occupation	Employed	60	16.8
	Unemployed	288	80.4
	Business owner	10	2.8
Household income	Less than RM1000	287	80.2
	RM1001 – RM 3000	54	15.1
	RM3001 – RM5000	10	2.8
	RM5001 – RM7000	3	0.8
	RM7000	4	1.1

Table 1 shows the descriptive statistics of respondent's demographic profile. The table indicates that the total number of respondents in this survey is 358. The total number of male respondents are 87 (24.3%) while 271 (75.7%) are female respondents. This shows that more female respondents had answered the survey as compared to male respondents. The majority of the respondents come from young adults (23 years old) in comparison to other age groups.

Furthermore, the highest number of marital status category which has responded to this questionnaire was from the single category with the frequency of 331 respondents with value of 92.5% whereas the lowest was respondents from the divorce category with frequency of 1 respondent and 0.3%.

The 358 respondents from different levels of education which are SPM, Diploma, Degree, Master, and PhD. Based on the table, the highest number of respondents are from Degree holders which consisted of 292 respondents with value of 81.6%. Masters and PhD holders are 1 respondent for both levels with value of 0.3%. There are 3 main different races in this survey. The highest number of respondents are Malays which consisted of 324 respondents with a value of 90.5 percent. The lowest are from Chinese which are 6 respondents with a value of 1.7 percent. The Malay respondents answer the questionnaire mostly because majority of people in Kelantan are Malays. Other than that, there are three categories of occupation in this survey which are employed, unemployed and business owner. The majority number of respondents answer the survey is unemployed respondents who are 288 respondents with value of 80.4 percent.

Section B in the questionnaire shows different variables of customer characteristics of spa in Malaysia like the types of information sources about spa visited, number of times visited a spa in the past, spa treatment or services used and reasons for visiting the spa.

Descriptive Analysis

Table 2 shows the descriptive statistics about distribution of information sources about spa.

Table 2: Distribution of information source about spa

Characteristics	n	%
Internet	285	79.6
Spa	26	7.3
Flyers/ pamphlet	15	4.2
Television	8	2.2
Newspaper	2	0.6
Words of mouth	22	6.1

Besides that, there are six categories in the information sources about spa visited. Most of the 285 respondents with the value of 79.6% have answer the survey internet. The less number was 2 respondents with the value of 0.6% who knew the information source about spa visited through newspaper.

Table 3 below shows the descriptive statistics for independent variable Product knowledge, service knowledge, operation knowledge and dependent variable perception towards indigenous-inspired spa.

Table 3: Mean, standard deviation of item and variable

Variable	Items	Mean Score	Standard Deviation
Product Knowledge	The indigenous-inspired spa products are designed to nurture all skin types.	4.08	0.78
	The indigenous-inspired spa body products include essential oils, soap bars, and sanitizer.	3.90	0.87
	Products used in the provision of indigenous-inspired spa treatments are all organic.	4.09	0.80
	The indigenous-inspired spa products are infused with wild-crafted botanical ingredients.	3.96	0.83
	The indigenous spa products are inspired by plant-based traditions only	3.97	0.84
Service Knowledge	The service concept of an Indigenous-inspired spa is designed to enrich the mind, body, and soul	4.14	0.79
	Indigenous-inspired spas provide wellness treatments that spotlight elements found in	4.05	0.80

325

	natural resources such as botanicals and stones.		
	Spa services offered in the indigenous-inspired spa utilize the ancient medical practices heritage.	4.03	0.81
	The indigenous-inspired spa treatment and services are not necessarily from native traditions.	3.91	0.91
	Warm herbal massages and traditional yoga are examples of wellness treatments in Indian Indigenous spas	3.94	0.85
Operation Knowledge	Indigenous-inspired spa guests connected with the natural surroundings to create a deeper sense of spirituality.	4.06	0.78
	Indigenous-inspired spa protocol involves greeting the client with a traditional ritual at the entrance	3.94	0.89
	Indigenous-inspired spas cannot be considered luxury spas as they provide treatment featuring local products and traditional healing.	3.85	0.92
	The indigenous-inspired spa should be managed by indigenous people only.	3.55	1.12
	Spa operation involved in the indigenous-inspired spa done without using a modern technology.	3.85	0.91
Perception towards Indigenous-inspired Spa	I believe the price of indigenous-inspired spa treatments is very reasonable and appropriate	4.08	0.80
	I believe the indigenous-inspired spa provides affordable treatment costs.	4.10	0.81
	I believe receiving treatment at the indigenous inspired spa can provide relief.	4.08	0.79
	I believe in the wellness advantages of an indigenous-inspired spa.	4.06	0.80
	I believe in the goodness of indigenous-inspired spa treatments.	4.06	0.76
	I believe the ingredients of indigenous-inspired spa products are safe and chemical-free.	4.10	0.78

The first item in the independent variable of Product knowledge is "The indigenous-inspired spa products are designed to nurture all skin types" has the mean of 4.08 (SD= 0.78) which is at the agree level. "The indigenous-inspired spa body products include essential oils, soap bars, and sanitizer" is the second item of Product knowledge. It has the lowest mean which is 3.90 (SD= 0.87) and is at agree level. The third item is "Products used in the provision of indigenous-inspired spa treatments are all organic" has the highest mean of 4.09 (SD= 0.80) which is at the level of agree. The fourth item is "The indigenous-inspired spa products are infused with wild-crafted botanical ingredients has the mean of 3.96 (SD= 0.83) which is at the agree level. The fifth item is "The indigenous spa products are inspired by plant-based traditions only". It has the mean of 3.97 (SD= 0.84) which is at the agree level.

Furthermore, the first item in the independent variable of Service knowledge is "The service concept of an Indigenous-inspired spa is designed to enrich the mind, body, and soul". It has the highest mean of 4.14 (SD= 0.79) which is at the level of strongly agree. "Indigenous-inspired spas provide wellness treatments that spotlight elements found in natural resources such as botanicals and stones" is the second item of service knowledge. It has the mean of 4.05 (SD= 0.80) which is at the agree level. The third item of service knowledge is "Spa services offered in the indigenous-inspired spa utilize the ancient medical practices heritage" has the mean of 4.03 (SD= 0.81), which is at the level of agree. The fourth item is "The indigenous-inspired spa treatment and services are not necessarily from native traditions". It has the lowest mean of 3.91 (SD= 0.91) which is at the level of agree. Item "Warm herbal massages and traditional yoga are examples of wellness treatments in Indian Indigenous spas" has the mean of 3.94 (SD = 0.85) which is at the agree level.

Besides that, the first item in the independent variable of Operation knowledge is "Indigenous-inspired spa guests connected with the natural surroundings to create a deeper sense of spirituality". It has the highest mean which is 4.06 (SD = 0.78) which is at the agree level. The second item is "Indigenous-inspired spa protocol involves greeting the client with a traditional ritual at the entrance" has the mean of 3.94 (SD= 0.89) which is at the agree level. Item "Indigenous-inspired spas cannot be considered luxury spas as they provide treatment featuring local products and traditional healing" is the third item. It has the mean of 3.85 (SD= 0.92) which is at the level of agree. The fourth item is "The indigenous-inspired spa should be managed by indigenous people only". It has the lowest mean of 3.55 (SD= 1.12) which is at the neutral level. The fifth item is "Spa operation involved in the indigenous-inspired spa done without using a modern technology" has the mean of 3.85 (SD= 0.91) which is at the agree level.

Other than that, the first item in the dependent variable of Perception towards indigenous-inspired spa is "I believe the price of indigenous-inspired spa treatments is very reasonable and appropriate". This item has the mean of 4.08 (SD= 0.80) which is at the agree level. The second item is "I believe the indigenous-inspired spa provides affordable treatment costs". It has the highest mean of 4.10 (SD= 0.81) which is at the level of agree. The third item is "I believe receiving treatment at the indigenous-inspired spa can provide relief." which has the mean of 4.08 (SD= 0.79). It is at the level of agree. "I believe in the wellness advantages of an indigenous-inspired spa" is the fourth item of perception. It has the lowest mean of 4.06 (SD= 0.80) at the level of agree. The fifth item is "I believe in the goodness of indigenous-inspired spa treatments". It is also having the lowest mean of 4.06 (SD= 0.76) which is at the agree level. The last item of perception is "I believe the ingredients of indigenous-inspired spa products are safe and chemical-free". It has the highest mean of 4.10 (SD= 0.78) which is at the agree level.

Table 4 shows the descriptive statistics of level of knowledge

Table 4: Descriptive Analysis (n=358)

Knowledge of Indigenous-inspired spa	Level of knowledge	
	Poor n (%)	Good n (%)
Product knowledge	149 (41.6%)	209 (58.4%)
Service knowledge	150 (41.9%)	208 (58.1%)
Operation knowledge	183 (51.1%)	175 (48.9%)
Overall knowledge	172 (48.0%)	186 (52.0%)

To determine the level of knowledge for each dimension, the summative score of each was converted to a binary variable using the mean as the cut-off point. The level of knowledge was categorized either poor or good knowledge. The mean cut-off point for product knowledge was 4.09 (1.24), service knowledge was 4.07 (1.54), and operation knowledge was 3.65 (2.67). As shown in Table 4.5, a total of 209 (58.4%) of 358 respondents were very confident about the level of knowledge regarding the Indigenous-inspired products, 208 (58.1%) were fairly confident about the Indigenous-inspired services, 175 (48.9%) knew well about the Indigenous-inspired spa operation.

Reliability Analysis
Result of Reliability Analysis
Table 5 below shows the reliability analysis of this research.

Table 5: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Product Knowledge	5	0.707
Service Knowledge	5	0.895
Operation Knowledge	5	0.908
Perceptiontowards Indigenous-inspired Spa	6	0.854

Table 5 above demonstrates the reliability of four variables. Cronbach's Alpha used to examine the reliability of the 21 items and used to measure the four constructs.In addition, the results in table 3.7.2 show that the reliability of each construct ranges from 0.707 to 0.908. The Alpha Coefficient of 0.6 is set as the minimum criterion. With an alpha coefficient of 0.707, the construct of tangible features fulfilled the minimal criterion. As a result of the pilot test, except for the tangible satisfactory internal consistency reliability for each construct, the overall result was acceptable and more reliable. According to the results, operation knowledge has the highest coefficient of 0.908, while product knowledge has the lowest coefficient of 0.707.

Result of Pearson Correlation Analysis

Table 5.1: Pearson Correlation Analysis Result

Variables	R-value	P-value	Research hypothesis	Evaluation of test
Product knowledge → Perception	0.652	0.000	H1	Hypothesis was accepted

Service Perception	knowledge	→	0.660	0.000	H2	Hypothesis was accepted
Operation Perception	knowledge	→	-0.511	0.000	H3	Hypothesis was accepted

** Correlation is significant at the 0.01 level (2-tailed).

Table 5.1 displays Pearson Correlation Coefficient, significant value and the number of respondent community of Kelantan which is 358. The correlation coefficient of 0.652 suggested a moderate positive correlation relationship between product knowledge and perception towards Malaysian indigenous inspired spa. The p-value of product knowledge is 0.000 which is less than the highly significant level is 0.01 as it reveals. Therefore, there is a significant positive relationship between product knowledge and perceptions towards indigenous inspired-spa among community in Kota Bharu, Kelantan.

The correlation coefficient of 0.660 suggested a moderate positive correlation relationship between service knowledge and perception towards Malaysian indigenous inspired spa as a wellness tourism product. The p-value of service knowledge is 0.000 which is less than the highly significant level is 0.01 as it reveals these results suggest a significant positive relationship between service knowledge and perception towards indigenous inspired-spa among community in Kota Bharu, Kelantan.

The correlation coefficient of -0.511 suggested a moderate positive correlation relationship between operation knowledge and perception towards Malaysian indigenous inspired spa. The p-value of operation knowledge is 0.000 which is less than the highly significant level is 0.01 as it reveals. Therefore, there is a significant relationship between operation knowledge and perception towards indigenous inspired-spa among community in Kota Bharu, Kelantan.

DISCUSSION AND RECOMMENDATIONS

This study builds a new avenue by highlighting the recommendations of proposals for potential research advances. This recommendation could provide a double benefit for new research on the impact of attitude on intention to visit indigenous spa products and services, as well as revise research on the impact of attitude on intention to visit indigenous spa products and services.

Firstly, it is recommended for future researcher to change existing data collection methods to qualitative method. Qualitative research generates data in a different way that quantitative research seems not to. Interviews, observations, and document analysis are examples of qualitative data. The key supporters in validating the fieldwork conducted in the qualitative study are field notes and researcher diaries. Future researchers are recommended to use qualitative methods such as telephone surveys and face-to-face interviews in their research.

Furthermore, future researchers should collect data by expanding the study area to include public employees, private employees, housewife, and teenagers among singles, instead of focusing solely on university students. This allows future study to collect data from a larger group of people and areas in order to gather facts and evaluate them more thoroughly. The information gathered will also be more effective and precise in determining attitudes of aboriginal spa products and services.

Future researchers can renew, improve, and reproduce the journal in the future. Researchers compared data from western countries using standard journals in this investigation. As a result, cultural differences between Western and Eastern students may reflect in them having different

perspectives and making different recommendations, resulting in a biased situation. Google Scholar and my Athens can be utilised to find out more about attitudes toward the intention to visit aboriginal spa products and services.

CONCLUSION

In conclusion, the research has found that the three hypotheses in this research are accepted. All the independent variables show different correlation coefficient with the dependent value, which are 0.652 for product knowledge, 0.660 for service knowledge and -0.511 for perception towards indigenous-inspired spa. These results show a moderate positive correlation for product knowledge, service knowledge and operation knowledge between the dependent variable. It also answers the research questions whether or not there is any relationship between independent variables and dependent variables. Therefore, to conclude, there is a significant relationship between product knowledge, service knowledge, operational knowledge, and perceptions of Indigenous-inspired spas.

ABSTRACT

Spa and wellness centers that offered products and services according to indigenous people's approach are branded as indigenous-inspired Spa Therapy. The attitudes shown by the people are also different and this shows and gives rise to the diversity of opinions that exists in every aspect. The perception shown by outsiders towards the new concept of indigenous spas in the spa industry can improve and change their perception of the advantages that exist in this indigenous spa. Therefore, this study aims to measure the influence of spa-goers' perceptions and attitudes on emerging indigenous spa therapy. There were a total of 385 respondents who participated in this study which has been conducted online using questionnaires survey. This study focuses on the community in Kelantan using a convenience sampling method. The result shows that there is a significant relationship between the perception and attitude of spa-goers towards the indigenous-inspired spa.

Keywords: Wellness tourism, Indigenous spa, perceived cost, perceived benefits, perceived trust

INTRODUCTION

A spa is commonly known as a place where men and women go for health and beauty treatments. The Indigenous spa is using materials for treatment with chemical-free organic matter. Indigenous spa services do not use modern equipment and the aboriginal spa environment is a village atmosphere that is full of flora. This chapter highlights the study background, problem statement, research objectives, research questions, the significant of the stud, and the definition of terms.

Tourism is a broad term that encompasses a variety of social, economic, and cultural phenomena. According to the United Nations World Tourism Organization, tourism has become a more complicated phenomenon with political, economic, social, cultural, and educational implications. Tourism refers to the actions of individuals who go to and live in places outside of their typical surroundings for a variety of reasons, including leisure, business, and others. Travel for business or health reasons might be mixed with cultural travel. Tourism is viewed as one of the keys to creating a deeper knowledge of Malaysia's multi-ethnic population's varied cultures and lifestyles. The spa industry has grown to become the fastest-growing leisure sector, offering amenities for improving one's health and well-being. Tourism has been more popular in recent years.

Wellness tourism combines wellness culture, tourism resources, and the natural environment. It promotes a healthy lifestyle for visitors, allowing perseverance of physical, mental, and spiritual well-being. Travelers seek wellness treatment, such as massage, to rest their mind and body. Tourists are rapidly recognising wellness tourism as a terrific method to improve general health, and it has become a major industry around the world. Wellness tourism can be described in a wide sense that considers people's lifestyles and how they relate to many societal and

individual elements (Dunn, 2017). Tourism has also long been promoted due to its potential to revitalize aboriginal communities and preserve aboriginal cultural heritage. The physical, mental, and social aspects of an individual's well-being are all intertwined to create a state of harmony and spirituality.

The spa is a wellness treatment centre for people who desire to refresh, restore, and revitalise their bodies. Herbal and botanical substances, such as minerals in mud treatments or herbal and botanical essences in massage oils, are used in Traditional Chinese and Thai Medicine (TCM and TTI) to cleanse the skin and soothe the mind as part of wellness therapies. The therapist may utilise mindfulness, breathing exercises, and other therapeutic tactics to engage the parasympathetic nervous system (PNS), which calms hyper-aroused stress-induced states (Jia Wei Lim & Tang Ching Lau,2018). Traditional medicine based on natural materials is often used in indigenous spas. The integration of aboriginal treatments into spa therapy is increasing. There are research on aboriginal communities to support cultural spa tourism that has the potential to contribute to cultural preservation (Walsh, J. 2012). The aboriginal-inspired spa is an organisation that offers healing body therapies that incorporate elements derived in whole or in part from aboriginal traditions. Treatments at the indigenous spa feature healing therapies based on produce from the surrounding forest and indigenous spa will provide treatments based on plants, flowers and natural ingredients. In Malaysia there are various races and cultures that introduce various types of traditional treatments, one of which is the indigenous spa which is conquered by the aborigines.

Therefore, this study was designed to investigate people especially the spa goers' perception and attitude towards the existence of indigenous spa. The perceptions on indigenous spas influence the change in attitudes shown by spa customers. Changes in people's attitudes especially the attitudes of customers shown will influence the spread of the existence of indigenous spas. With the good spread of the existence and also the perceived advantages in terms of acceptance of indigenous spas, it indirectly enhances progress in the lives of indigenous people.

The objective of this report:

1. To identify the relationship between perceived cost and attitude of spa-goers towards indigenous spa therapy.
2. To identify the relationship between perceived benefits and attitude of spa-goers towards indigenous spa therapy.
3. To identify the relationship between perceived trust and attitude of spa-goers towards indigenous spa therapy.

Significance of The Study

Community

This research will provide new insight into the emerging indigenous spa therapy to the community. Through this study, people will become aware of the benefits and greatness of this indigenous spa. This is because most natives still use healing therapies based on produce from the surrounding jungle. One way to make people become aware of the indigenous spa is by spreading information to the community in the form of pamphlets. Upon completion of this research, the findings will be published to provide information and awareness to the community. Therefore, this will help to measure the community's perceptions and attitudes towards the indigenous spa.

Authority

Next, the government will be able to promote indigenous spa therapy as the new emerging wellness tourism industry to the public. There is data that will be collected relating to the indigenous spa during the conduct of this study and it will be published for general reading. Through the data collected, the government also can implement a good strategy to promote the indigenous spa to encourage the wellness tourism industry. As a result, the government may be able to benefit from an increase in revenue generated by the wellness tourism industry.

Researcher

Students, academicians, and researchers who are interested in indigenous spas in the future can benefit from this research. This is because not many researchers research indigenous spas. This study will provide a lot of information about indigenous spas. Also, this research contributes to empirical results that can be referred by other researchers. This study aimed to measure the influence of spa goers' perceptions and attitude toward the indigenous spa. The students and researchers will be able to comprehend the perceived cost, perceived benefits, perceived trust and attitude. This theoretical framework provides the foundations for future academics to do more detailed research.

LITERATURE REVIEW

Perceived Cost

According to a definition provided by Wang et al (2020) perceived cost is defined as a negative function of what is sacrificed. The costs operate as deterrents to joining social movements or protests, but the advantages work as motivators.

The consumer may be afraid to give a try to indigenous spa therapy because of their perception on the indigenous people. Moreover, indigenous spa therapy is the new emerging spa which makes the customer need more exposure to give it a try.

Opportunity cost, which refers to the perception that other valued activities must be sacrificed to complete the task (Perez et al 2019). This is very closely related to a person's attitude, when the person does not know about the indigenous spa, he or she will view it in a negative view.

Perceived Benefits

The spa industry benefits from instruction on how to choose which cultural elements to incorporate in a spa's range of services and how to do it appropriately. The massage characterized as a rhythmic linty body massage inspired by traditional indigenous techniques, is one such therapy on the menu of service. It is aimed to rebalance and re-align energy flow, increasin mind and body wellness. A unique blend of native aromatic oils will revitalize, harmonies or detoxify the body (Emily Fm Fitzpatrick, 2019).

According to studies, soaking in warm water lowers cortisol levels in the body, and tissue massage relieves built-up stress that presents as tense muscles in the neck and shoulders. The muscles relax as a result of the release of stress, and the mind relaxes as well. It also reduces headaches by releasing tension in the head and neck. Adding aromatherapy to the foot spa experience enhances the sense of relaxation by acting on several senses simultaneously (Laura D. Ell, 2020).

Perceived Trust

The community's perceived trust toward the spa is that women are more likely to visit the spa. According to Trihas and Konstantarou (2016), women are mainly involved in wellness

activities. Customers will be more likely to try something when trust in it. One of the most crucial parts of business-to-business and business-to-customer engagements has always been trust (Aziz et al 2018). People trust that treatments at a spa can provide relief and reduce stress. Trihas and Konstantarou (2016) claims that stress reduction is the number one reason people are likely to visit spas, followed by relaxation, rejuvenation, fitness, wellness, improved quality of life, pain reduction and an all-around experience.

Attitude towards Indigenous Spa

According to Erin (2015), the attitudes shown by outsiders towards indigenous peoples are often negative. In changing outsiders' views on indigenous peoples, relationships such as interpersonal relationships can influence the positive attitudes that will be displayed.

The existence of the indigenous spa will show how did people accept the spa and showing their attitudes towards the spa. Based on an article by Laura (2020), there are a lot of advantages of a spa that can be seen as a positive attitude from outsiders and well received. The native spa can provide advantages that no other regular spas may do. For example, people tend to show different attitudes once the benefit of the treatment given by an indigenous spa is different from the other spa in the spa industry.

Research Hypothesis

H1	There is a significant relationship between perceive cost and the attitude of spa-goers towards indigenous spa therapy
H2	There is a significant relationship between perceive benefits and the attitude of spa-goers towards indigenous spa therapy
H3	There is a significant relationship between perceive trust and the attitude of spa-goers towards indigenous spa therapy

Research Framework

Figure 1 below shows the research framework used for this study.

Figure 4: Research Framework

METHODOLOGY

Research Design

This study used the quantitative research approach to study the relationship between perceptions and attitudes of spa-goers towards emerging indigenous spa therapy (Akhtar, 2016). The method used by the researcher to collect data is by giving questionnaires that are distributed to 384 selected respondents. The respondents were chosen by non-probability sampling technique, and the study's target population is the Kelantanese community. Our target for this study of the indigenous spa is women from the working class, housewives and single mothers. Women from the working class, housewives, and single mothers are our target demographic for this indigenous spa study.

The questionnaire for this data collection process contains 3 part which is part A, part B and part C. Part A related to the demographically question that related to the respondent. Part B asked about independent variable of the study which is the perception of the indigenous spas. Those question in part B are significantly related about the perception of cost, benefit, and trust given by the indigenous spas towards the community. In part C, the questions given are about the dependent variable of the study which is the attitude shown by the community towards indigenous spas. The questions elaborated more on the independent variable and dependent variable which were (i) perceived cost, (ii) perceived benefits, and (iii) perceived trust that were examined in the survey. The quantitative research approach, using a cross-sectional study design was used to measure the relationship between attitudes towards indigenous spa therapy and independent variables namely perceived cost, perceived benefits and perceived trust.

Data Collection

The data collection was conducted using questionnaires survey. This study chose to distribute the questionnaires using the Google form application. Lu, L. S. (2020) the questionnaire or survey distribute through WhatsApp group, Telegram group and social media that can reach potential respondent that represent the whole population which is community in Kelantan. The questionnaires was distributed openly to all target respondents and there was no coercion or obligation to the person to whom these questionnaires were distributed. It was very convenient to minimise cost, save time and significantly applicable during this pandemic outbreak.

Sampling

The sampling method used in this was the non-probability sampling technique to select the state and district as well as convenience sampling in selection of respondents, while 358 respondents were chosen. Non-probability sampling is a process that selecting a sample from the population using the principle of randomization, often known as random selection or chance. The study used this method because questionnaires were prepared and distributed online or posted them to social media pages to gather information from the respondents. The sample size of the research is determined based on Krejcie & Morgan (1970) table (Appendix 1) that used a fix formula for an estimated population. The selected respondent focuses on residents living in the city of Kelantan to get views on the indigenous community in Kelantan, chose this respondent because it is easily accessible. The formula of this equation is as follows:

$$s = \frac{x^2 N_P (1-p)}{e^2(N-1) + X^2 p(1-p)}$$

n = sample size
N = population size
e = the degree of accuracy expressed as proportion (0.05)
x^2 = chi-square of degree of freedom 1 and confidence 95% (3.481)

p = proportion of population (if unknown, 0.5)

Data Analysis

There were two types of data analysis used in this study, namely Pearson correlation analysis and descriptive analysis and bivariate data analysis. The data obtained was analysed by The Statistical Package for the Social Sciences (SPSS) version 26.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the result of frequency analysis of this research.

Table1: Frequency Analysis Results

Characteristic	Frequency	Percentage
Gender		
Male	88	24.6
Female	270	75.4
Age range		
17 – 21 years old	22	6.1
22 – 26 years old	322	89.9
27 – 31 years old	6	1.7
32 – 36 years old	5	1.4
37 – 42 years old	3	0.8
Marital status		
Married	25	7.0
Single	332	92.7
Divorce	1	0.3
Educational level		
SPM	21	5.9
Diploma	45	12.6
Degree	290	81.0
Master	1	0.3
PhD	1	0.3
Race		
Malay	324	90.5
Chinese	6	1.7
Indian	19	5.3
Other	9	2.5
Occupation		
Employed	62	17.3
Unemployed	286	79.9
Business owner	10	2.8
Household income		
Less than RM1000	288	80.4
RM1001 – RM3000	53	14.8
RM3001 – RM5000	10	2.8
RM5001 – RM7000	3	0.8
RM7000 and above	4	1.1
Number of times visited spa in the past		
Never	103	28.8
1 – 3 times	215	60.1

4 – 6 times	28	7.8
7 – 10 times	3	0.8
More than 10	9	2.5
Service/treatment used		
Body massage	137	38.3
Sauna	85	23.5
Foot massage	108	30.2
Scrub	80	22.3
Face/head massage	180	50.3
Traditional and complementary medicine	73	20.4
Reasons for visiting spa		
Stress relief	267	74.6
Physical health	123	34.4
Beauty service	151	42.2
Anti-aging treatment	52	14.5
Nosiness	12	3.4
Loss weight	27	7.5
Others	4	1.1

Table 1 illustrate the result of frequency analysis of socio demographic characteristic. The total number of respondents for male was 88 (24.6%) while the number of female was 270 (75.4%). This study used convenience sampling method which mean that anyone who has the desire to answer the question, can answer it. In this study, more female was interested to answer the questionnaire.

The distribution based on age shows that 22 respondents (6.1%) were between 17-21 years old, 322 respondents (89.9%) were between 22-26 years old, and 6 respondents (1.7%) aged from 27-31 years old, 5 respondents (1.4%) were from 32-36 years old, and 3 respondents (0.8%) are among 37-41 years old. Majority of the respondents were between age 22-26 years old. This is because the community in Kelantan was not very skilled in the field of information and technology (IT), since most of the people who live there are the elders.

Referring to marital status, 322 respondents were single (92.7%) and 25 of the respondents were married which is 7%. Only 1 respondent was divorced (0.3%). The majority of the respondents were single because their age was between 22 – 26 years old. There were 21 respondents (5.9%) from SPM, 45 respondents (12.6%) of diploma, 290 respondents (81%) from degree and 1 respondent (0.3%) from master and PhD respectively. The majority of respondents are from undergraduate students as this research is conducted in universities that have many undergraduate students. In addition, this questionnaire was disclosed to most students in community in Kelantan.

For the analysis of the respondents by race, 324 (90.5%) respondents are Malays, 6 respondents are Chinese (1.7%), 19 respondents are Indian (5.3%) and 9 respondents (2.5) are from another race. The highest number of the respondents by race is Malay because the community in Kelantan is mostly Malays compared to other races.

Next, 62 respondents are employed (17.3%), 286 respondents are unemployed (79.9%) and 10 respondents are business owner (2.8%). The majority of respondents are unemployed because this questionnaire was widely distributed to the students that live in Kelantan.

The total numbers of respondents who earn less than RM1000 was 288 respondents (80.4%). 53 respondents (14.8%) earn RM1001-RM3000, 10 respondents (2.8%) earn RM3001-

RM5000, 3 respondents (0.8%) earn RM5001-RM7000 and 4 (1.1%) respondents earn RM7000 above. This is because the respondents who are willing to answer this questionnaire were from students who were not working.

The analysis of respondents showed that there were 103 respondents (28.8%) who never visited a spa. About 215 respondents (60.1%) visited 1-3 times, 28 respondents (7.8%) visited 4-6 times, 3 respondents (0.8%) visited 7-10 times and 9 respondents (2.3%) visited more than 10 times. Besides that, the reasons for visiting spas were for stress relief which was 267 (74.6%), followed by beauty service, 150 (42.2%). The least reasons were nosiness and others, 12 (3.4%) and 4 (1.1%) respectively. The reasons why respondents visit a spas for stress relief because of a calm, relaxing, quiet spa environment that can give relief to a tired mind and body.

Result of Descriptive Analysis
Table 2 below shows the result of descriptive analysis of this research.

Table 2: Descriptive Analysis Results

Variable	Items	Means score	Standard deviation
Perceived cost	I believe the price of indigenous-inspired spa treatments is very reasonable and appropriate.	4.08	0.80
	I believe the indigenous-inspired spa provides affordable treatment costs.	4.09	0.81
	It will take a big amount of effort to pay for the treatment at an indigenous-inspired spa.	3.89	0.87
	I think the price offered at indigenous spas is more expensive than other spas.	3.58	1.03
	I believe I will get the treatment that is worth the cost to be paid in the indigenous-inspired spa.	3.88	0.81
Perceived benefits	I believe receiving treatment at the indigenous-inspired spa can provide relief.	4.08	0.79
	I believe in the wellness advantages of an indigenous-inspired spa.	4.05	0.81
	I believe the services received from the therapist in the indigenous-inspired spa are excellent.	4.02	0.80
	I believe the products and services provided in the indigenous-inspired spa are valuable.	4.08	0.78
	I believe the indigenous-inspired spa does not have any wellness benefits.	3.56	1.18
Perceived trust	I believe in the goodness of indigenous-inspired spa treatments.	4.05	0.76
	I believe the ingredients of indigenous-inspired spa products are safe and chemical-free.	4.10	0.78
	I believe in the results of the treatments provided by indigenous-inspired spa therapists.	4.07	0.81

	I trust this indigenous-inspired spa keeps my best interests in mind	4.02	0.80
	I trust safety is guaranteed when making treatments at indigenous-inspired spas.	4.09	0.75
Attitude	I think the indigenous-inspired spa has the potential to create significant revenues and profits for the local people.	4.15	0.76
	I think therapy provided in the indigenous-inspired spas is only suitable for Aboriginal people.	3.58	1.20
	The Indigenous-inspired spa is attractive.	4.20	0.79
	The Indigenous-inspired spa is imposing.	4.19	0.79
	Visiting indigenous-inspired spas is an effort to support local culture conservation.	4.22	0.76
	Supporting the indigenous wellness industry is a morally right thing.	4.19	0.83

Table 2 showed the result of means scores and standard deviation analysis on the independent variable which are perceived cost, perceived benefits and perceived trust. The highest mean value for perceived cost was item 2, which was 4.09 (SD = 0.81) where the respondent believe that the indigenous-inspired spa provides affordable treatment costs. The lowest mean value for perceived cost was item 4, which was 3.58 (SD = 1.03) where the respondent slightly agreed the price offered at indigenous spas is more expensive than other spas.

Item 1 of perceived benefits has the highest mean value which was 4.08 (SD = 0.79). A total of 119 respondent strongly agree with that, where respondent believe receiving treatment in an indigenous-inspired spa can provide relief. Item 5 of perceived benefits has the lowest mean value which was 3.56 (SD = 1.18), where respondents slightly believe the indigenous-inspired spa does not have any wellness benefits.

Item 2 for perceived trust has the highest mean value, which was 4.10 (SD = 0.78). The majority of respondents strongly agree with item 2 which was 123 respondents where respondent believe the ingredients of indigenous-inspired spa products are safe and chemical-free. The lowest mean was item 4 which was 4.02 (SD = 0.80), where respondent trust this indigenous-inspired spa keeps my best interests in mind.

The highest mean value for the dependent variable; attitude was item 5, which was 4.22 (SD = 0.76). A total of 148 respondent strongly agree that visiting indigenous-inspired spas is an effort to support local culture conservation. Item 2 score the lowest mean value, which was 3.58 (SD = 1.20) where respondents slightly agreed that the therapy provided in the indigenous-inspired spa is only suitable for Aboriginal people.

Result of Reliability Analysis

Table 3 shows the result of reliability analysis of this research.

Table 26: Reliability Analysis Result

Variable	Number of items	Cronbach Alpha
Perceived cost	5	0.856
Perceived benefits	5	0.891
Perceived trust	5	0.922
Attitude	6	0.816

Table 3 showed the overall value of Cronbach's Alpha for the independent variables and dependent variable. From the table, the researcher can conclude all the variables were above the value of 0.7 and the highest variables were 0.922. Therefore, the result shown was reliable and it can be accepted in this research.

Result of Pearson Correlation Analysis

Table 4 below shows the result of correlation analysis of this research.

Table 27: Pearson Correlation Analysis Results

Hypothesis	P-Value	Result
H1: There is a significant relationship between perceived cost and attitude of spa-goers towards the indigenous-inspired spa.	0.000	H1 is accepted
H2: There is a significant relationship between perceived benefits and attitude of spa-goers towards indigenous-inspired spas.	0.000	H2 is accepted
H3: There is a significant relationship between perceived trust and attitude of spa-goers towards the indigenous-inspired spa.	0.000	H3 is accepted

DISCUSSION & RECOMMENDATIONS

This study builds a new avenue by highlighting the recommendations of proposals for potential research advances. This recommendation could provide a double benefit for new research on the perception and attitude of spa-goers towards indigenous-inspired spa.

The first recommendation is change existing data collection methods to the qualitative method. Qualitative research generates data differently that quantitative research seems not to. Interviews, observations, and document analysis are examples of qualitative data. The key supporters in validating the fieldwork conducted in the qualitative study are field notes and researcher diaries. Future researchers are recommended to use qualitative methods such as telephone surveys and face-to-face interviews in their research. Specifically, for face-to-face or telephone interviews, the question asked can reveal the respondent's attitude. As a result, it delivers more accurate, consistent, and useful data for the study in knowing the influence of spa-goers' perception on the attitude towards indigenous-inspired spa.

Furthermore, future researchers should collect data by expanding the study samples to include public employees, private employees, housewife, and teenagers among singles, then instead of focusing solely on university students. This is because the future study will be able to collect data from a larger group of people and areas to gather facts and evaluate them more thoroughly. The information gathered will also be more effective and precise in determining perception and attitude toward indigenous spa.

Future researchers can renew, improve, and reproduce the journal in the future. Researchers compared data from western countries using standard journals in this investigation. As a result,

cultural differences between western and eastern students. Residents in different countries, such as western countries, may have different perspectives and make different recommendations, resulting in a biased situation. Future researchers can search for journals in public libraries such as university libraries and refer to books related to aboriginal spa products and services to help improve reading resources. In addition, future researchers can search for journals on Google Scholar and my Athens about perception and attitude of spa-goers toward indigenous-inspired spa to gain more information.

CONCLUSION

The study's objectives are to identify the perceived cost, perceived benefits, perceived trust and the attitude of spa-goers towards indigenous-inspired spa therapy. The Statistical Package for the Social Sciences (SPSS) version 26 was used to analyses the data. The hypothesis of this study was developed using Pearson correlation analysis and descriptive analysis. The study's findings were provided in the previous chapter. The findings, limitations, and suggestions of this study will be discussed in this chapter. Recapitulation of data are based on chapter 4 which is based on the purpose of the study, research question, and hypothesis and those were used for this chapter. Those research question of this research require to prove the relationship between perception and attitude towards Indigenous-inspired Spa. All the three-research question that are used prove the relationship between perception and attitude towards the indigenous spa. From the results obtained, it is found that there is a significant relationship between the three independent variable which is perceived costs, perceived benefit, and perceived trust towards attitude of spa-goers towards indigenous spa therapy.

ABSTRACT

Spa and wellness facilities to exercise and receive various treatments to improve their health. A sauna and treatment rooms are included in the spa and wellness amenities. A sauna and a gym are among the spa and wellness amenities. Indigenous spas refer to goods and services produced by indigenous people according to their original concepts and traditions. However, indigenous spa products and services are not well received and acknowledgedby the community. Therefore, the purpose of this research was to study the impact of attitude on behaviour intention towards the indigenous spa and product services. In this research, affective attitude, behaviour attitude, and cognitive attitude serve as independent variables related to the dependent variable namely behaviour intention toward indigenous spas and services. A Google Form was used to disseminate a set of questionnaires to 358 people in the target population. SPSS was used to analyse the data from the questionnaire. The study's findings were substantial and corroborated the hypotheses. In conclusion, this study could be used as a resource for future research.

Keywords: Spa and Wellness, Indigenous Spa, Product and Services, Affective Attitude, Behaviour Attitude, Cognitive Attitude

INTRODUCTION

The spa first appeared in Asia in the mid-1990s, and the Asian spa industry has since grown from modest and tentative beginnings to become a phenomenon. This is because of the ability to draw on Asia's diverse cultural heritage and healing traditions (Micheal Loh, 2005). The spa is an acronym derived from the Roman Empire, which means 'Sanus Per Aquam (SPA) is 'health through water'.

An Indigenous spa is defined as an establishment offering healing body therapies incorporating elements derived in whole or part from Indigenous traditions, which are interpreted by clients to respect the origins. The indigenous spa concept has always aimed to honour the healing culture of the region in which it is located. The indigenous people have a wealth of information not only about medicinal plants, flowers, and herbs but also about living in harmony with nature as a whole.

This study was designed to investigate the affective attitude, behaviour attitude, cognitive attitude, and intention to visit the indigenous spa. There were three objectives of this research:
1. To identify the relationship between affective attitude and intention to visit indigenous spas.
2. To identify the relationship between behaviour, attitude, and intention to visit indigenous spas.
3. To identify the relationship between cognitive attitude and intention to visit indigenous spas.

Significance of the Study

This study was conducted to examine the uniqueness and privilege of indigenous spa products and services. Based on this research, the data will help them in reviewing the weaknesses and the best strategies for promoting their spas. As the result, indigenous people get the opportunity to compete on par with other spas. The data obtained from this research also can help to convince stakeholders such as the government, banks, and investors to provide incentives either in terms of financial capital or promotion of products and services produced by indigenous people.

In addition, it helps the community to be aware of the existence of goods and services produced by indigenous people, especially in the spa industry. The community's perception of indigenous people can be changed and further encourage them to support local products and services. In other words, it opens a new opportunity for future researchers to learn more about indigenous spas.

LITERATURE REVIEW

Affective Attitude

The affective component refers to a person's emotional reaction to the object of attitude. It involves a person's feelings or emotions about the object of attitude (McLeod, 2018). The affective part of the attitude refers to feelings about something. It is usually the first and may be positive or negative, such as fear-based reactions or pleasure-based reactions. It is important to separate the effects from cognition, where the effect is feeling, and cognition is what is thought. Deep-seated memories or experiences that shape feelings about things may cause affective responses (Chris Drew, 2020). While, Agarwal & Malhotra, (2005) describe that affective attitudes become stronger when individuals have more frequent and direct experiences with focus objects, people, or situations. The affective component involves the attribution of emotional mental states that can be attributed to intention.

Behaviour Attitude

The behavioural attitude of the term can be described as a means of self-control. It is a way to act or control yourself against others. It is a variety of actions, reactions, and manners set by individuals, systems, or organizations concerning themselves or their environment, under any particular circumstances. In summary, behaviour is an individual or group response to inputs such as actions, environments, or stimuli that can be internal or external, voluntary or voluntary, and conscious or subconscious. Behavioural attitudes are attitudes that develop as a result of certain behaviors. However, since a person's behavior does not always reflect his attitude, the attitude of a person does not always reflect his attitude towards certain behaviors (Angelova and Zeqiri 2011).

Cognitive Attitude

Cognitive attitude refers to the beliefs, knowledge, and thoughts possessed by the object of attitude. Sometimes, individual attitudes are also formed depending on the positive and negative traits associated with the object (Reber, 2001). Cognitive attitudes are defined as individual-specific beliefs related to a subject. These factors consist of evaluation, consideration, acceptance, and perception of value points supported by thought (Hee-dong et al., 2004). Flavian et al. (2006) asserted that the amount of trust depends on the extent to which the needs and wants of the customer are met. People with high levels of confidence tend to easily determine and predict positive outcomes, and believe that this case will continue in the future (Aydin et al., 2005).

Intention to Visit Indigenous Spa

The intention is an important factor that influences a customer's intention to revisit a tourist destination or repurchase products and services. According to Tiefenbacher, Day, and Walton (2000), travelers are more likely to return to tourist destinations due to three personal motivations. The concept of visiting intentions comes from behavioural intentions. Aziz et al., (2012) found that when people have a stronger intention to engage in behaviour, they are more likely to engage in such behaviours. Behavioural intent indicates returns or re-visits of visitors to a facility or service. Conceptualizing, measuring, and predicting behavioural intentions is an area of interest to service providers and researchers which has been considered one of the key indicators of service enterprise achievement (Rahman et al., 2018).

Research Hypothesis

The literature review highlighted the independent variables like affective attitude, behaviour attitude, and cognitive attitude on intention to visit the indigenous spa. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1   There is a significant relationship between affective attitude and intention to visit indigenous spas.

H2   There is a significant relationship between behaviour, attitude, and intention to visit indigenous spas.

H3   There is a significant relationship between cognitive attitude and intention to visit indigenous spas.

Research Framework

Figure 1 below shows the research framework used for this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

This study used the quantitative method that was related to using statistical or numerical data. The researcher distributed the questionnaires to the respondents to test the dependent variables and the independent variables.

348

Moreover, a set of questionnaires was distributed to randomly selected respondents, which is the community in Kelantan. The researcher divided the questionnaire into 4 sections which are Section A, B, C, and D. For Section A, the questionnaire requested information on the respondent's demographics. Section B is about customer characteristics of spas in Malaysia while sections C and D questions elaborated more on the dependent and independent variables which were affective attitude, behaviour attitude, cognitive attitude, and intention to visit an indigenous spa that aswas examined in the survey. This questionnaire used the format of multiple choices and 5-point Likert scales of agreement.

Data Collection

The data collection was conducted using an online survey. Google Forms was used to reduce the amount of paper used, as well as the amount of energy expended in manually calculating the data obtained from the cost of using paper, and also makes it easier for people to answer the questions. For example, respondents can answer this question via their phone or laptop and it also allows people to answer the question at home without having to leave the house.

Sampling

The sampling method used in this study was convenience sampling based on Krejcie and Morgan (1970) table. The saturation of the sample size will be reached when the scope of the research question is broader to have more quality results (Vasileiou, Barnett, Thorpe, & Young, 2018). The size of the sample was chosen from the table by Krejcie & Morgan, 1970, where the sample size of a given population can be determined. The total number of people that will be taken to answer this research is a total of 358 people.

Data Analysis

There were four types of data analysis used in this study, namely frequency analysis, descriptive analysis, reliability test analysis, and Pearson correlation analysis. The data obtained was analysed by using SPSS version 27.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Frequency Analysis Results

Characteristic	Frequency	Percentage
Gender		
Male	87	24.4
Female	271	75.7
Age		
17-22	96	26.8
23-27	250	69.8
28-33	5	1.4
34-40	7	2.0
Marital Status		
Married	26	7.3
Single	331	92.5
Divorce	1	0.3
Level of Education		

SPM	20	5.6
Diploma	44	12.3
Degree	292	81.6
Master	1	0.3
PhD	1	0.3
Race		
Malay	324	90.5
Chinese	6	1.7
Indian	19	5.3
Others	9	2.5
Occupation		
Employed	60	16.8
Unemployed	288	80.4
Business owner	10	2.8
Household Income		
Less than RM1000	287	80.2
RM1001-RM3000	54	15.1
RM3001-RM5000	10	2.8
RM5001-RM7000	3	0.8
RM7000 and above	4	1.1
Information sources about spa visited		
Internet	285	79.6
Spa	26	7.3
Flyers/Pamphlet	15	4.2
Television	8	2.2
Newspaper	3	0.8
Words of mouth	22	6.1
Number of times visited a spa in the past		
Never	101	28.2
1-3 times	217	60.6
4-6 times	29	8.1
7-10 times	3	0.8
More than 10	10	2.2
Spa treatment and services used		
Body massage	40	11.2
Sauna	28	7.8
Foot massage	25	7.0
Scrub	18	5.0
Face/head massage	76	21.2
Traditional and Complementary medicine	26	7.3
Missing	145	40.5
Reasons for visiting the spa		
Stress relief/relaxation	107	29.9
Physical health	21	5.9
Beauty services	44	12.3
Anti-aging treatment	5	1.4
Nosiness	2	0.6
Mental health improvement	1	0.3
Lost weight	5	1.4

Other reasons	4	1.1
Missing	169	47.2

The analysis of respondents according to gender shows that out of the 358 respondents, 87 respondents (24.3%) are male while 271 respondents (75.7%) are female. As a result, the authors can conclude that the female sex is more concerned with their health, skin, and appearance, as well as relaxing from any tension, than the male (Merriam, 2011).

The highest number of respondents come from 23-27 years old (69.8%) while respondents aged between 28-33 years old (1.4%) are the lowest. Respondents aged between 23-27 years were more likely to go to the spa compared to other age distributions. Female consumers in this range are more concerned with their health, skin, and appearance, and would like to de-stress their bodies from any stressful situations (Phongvivat & Panadis, 2011).

The distribution of respondents according to their marital status shows that most of them, 331 (92.5%) are single while the least respondent is divorced (1 0.3%). Most of the respondents who answered this study were single; this happened because they prioritize health and personal appearance. Many single consumers can spend time at a spa after work, school, or other activities. They have more free time from their jobs and businesses. Single consumers have a lot of time to reflect on their lives, health, skin, and appearance. However, when compared to married folks, they must care for their husband and children. As a result, this group of customers does not have a lot of time to visit a spa. However, among a group of married and divorced people who also frequent spas, there are few reactions (Phongvivat & Panadis, 2011).

The analysis of respondents in terms of the level of education shows that 292 (81.6%) of the respondents possess bachelor's degrees. This was followed by a Master's and .D.Ph.D. holders that were equal and the lowest. From 358 respondents, 1 (0.3%) is Master holder and 1 (0.3%) is PhD holder. This is because most of the respondents who answered this study were Degree students. After all, the researcher gave the survey via WhatsApp and the respondents who answered were also the same group, namely degree students.

The analysis of respondents' backgrounds according to their race revealed that most of the respondents were Malay. The result shows that 324 (90.5%) of the respondents were Muslims and followed by the least which is 6 (1.7%) of the respondents were Chinese. This is because Malay is more likely to answer this survey question because there are more Malay students in UMK than other races and the majority of the population in Kelantan is Malay.

In terms of occupation, 288 (80.4%) of the respondents are unemployed while 10 (2.8%) of them are business owners. Unemployed respondents answered this survey more because they are UMK students. Spas can help people relax and stay healthy so that they can function effectively at work and in life. As a result, a spa can provide relief to students who are apprehensive and stressed about their university assignments and examinations (Phongvivat & Panadis, 2011).

The analysis of respondents' backgrounds according to their household income revealed that most of the respondents receive less than RM1000. The result shows that 287 (80.2%) of the respondents gain income less than RM1000 while 3 (0.8%) of the respondents gain a household income of RM5001-RM7000.

The distribution of respondents in terms of information sources about spa visits shows the majority of 285 (79.6%) of the respondents get the information from the Internet. The lowest number of respondents getting the information sources from word of mouth was 3 (0.8%).

Getting information from the Internet is the best because most of those who answered this survey are students and they prefer to find information on the Internet because it is easier and saves time. Some media, such as newspapers and television, may have a low level of awareness among primary consumers since advertising costs are higher than those of the Internet, flyers or pamphlets, and other mediums (Phongvivat & Panadis, 2011).

The analysis of respondents according to the number of times they visited a spa in the past shows the highest is 1-3 times. Of 358 respondents, 217 (60.6%) visited a spa 1-3 times in the past. The lowest number of respondents who visited a spa in the past was 7-10 times 3 (0.8%). 1-3 times going to the spa is the most frequent choice because most of those who answered this survey are students and they do not have the time and money to go to the spa often.

The analysis of respondents according to spa treatment and services used shows that the highest is missing data 145 (40.5%). Apart from the missing data, the highest spa treatment and services chosen by the respondents was face or head massage 76 (21.2% and the lowest number of respondents getting spa treatment and services was scrub 18 (5.0%). Consumers are more worried about their skin and looks, as well as wanting to de-stress from any stressful situations (Phongvivat & Panadis, 2011).

Finally, the distribution of respondents in terms of reasons for visiting a spa shows the majority 169 (47.2%) of the respondents were missing data. Out of 358 respondents, 107 respondents (29.9%) chose stress relief or relaxation for visiting a spa and became the second highest selected after missing data. The lowest number of respondents going to the spa was for mental health improvement which was 1 (0.3%). Stress relief or relaxation is chosen because a spa can assist people in soothing and maintaining good health, allowing them to operate properly at work and in person (Phongvivat & Panadis, 2011).

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Cognitive attitude	I think the indigenous-inspired spa has the potential to create significant revenues and profits for the local people.	4.15	0.764
	I think therapy provided in the indigenous-inspired spas is only suitable for Aboriginal people.	3.57	1.200
	I think indigenous spas can grow into well-known spas across the country.	4.18	0.759
	I think the indigenous-inspired spa cannot be considered a luxurious and high-class spa	3.59	1.077
	I think an indigenous-inspired spa has the potential to promote aboriginal cultural engagement.	4.15	0.805
Affective attitude	The Indigenous-inspired spa is attractive.	4.19	0.784

	The Indigenous-inspired spa is imposing.	4.20	0.783
	The Indigenous-inspired spa excites me.	4.09	0.782
	The Indigenous-inspired spa is displeasing	3.39	1.251
	The indigenous-inspired spa is boring	3.27	1.275
Behaviour attitude	Visiting indigenous-inspired spas is an effort to support local culture conservation.	4.23	0.757
	Supporting the indigenous wellness industry is a morally right thing.	4.20	0.819
	I am reluctant to spend the money to get the services of indigenous spa treatments.	3.49	1.209
	Using the indigenous-inspired spa product is something good.	4.13	0.774
	Spending money to receive the services from an Indigenous-inspired spa will make me happy.	4.09	0.768
Intention towards indigenous-inspired spa	I would visit an indigenous-inspired spa in the future	4.15	0.781
	I would encourage people close to me to visit the indigenous-inspired spa.	4.14	0.759
	I do not intend to receive the treatment from an Indigenous-inspired spa	3.29	1.288
	I will never go to an Indigenous-inspired spa someday.	3.19	1.370
	I am interested to use indigenous spa products and services.	4.13	0.832

Table 2 shows the mean and the standard deviation for fifteen statements under three independent variables and five statements under the dependent variables based on the survey involving 358 respondents. The highest mean value for the cognitive attitude was obtained by Question 3 with 4.18, where the respondents agreed that I think indigenous spas can grow into well-known spas across the country. The lowest mean value belongs to Question 2 with 3.57, where the respondents agreed that I think therapy provided in the indigenous-inspired spas is only suitable for Aboriginal people. As for the affective attitude, the highest mean value was obtained by Question 2 with 4.2, where the respondents agreed that The Indigenous-inspired spa is imposing. The lowest mean value was belonging to Question 5 with 3.27, where the respondents were neutral that the indigenous-inspired spa is boring. Meanwhile, the highest mean value for behaviour attitude was obtained by Question 1 with 4.23, where the respondents agreed that visiting indigenous-inspired spas is an effort to support local culture conservation. The lowest mean value belongs to Question 5 with 4.09, where the respondents agreed that Spending money to receive the services from an Indigenous-inspired spa will make them happy. Next, the highest mean value for the dependent variable of intention toward indigenous-inspired spa was obtained by Question 1 with 4.15, where the respondents agreed that I would

visit an indigenous-inspired spa in the future. The lowest mean value belongs to Question 4 with 3.19, where the respondents' neutral that I will never go to an Indigenous-inspired spa someday.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis of this research.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Cognitive attitude	5	0.725
Affective attitude	5	0.614
Behaviour attitude	5	0.641
Intention to visit the indigenous spa	5	0.648

Table 3 shows the result of reliability coefficient alpha based on each independent variable and dependent variable. The first independent variable, cognitive attitude with 5 questions that show the Cronbach's Alpha value of 0.725 which range as acceptable in term of internal consistency, and the Likert-Scale question is considered more reliable.

The second independent variable, affective attitude within 5 questions is used to test the reliability and validity. The Cronbach's Alpha result is 0.614 which ranges as questionable so that the Likert-Scale question is considered as more reliable. The third independent variable, behaviour attitude within 5 questions is used to test the reliability and validity. The Cronbach's Alpha result is 0.641 which range as questionable in term of internal consistency and the coefficient that is obtained in the Likert-Scale question is considered as more reliable.

Lastly in measuring the dependent variable, 5 questions about the intention to visit an indigenous spa were used to test the reliability and validity. The Cronbach's Alpha result is 0.648 which ranges as questionable, and the Likert-Scale question is considered as more reliable.

Result of Pearson Correlation Analysis

Table 4 below shows the correlation analysis of this research.

Table 4: Pearson Correlation Analysis Result

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: There is a significant relationship between cognitive attitude and intention visit to the indigenous spa.	0.604	H1 is supported
H2: There is a significant relationship between affective attitude and intention visit to the indigenous spa.	0.724	H2 is supported

H3: There is a significant relationship between behaviour attitude and intention visit to the indigenous spa.	0.672	H3 is supported

The result has confirmed the theory of cognitive factors such as awareness can influence purchasing intention among consumers. Since people start to be concerned about health and beauty care, then it can trigger the intention to go to an indigenous spa to get the treatment. Besides, some consumers choose environmentally friendly products to save the environment and safer use (Amoako et al., 2020). In addition, cultured trends influence customer intentions towards a product. Cultural trends such as the Eid celebration can lead to drastic changes in consumers' attitudes and intentions in fashion trends and social networking trends. During Eid celebrations, almost all females desire to get spa treatment (Al-Hashimi & AlDhari, 2019). The study also confirmed that culture and religion can necessarily lead to buying intention (Awan, Siddiquei, & Haider, 2015). Especially for Muslims, who are concerned about the use of halal ingredients in a product. Therefore, natural, clean ingredients can influence Muslims' intention to visit the indigenous spa. Therefore, the hypothesis needs to be proved:

H1: There is a significant relationship between cognitive attitude and intention to visit an indigenous spa.

The consumers will measure the level of satisfaction, and create trust and loyalty to a product based on emotions. Consumers' intentions to visit indigenous spas are influenced by their awareness of love and concern for natural product usage. Due to emotional aspects involving love for green places and chemical-free products, most respondents agree to be loyal to visiting indigenous spas (Amoako et al., 2020). This especially happens among foreign tourists who love to experience natural environments such as indigenous therapies, and unique cultural experiences and are also interested in green local products. Moreover, the satisfaction product was able to create trust and influence the ultimate intention to revisit. Satisfied customers are more likely to spend more money on services and are able to influence the intentions of other customers by providing comments and suggestions (Zhao & Vajirakachorn, 2020).

H2: There is a significant relationship between affective attitude and intention to visit an indigenous spa.

The behaviour attitude includes feedback about the company, suggesting the service to other consumers, buying habits with the products, and expressing loyalty. Satisfied consumers at the spa are more likely to return, even if it means paying more for the same treatment. The study found that the quality of services has an impact on customer happiness, which leads to loyalty. Customer loyalty may help retain present customers while also attracting new ones. Besides, Átha Cliath, (2011) proves almost satisfied consumers will revisit spa services in the future. Similarly, Zhao et al., (2020) prove customers' behavior-able influence and encourage other person intention by creating loyalty, giving feedback and suggestions about the product. Therefore, the hypothesis needs to be proved:

H3: There is a significant relationship between behaviour, attitude, and intention to visit an indigenous spa.

DISCUSSION AND RECOMMENDATION

The discussion of the research is to determine the relationship between cognitive, affective, and behaviour attitudes that influence the intention to visit an indigenous spa among the community in Kelantan. The result shows that there is a significant relationship between cognitive attitude, affective attitude, and behaviour attitude toward the intention to visit the indigenous spa. Correspondingly, the previous research shows there is a connection between affective attitude, behaviour attitude, and cognitive attitude to visit the indigenous spa.

 In addition, the affective attitude has the strongest correlation compared to behaviour attitude and cognitive attitude based on the values of Pearson Correlation, which is followed by behaviour attitude and the least cognitive attitude, represented by the correlation (0.724>0.672>0.604).

The study puts forward a recommendation to change existing data collection methods to the qualitative method. Future researchers can not only use questionnaires to collect data, but they can also use the qualitative method where future studies can use telephone surveys and face-to-face interviews. Specifically, face-to-face interviews or by telephone can reveal the behavior of the respondents clearly through the questions asked. Therefore, it provides more honest, stable, and efficient information for research in finding out the impact of attitude on intention to visit indigenous spa products and services.

In addition, future researchers may be able to collect data by expanding the study area from all areas rather than just focusing on students. This is because future research can collect data more widely across all areas to gather facts and check them efficiently. The data collected will also be more accurate to find out the effect of attitudes on intentions to visit aboriginal spa products and services.

Then, future researchers can also reproduce the journal. For this study, it used a familiar journal by comparing the results from the West Country. Therefore, there may be some cultural differences between western and eastern students. Moreover, the population of different countries has different views and may lead to bias. To help increase reading resources, future researchers can search for journals in public libraries in addition to searching for journals on Google Scholar and my Athens to find more information from abroad about the impact of attitude on intention to visit indigenous spa products and services.

CONCLUSION

The major goal of this study was to see how perceptions affect visitors' intentions to use indigenous spas' goods and services. Affective attitudes, behaviour attitudes, cognitive attitudes (independent variables), and intention to visit indigenous spas are influencing factors (dependent variables) examined in the study. As stated, 358 sets of questionnaires were sent to 358 respondents in Kota Bharu, Kelantan, and all of them were valid. In addition, findings from the questionnaire survey are analysed using descriptive and inferential analysis. Statistical Package for the Social Sciences was used to analyse the data acquired from the questionnaire (SPSS).

ABSTRACT

Stress is one of the most common emotional health problems among university students. The worst effects of stress are body feelings of low energy, headaches, nervousness, and shaking. The objective of the study is to examine the relationships between sociodemographic and interpersonal relationships (family dynamics) with stress among undergraduate students. A cross-sectional study was conducted among 335 undergraduate students. The convenience sampling technique is used as a sampling method in this study. A set of questionnaires comprising the Depression, Anxiety and Stress Scale (DASS-21), and Asian Family Characteristic Scale (AFCS) was used to measure stress and interpersonal relationship (family dynamic), respectively. Data were analysed using descriptive analysis, reliability analysis, and Pearson Correlation analysis. The findings of the study showed that there was a strong negative correlation between interpersonal relationships (family dynamic) with stress (p=0.001), whereby, there was a strong negative correlation between interpersonal relationships with stress. This study could contribute to the body of knowledge regarding factors associated with stress among university students. Future research could benefit from large-scale nationwide longitudinal studies which include all possible factors related to students of stress.

Keywords: Stress, Sociodemographic, Interpersonal Relationship, and Family Dynamic

.

INTRODUCTION

Stress is a normal and emotional response to changes in one's life that occur because of events, situations, incidents, or experiences. People get stressed for numerous reasons and react in different ways. Reaction toward stress is based on how people perceive the situation. However, if stress interferes with daily routine, this stress is considered a problem. Stress problems are common among university students. This happens when students' needs exceed students' ability to cope. Stress can be caused by many things, including test and assignment deadlines, work, friendship, and relationship problems, financial problems, perfectionism, and university life balance.

Instead, stress is a result of the interaction between stressors and the students' perception and reaction to them. When students have a negative reaction to a stressful situation or when the stress level rises, their health, emotional condition, and academic performance can suffer (Ranjita Misra & Mckean, 2000). In keeping with this discovery, Waghachavare, Dhumale, Kadam, and Gore (2013) analysed a sizable sample of college students and found that healthy lifestyles and academic variables related to a certain level of stress. Bhat U et al. (2018) recently established that mental stress is common among university students, particularly engineering and art students, as well as those who live with their relatives.

There were two objectives of this research:
1. To determine the association between sociodemographic factors (namely, age, gender, and financial status) and stress among university students.
2. To determine the association between interpersonal relationships and stress among university students

Significance of the Study
Student
The findings of this study will benefit all students, which will increase awareness of serious health problems such as stress which is a big problem for a student. In addition, the studies can help develop stress program modules to prevent or reduce the number of statistical cases among public university students. However, this study will also help other researchers study stress problems among public university students in the future.

Society
This study can also benefit all society to add knowledge and give awareness to increasingly worrisome stress problems. It is because the total number rate people with stress problems are on the rise. Therefore, it can encourage society to the importance of mental health care and the benefits of undergoing treatment and counselling to ensure better mental health.

University
The study also benefits the university. The university can identify the total number of students suffering from stress disorders and know the causes that lead them to it. The university can also raise awareness among public university students about mental health and the value of both mental and physical well-being.

Future study
Future researchers could use this research to understand stress problems among university students. Moreover, this research can be used as a reference and guideline by other researchers, especially in primary health education. In addition, other researchers can use data for different populations and regions for this stress disorder. In the same way, it raises awareness and enhances a healthy quality of life, especially for university students. So that this information can be used to develop an intervention module or program to reduce stress among university students.

LITERATURE REVIEW
Definition of Stress
Stress can be defined as a feeling of emotional or physical tension. Stress can affect many people every day (Medline Plus, 2021). Stressors assist your body in modifying to new conditions. Stress can be advantageous in that it keeps us alert, motivated, and able to escape danger. If you have a difficult test upcoming, for demand, a stress response may help your body strive and stay open. On the other hand, stress becomes a concern when stressors persevere deprived of relief or times of relaxation.

During stress, it can affect our body's autonomic nervous system, controlling heart rate, breathing, vision changes, and others. When people have long-term stress, it can activate the stress response, which causes wear and tear on the body. It also causes physical symptoms such as aches and pains, chest pains, or a feeling like your heart is racing, among others. Next, stress's self-documented actions, behavioural coding, and physiological quantities can all be used to assess stress responses (Sarah E. Frazier & Sarah H. Parker, 2019).

Prevalence of Stress among University Students

The prevalence of stress among university students worldwide ranged from 35.7% to 59.70%. In developed countries, such as Italy, the prevalence of stress among university students was 59.70%. (Igor Portuguese, Fabio Peru, Maura Gillette, Marcelo Campagna, Alex Burford, 2020). As a result, monitoring and management of the population's mental health post-pandemic is an important concern. The purpose of this study is to examine current research and draw conclusions on the associated factor of stress among university students.

A previous study showed that the prevalence of stress among university students in developing countries, such as Korea was 35.7% (Kwang-Hi Park, Hyun-lye Kim, and Jae-he Kim, 2020). A total of 738 university students in years 2–4 in five four-year universities in South Korea were involved in the study to investigate the moderating impact of mindfulness on the influence of despair following the degree of existing pressure. In the moderated regression analyses, mindfulness had a moderating impact on the effect of pressure on despair in the simplest low-pressure groups.

Sociodemographic Factors

According to Shaikh et al. (2020), college students are subjected to all forms of instructional pressure wherein they constantly assume they want to do well on their exams and feel unsure about their future. The mindset of the students, particularly in Malaysia, also contributes to the ongoing pressures among university students, with most university students wanting to have a perfect Cumulative Grade Point Average (CGPA) of their grades taken into consideration to secure a higher process for the future. This kind of mindset will lead to emotional pressure, tension, or pressure that happens because of the needs of the college's existence, which is the reason for stress among university students.

Interpersonal Relationships (Family Dynamic)

The transition to college gives students numerous new challenges, together with expanded educational demands, family factors, interpersonal stress with roommates, and romantic relationships. Studies focused on students show that interpersonal conflicts and relationships with others increase the level of suffering and are a major stressor in student life. Interpersonal stress was associated with increased symptoms of depression and anxiety as well as increased levels of anger and hostility.

Interpersonal conflicts are one of the most prominent stressors in university life, as well as middle-aged adult life because romantic relationship issues are one of the most common reasons for seeking counselling. Both adults and middle-aged adults are exposed to considerable stress (T. Kato, 2018). Friends play a lot in the way you experience life. In its simplest form, friendship is nothing more than a company. In their richest and most complex expressions, they provide a sense of belonging (Wrench, Garrett & King, 2014), support, and psychological well-being. It offers a variety of psychosocial benefits and interaction opportunities, especially for first-year students traveling through the unfamiliar realms of college friendships. Understand how friendships contribute to the psychosocial and interactive experiences of Freshmen College students. The positive effects of peer support through institutional initiatives are well detailed and exceedingly lucrative in sensitive, behavioural, and reasoning exchanges among students (Boud, Cohen, & Sampson, 2001; Kift, Nelson, & Clarke, 2010).

Research Hypothesis

The hypotheses in the study were as stated below

H1　　　　There is a significant association between sociodemographic factors (age, gender, and marital status) and stress in university

H2　　　　There is a significant association between interpersonal relationships (family dynamic) and stress among university students.

Research Framework

Figure 1 below shows the research framework use for this study

Figure 1: Research Framework

METHODOLOGY

Research Design

The research design in this study will be a cross-sectional study, this study used a quantitative method via statistics using large-scale survey research to collect information by distributing a set of questionnaires through Google Forms. This study aimed to determine the psychological stress among university students. Researchers decided to select university students in Malaysia, but we will just specifically mention University Malaysia Kelantan students. Researchers focus on the student's area of the city campus for the target respondent to undergraduate student researchers all respondents are from the Faculty of Hospitality, Tourism, and Wellness (FHPK).

The research instruments in the study consist of four sections. Sections A, B, and C. The study will use the Likert-scale instrument in Sections B and C. The self-completed questionnaire is designed to collect data. Section A is concerned with the respondent's demographic profile, which focuses on the respondent's demographic data such as gender, course, age, marital status, and year. For sections B and C, the question will be collaborated with dependent and independent variables which factors associated with stress (i) sociodemographic, stress (ii), and interpersonal relationship factor (iii) used in this survey.

Data Collection

A set of questionnaires was used as research instruments in the study. The set of questionnaires consists of three sections, Sections A, B, and C. The study used the Likert-scale instrument in Sections B and C. The self-administered questionnaire is distributed to collect data. Section A is for the respondent's demographic profile, such as gender, age, and year of study. In sections B and C, Depression, Anxiety and Stress Scale (DASS-21) and Asian Family Characteristic

Scale (AFCS) measure stress and interpersonal relationship, respectively. This questionnaire was distributed to 335 respondents who participated in this study. The survey was conducted online, whereby, social media was used as a platform to share the Google form link such as WhatsApp, Instagram, Facebook, and Email of students from the FHPK faculty.

Sampling

The sampling method used in this study is the non - probability sampling technique because samples are not selected by random. Purposive sampling was used for this study.

$$S = \frac{x^2 Np(1-P)}{e^2(N-1) + x^2 p(1-p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as a proportion (0.05)
x 2 = chi-square of the degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

There were four types of data analysis used in this study, namely frequency analysis, descriptive analysis, reliability test, and Pearson correlation analysis. The data obtained was analysed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Frequency Analysis (n=335)

Characteristics	Frequency	Percentage
Gender		
Male	87	26.0
Female	248	74.0
Age		
19	10	3.0
20	16	4.8
21	52	15.5
22	47	14.0
23	175	52.2
24	27	8.1
25	7	2.1
26	1	0.3
Race		
Malay	268	80.0
Chinese	33	9.9
Indian	29	8.7
Others	5	1.5
Marital Status		
Single	323	96.4
Married	11	3.3
Divorced	1	0.3
Year		

Year 1	51	15.2
Year 2	65	19.4
Year 3	193	57.6
Year 4	26	7.8
Course		
SAS	190	56.7
SAP	87	26.0
SAH	58	17.3

A total of 335 respondents have been collected in this research. From Table 4.1, there were 248 (74 %) respondents who represented female, and 87 (26%) respondents who represented male. It shows the number of female respondents is higher compared with male respondents in this research. Table 1 shows the age of 335 respondents. Age is divided into 8 categories. There were 19 (10%) respondents who were below 19 years old. While most respondents are in the age range of 23 years old, which were 175 (52.2%) respondents. There were 52 (15.5%) respondents aged 21 years old. There were only 16 (4.8%) respondents aged 20 years old. Then, at age of 22 years old was 47 (14 %). Next, 24 years old and 25 years old just had 27 (8.1%) and 7 (2.1%). Lastly, only 1 (0.3%) respondent was reported the age 26 years old. Table 1 above showed the race of 335 respondents. For Chinese and Indian, there were 33 (9.9%) respondents and 29 (8.7%) respondents respectively. Most of the respondents were reported to be Malays, summing up to 268 (80%) respondents. Meanwhile, only 9 (1.5%) respondents are reported to be of other races instead of Malay, Chinese or Indian. Overall, respondents who divorced marital status were the minority, representing 1 (0.3%) respondent. On the other hand, the majority of the respondents were single, which made up 323 (96.4%) respondents. Married represented 11 (3.3%) respondents respectively. Table 4.1 also showed the year of the respondents. The lowest respondents in year 4 were 26 (7.8%). The highest number of respondents in year 3, represented 193 (57.6%) respondents. For respondents in year 1 and year 2, represented 51 (15.2%) and 65 (19.4%) respondents. Table 1 above shows the course of 335 respondents. For SAS, there were the higher respondents, typified 190 (56.7%) respondents. The lowest respondents were SAH, which represented 58 (17.3%) respondents. Last, in the course SAP, the respondents were 87 (17.3%).

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research

Table 2: Descriptive analysis

Variable	Items	Mean Score	Standard Deviation
Interpersonal Relationship (Family Dynamic)	We express our love through hugging and kissing.	2.9343	0.95893
	We usually control me.	2.9672	0.76729
	We often receive praises for each other.	2.8090	0.84726
	We are concerned about the problems of each family member.	2.9015	0.89535
	We respect our elders.	3.0507	0.81185
	Each family member fulfils his/her responsibilities.	2.9642	0.82906
Stress	I found it hard to wind down.	1.79	0.788
	I tended to overreact to situations.	1.95	0.795

1 felt that I was using a lot of nervous energy.	2.07	0.894
I found myself getting agitated.	2.09	0.905
I found it difficult to relax.	2.13	0.871
I was intolerant of anything that kept me from getting on with what I was doing.	2.21	0.909
I felt that I was rather touchy.	2.05	0.884

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis of this research.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Interpersonal Relationship (Family Dynamic)	6	0.798
Stress	7	0.895

Result of Pearson Correlation Analysis

Table 4 below shows the correlation analysis of this research

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: There is a significant association between sociodemographic factors (age, gender, and marital status) and stress at university.	-0.549	H1 is supported
H2: There is a significant association between interpersonal relationships (family dynamic) and stress among university students.	0.001	H2 is supported

Table 4 was indicating the relationship between stress and also relationship & family dynamics. Based on the result that was run in the SPSS analysis of data, the significance of the value for the relationship & family dynamic is below 0.05 and while the p is less than 0.05, that means we reject the null of the hypothesis and accept the alternative hypothesis. This proves that there is a significant relationship between interpersonal relationships (family dynamic) and also stress among undergraduate students. After that Pearson Correlation is -0.512 which shows a strong negative correlations relationship between stress and interpersonal relationships (family dynamic).

DISCUSSION AND RECOMMENDATION

This research discusses which is a factor associated with stress among university students and addresses the hypothesis of whether related or not. Based on the results, the results the analysis considered that there was a significant association between the sociodemographic and interpersonal relationships with stress among students. According to previous research, there is a link between stress and interpersonal relationships along with sociodemographic. The effectiveness of DASS21 has been demonstrated (Henry & Crawford, 2005) and high internal reliability has been found in a population of young people (Tully, Zajac & Venning, 2009).

Next, from the Pearson Coefficient values of the study for this research, consequently, all the factors score weak and moderate negative correlations for the strength of correlations, but according to the value of interpersonal relationship has possible strongest correlation with stress compared to another independent variable in this study which sociodemographic followed by this independent variable showed since (-0.512). The result of Pearson Correlation test shows that there is a significant relationship between stress and interpersonal relationship (family dynamic) among undergraduate students ($p = 0.001$). The findings that we have analysed, shows that there is a strong negative correlation coefficient of 0.001. This means that interpersonal relationships (family dynamic) can avoid leading to stress problems among students. With stronger relationships and our family support in mental health can recover the loved one is set up for success.

Recommendation for further research to a suggestion or proposal as to the best course of action, especially one put forward by an authoritative body. To collect data effectively, distributing the questionnaire physically or face to face is acceptable. This is significantly easier because the researcher can urge the respondents to spend their time filling out the questionnaire. In other ways, we can keep the forms short to ensure their target respondents can have enough time to answer the survey if they want to use the online google form. The bias can be introduced by creating a form that too looks long to your subject and it also can introduce the segments into the smaller sections and skip the logic. Time constraints can negatively impact our study for the research, and it can be reduced by acknowledging this impact by mentioning a need for future studies such as developing a longitudinal study to answer these research problems. Future research could benefit from large-scale nationwide longitudinal studies which include all possible factors related to students with depression. Although online study using technology has enabled many things unimaginable, the transition to online learning has not gone as smoothly. For both lecturers and students, dealing with the difficulties of online learning is so disappointing and stressful for university students (Lisa, 2020).

CONCLUSION

This research has finalized and discussed the necessary findings of factors associated with stress among undergraduate students. The research objectives have been accomplished, research questions have been answered and hypotheses have been confirmed and accepted in this study based on the analysis of a total of 335 usable questionnaires. The findings of the survey questionnaire have been analysed using descriptive, reliability, and correlations analysis. The data obtained from the questionnaire were evaluated by a software program using the Statistical Package for Social Science (SPSS). The result shows that they have a significant interpersonal relationship (family dynamic), a factor associated with stress among undergraduate students. It shows that interpersonal relationship (family dynamic) is in negative correlation of -0.512. The independent variables are significant with the main dependent variable being stress. Summary of the results based on data analysis. Therefore, all of the hypotheses (H1, H2) stated were accepted. In addition, the limitations and recommendations while conducting this research study also include those that can be used for further study.

ABSTRACT

Depression is an emotional health problem becoming more prevalent among youth, particularly among undergraduate students. The objective of the study is to examine the relationships between socio-demographic factors, quality of internet connections, and family characteristics with depression among undergraduate students. A cross sectional study was conducted among 327 of undergraduate students. A set of questionnaires comprising Depression, Anxiety and Stress Scale (DASS-21), Orman Internet Scale and Asian Family Characteristic Scale (AFCS) was used to measure depression, quality of internet connection and family characteristics, respectively. Data was analysed by using Pearson Correlation analysis to determine the relationship between variables. Findings of this study revealed that there were a significant association between quality of internet connection and family characteristics with depression among university students. Future research could benefit from large scale nationwide longitudinal studies which include all possible factors related to the student's depression.

Keyword: Depression, Mental health, Socio-demographics, Family Characteristics, Internet Connections

---

INTRODUCTION

Depression is a mood condition characterized by chronic sorrow and a loss of interest. Depression affects how a person feels, thinks, and acts, also can lead to several mental and physical difficulties. University students endure a variety of challenges, including independent living, academic stress, peer pressure, and family issues, all of which can lead to depression. Student debt, higher education fees, and the online learning method were all difficulties that contemporary students experienced, and they had to face them.

Significance of study

This research will contribute to the body of knowledge on understanding of the factors related with depression among university students. To increase knowledge and attitudes regarding depression that can aid in the management of difficulties associated with depressive illnesses. Future research will lead to the establishment of an intervention program for lowering depression among university students for future research.

This study consists of three objectives:

1. To determine the relationship between socio-demographic factors and depression among undergraduate university students in FHPK, UMK.

2. To identify the relationship between quality of internet connections and depression among undergraduate university students in FHPK, UMK.

3. To examine the relationship between family characteristics and depression among undergraduate university students in FHPK, UMK.

LITERATURE REVIEW

Depression

Depression is a major mental health concern around the world due to its high of prevalence, chronic nature, and the challenging of treatment and recovery. Depression can cause feelings like sadness, guilt, low self-esteem, not being happy, and being unhappy with what's going on around them. Depression is a common and serious medical condition that affects how we feel, what we think, and how we act. It is characterized by constant sadness and losing interest or pleasure in things that used to make you happy.

Depression is an emotional health problem that is getting worse among university students in Malaysia post Covid-19 pandemic. This is mostly happening with first-year students who have a lot of problems. This situation is to be worried because depressions in the biggest mental health that can cause health effects and psychological effects (Nor Asikhin Ishak, 2020). Socio-demographics

Socio-demographics is the study of how people in a certain group or population can be identified by a mix of social and demographic factors. Depressive disorders in Malaysian university students can also be caused by how old they are. There are differences between men and women in how common different mental health problems are. For example, females are more likely to have internalizing diseases like depression because they have more problems balancing their lives at home, at school, and online, which can lead to mental health problems. Marriage status can also be one of the biggest problems for university students in Malaysia. There are both good and bad things that can be said about how a woman's marital status affects her education. Malaysian university students are most worried about money problems, especially during the pandemic. Muhammad Ashraful Islam et al. (2018) reported that 63.4% of students come from low-income families, which makes them more likely to get depressive illnesses.

Quality of Internet Connection

Students can fall behind in school if they have a slow internet connection or cannot get online from home in rural areas. The quality of your internet connection can affect what you do online, your grades, your digital skills, how well you do your homework, and even your career goals. Students who live in rural areas or have low incomes are less likely to have high-speed internet at home. Students are less likely to go to university if they do not have high-speed internet at home. When university students don't have good internet connections, it can affect their mental health.

The emotional problems of Malaysian university students can be caused by poor internet connections. Internet connections are different in cities and in the country. In rural areas, the government can come up with ways to improve network connections and internet plans. The evidence showed that the rural and socioeconomically disadvantaged students are least likely to have broadband internet or WIFI access at home to study via online learning. Only 47% of university students who live in rural areas have high speed internet access at home compared

to 77% of those in suburban areas who have a good quality internet connection (Mohammed Faez, 2020).

Family Characteristics

Depression could reduce the quality of life and relationships with friends and family. Having family problems can make it harder for university students in Malaysia to do well in school and stay motivated, which can make them more likely to have depressive disorders. Depression was 1.63 times more likely to happen to college students who lived with their parents than to those who lived far away from their parents (Yunmiao Yu, 2015). Researchers found that having a history of mental illness in your family and having been through other traumatic events contributed to the higher rates of depression.

It is not good for students' academic performance if they experience conflict with family members that can lead to their emotional health problems. It was important to maintain harmony in their family members and also focus more on their mental health and less on their family problems that could be contributing to their disorder or making it worse (Alyssa, 2019). Previous studies reported that 75% of students have a depressive disorder in 75% because of changes in their family lifestyles so there is a risk for mental health problems among them. Relationships within our family can help give us a sense of worth and value so this is important for our family members to support each other and not create the conflicts that can cause family relationships to become fragile (Yunmiao Yu, 2015).

Research Hypotheses

In this study, the following were the two hypotheses:
  H1   There is a significant relationship between quality of internet connections and depression among university students
  H2   There is a significant relationship between the family characteristics and depression among university students.

Research Framework
The Figure 1 below shows the research framework use for this study.

Figure 1: Research Framework

METHODOLOGY
Research design

A cross-sectional study design was used as research design. A total of 327 university students were involved in this study.

Data Collections

A set of questionnaires consisted of four sections, Section A for socio-demographic characteristics, whereas Section B consisted of Depression, Anxiety and Stress Scale (DASS-21) which used to measure depression, the dependent variable of this study. Section C and Section D consisted of Orman Internet Scale and Asian Family Characteristic Scale (AFCS), were used to assess quality of internet connection and family characteristics, respectively. The set of questionnaires was distributed via Google Forms.

Sampling

The non probability sampling technique was the sampling method used in this study because the samples are not selected at random. This type of sample is easier and cheaper to access. Purposive sampling will be used for this study. This study collected 327 respondents.

Data Analysis

This study used a SPSS to analyze the data. Three types of data analyses were conducted in this study, descriptive analysis, reliability analysis, and Pearson correlation analysis. For descriptive analysis, continuous data was presented in the form of standard deviations and mean, meanwhile, for categorical data, data was presented in the form of frequency and percentage. For reliability analysis, Cronbach alpha value was used for reliability of questionnaire in 30 respondents during pilot study. This analysis is crucial to determine whether the questionnaire used in this study was reliable or not. The Pearson Correlation analysis was conducted to determine the significant association between dependent variable and independent variables.

FINDINGS
Result of Frequency Analysis

The result of socio-demographic characteristics of respondents from undergraduate students was presented in Table 1. Majority of respondents were female (80.4%), aged 23-26 years old (61.5%), and single (98.8%).

Table 1: Frequency Analysis (n=327)

Characteristics	Frequency (n)	Percentage (%)
Gender		
Male	64	19.6
Female	263	80.4
Age		
19 – 22	117	35.8
23 – 26	201	61.1
27 – 30	5	1.5
30 and above	4	1.2
Marital status		
Single	323	98.8
Married	4	1.2

	Education level		
	Degree	327	100

Result of Descriptive Analysis

The question which will dominate the first of ranked with the highest mean is D10 "I felt that I had nothing to look forward to" with 1.388. The second ranking goes for D17 "I felt I wasn't worth much as a person" (1.351) followed by the D21 "I felt that life was meaningless" with is in 1.162. After that the least range of mean in D5 with "I found it difficult to work up the initiative to do things" with (1.003). This questionnaire was focused in types of depression questionnaire because of DASS-21 questionnaire have consist of Depression, Anxiety, and Stress Scales but for our main research for this study, that we only focused the questionnaire that consists of our main topic for this research, which is Depression, and have 7 items for this dependent variable of the study.

For a questionnaire to measure the quality of internet connections, the highest value of the mean for this questionnaire is "It is necessary to provide wireless Internet in their residence area" with 3.767 followed by the rank 2 with is "Without technology and Internet I cannot study effectively at any of my residence area (3.764). Other than that, the most at least for this mean is "Do you have problems controlling your impulse to connect to the Internet? Mostly the range for this questionnaire is acceptable and suitable because the range of mean is in 3 of above.

For the family characteristics, the first rank with the highest mean represented by the question of "We are always willing to pitch in and help each other" is 3.058 and followed by "Our family sticks together no matter how difficult things get (3.055). After that, the rank 3 was represented for the last question of harmony questionnaire family characteristics which is "We often show the harmony in the family with a smile" which is in 2.929. Fourth ranked was represented in 2.923 with "We often discuss if there is a problem in the family". Lastly, the lowest rank for question FC9 is (2.639) for "We often spend time watching movies together". The results of descriptive analysis for the questionnaire is presented in Table 2.

Table 2: The Result of Descriptive Analysis

Variables	**Items**	**Mean Score**	**Standard Deviation**
Depression	I couldn't seem to experience any positive feeling at all	1.052	0.933
	I found it difficult to work up the initiative to do things	1.003	1.031
	I felt that I had nothing to look forward to	1.388	0.882
	I felt downhearted and blue	1.015	0.938
	I was unable to become enthusiastic about anything	1.039	1.063
	I felt I wasn't worth much as a person	1.351	0.950
	I felt that life was meaningless	1.162	0.910
Quality of Internet Connections	Do you have problems controlling your impulse to connect to Internet?	3.048	1.225
	Do you think you will feel bad and struggle if you have the poor connection lines at your area?	3.422	1.250

	Do you get much of your pleasure from being connected to the Internet?	3.574	1.182
	Do you find it hard to keep away from struggle with the internet access at home for several days at a time?	3.183	1.247
	If no internet access, how would you feel (depression, anxiety, and stress)?	3.082	1.299
	Using the Internet is not problem to me	3.583	1.181
	I have a limited access to connect my WIFI in my residence area	3.094	1.331
	Without technology and Internet, I cannot study effectively at my residence area	3.764	1.222
	It is necessary to provide wireless Internet in their residence area	3.767	1.167
	I feel very bored if I don't have internet access in my house	3.550	1.224
Family Characteristics (Domain Harmony)	We are always willing to pitch in and help each other	3.058	0.965
	Our family sticks together no matter how difficult things get	3.055	1.016
	We often discuss if there is a problem in the family	3.923	0.992
	We often spend time watching movies together	2.639	0.961
	We often show the harmony in the family with a smile	2.929	0.971

Result of Reliability Analysis

The result of the reliability analysis is shown in Table 3.

Table 3: Result of Reliability Analysis

Variable	Number of items	Cronbach's Alpha Value
Depression	7	0.926
Quality of Internet Connections	10	0.933
Family Characteristics	5	0.877

Cronbach's Alpha is found to be very good when the value is 0.9 which is regarded as strong consistency and the respondents who tend to choose higher scores, according to Walker et al., (2016). Depression is the dependent variable with the excellent good of Cronbach's alpha score of 0.926, meanwhile, the quality of internet connection that also has an excellent reliability score, 0.933. The last independent variable is family characteristics (harmony) which comprises 5 questions and a Cronbach's Alpha of 0.877, indicated as good internal consistency.

Result of Pearson Correlation Analysis

Table 4 shows the result of Pearson Correlation analysis. Based on Pearson Correlation Analysis, there was a significant relationship between quality of internet connections and depression (p=0.001). The strength of the association between quality internet connections and depression was weak.

For the second independent variable, the family characteristics, findings of this study showed that there was a significant relationship between family characteristic (harmony) with depression among undergraduate students (p=0.001).

Table 4: Result of Correlations Analysis

Independent Variables	Pearson Correlation	p-value	Confidence interval (Lower, upper)	Interpretation
Quality of Internet Connection	0.488	0.001	(0.403, 0.566)	Weak Positive Correlation
Family Characteristic (Harmony)	-0.187	0.001	(-0.309, -0.065)	Strong Negative Correlations

DISCUSSION AND RECOMMENDATION

This study is designed to determine the relationship between quality of internet connections and family characteristics with depression among undergraduate student in FHPK, University Malaysia Kelantan (UMK) post Covid-19 pandemic. The main finding of this study showed that there was a significant relationship between quality of internet connection with depression. The finding is corresponding to past research, whereby the level of depression among students in this study was significantly affected by the quality of internet connections that was used for online classes for educational study. Additionally, the level of depression was higher in students with a poor internet connection as compared to those with a good internet connection. Examples, depression was found in 64.94% in those with the poor of internet access and the poor of internet connection had obviously impacts on the mental health of students using online classes (Ghazi, 2020).

Following that, finding of this study also showed that there was significant association between family characteristics and depression among students. Our findings established convincing evidence that students are likewise experiencing interference of family conflicts that was negatively affect student life. Previous research revealed that having to stay at home with family members will contributed the different obstacles of characteristics family in every life. Findings suggest that more students are experiences higher in family conflict 39.2% than family harmony 50.4% because of non-conducive environment. In line with past research, family conflict inflicts more damage to the family aspect, rather than the vice versa. It will affect the academic of lifestyles for student using online learning, assignment, and others. Development of a good relationship with family members will show a good, harmony for our family and this will prevent depression among students (Wan Mohd Azam Wan Mohd Yunus S. K., 2021).

The recommendation of this research is to collect data effectively, distributes the questionnaire physically or face to face is acceptable. This is significantly easier because the researcher can persuade the respondents to spend their time to filling out the questionnaire. In other ways, we can keep the forms short to ensure their target of respondents can have enough time to answer

the survey if want to use the online google form. Next, time constrains can negatively impact our study for the research and it can be reduced by the acknowledge this impact by mentioning a need for future study such as develop the longitudinal study to answer this research problems. In addition, future research could benefit from large scale nationwide longitudinal studies which include all possible factors related to students of depression. Reduce the number of people who react for the desired demographic.

CONCLUSION

In conclusion, the findings of this study show the significant factors of depression among undergraduate student were quality of internet connection and family characteristics. These two significant factors is important to be targeted in development of depression intervention program in future study.

ABSTRACT

Anxiety is one of the most common mental health problems among university students. The objective of the study is to identify the relationships between sociodemographic, coping skills and family values with anxiety. A cross-sectional study was conducted among 335 undergraduate students. The convenience sampling method was used as sampling method. A set of online questionnaires consisted of three section, Section A for sociodemographic characteristics, Section B for coping skills, and Section C for family values. Data were analyzed using Pearson correlation analysis to investigate the association between variables. The findings of this study showed that coping skills and family values were significantly associated with anxiety. Useful findings of this study could contribute to the body of knowledge on factors of anxiety in university students and an early anxiety intervention for this target group is urgently needed.

Keywords: Anxiety, Mental health, Socio-demographics, Coping Skill, Family Values

INTRODUCTION

In many nations, poor mental health among university students has become a severe problem. Malaysia is one of the countries which is a leader in Asia-Pacific education. (Kotera et al,.2020). The attitude of students who are less sensitive about their mental health makes the government's effort to raise mental health awareness among students still difficult to achieve and a challenge nowadays. Mental health refers to our emotional, psychological, and social well-being, all of which have an impact on how we think, feel, and behave. In this stage of life mental health is very important because if someone had experience with this problem it will affect their thinking, mood, and behaviours. (Mental Health.gov.2020).

Anxiety is one of the mental health problems commonly found among university students. Anxiety can refer to the body's natural response to stress. It is a feeling of fear about the future. Nearly all people are scared and terrified of a situation that is not ordinary. This problem can occur in any age, gender and situation. It can induce distress syndromes like shivering, breathing problems, headaches, mental deterioration, anger, cardiac arrest, and a variety of other symptoms.

Significance of the Study

The findings of this study will benefit undergraduate students, which will increase awareness of serious health problems such as anxiety which is a big problem for a student. In addition, the studies can help the future researcher to develop anxiety program modules to prevent or reduce the prevalence of anxiety among public university students. Future researchers could use the findings of this research to understand anxiety problems among university students. Moreover, this research, it can be used as a reference and guideline by other researchers, especially in primary health education. In addition, other researchers can use data for different populations

and regions for this anxiety. In the same way, it raises awareness and enhances a healthy quality of life especially for university students.

Student

The findings of this study will benefit all students, which will increase awareness of serious health problems such as anxiety which is a big problem for a student. In addition, the studies can help develop anxiety program modules to prevent or reduce the number of statistical cases among public university students. However, this study will also help other researchers study anxiety problems among public university students in the future.

Society

This study can also benefit all society to add knowledge and give awareness to increasingly worrisome anxiety problems. It is because the total number of people with anxiety problems that are on the rise. Therefore, it can encourage society to the importance of mental health care and the benefits of undergoing treatment and counseling to ensure better mental health.

University

The study also benefits the university. The university can identify the total number of students suffering from anxiety disorders and know the causes that lead them to it. The university can also raise awareness among public university students about mental health and the value of both mental and physical well-being.

Future Study

Future researchers could use this research to understand anxiety problems among university students. Moreover, this research can be used as a reference and guideline by other researchers, especially in primary health education. In addition, other researchers can use data for different populations and regions for this anxiety disorder. In the same way, it raises awareness and enhances a healthy quality of life, especially for university students. So that this information can be used to develop an intervention module or program to reduce anxiety among university students.

LITERATURE REVIEW

Anxiety

Anxiety disorders are a type of mental health problem. If someone has an anxiety condition, they will experience fear in response to the circumstances. They also can experience physical symptoms of anxiety such as a racing heart or starting to sweat. Anxiety can be defined as an emotion that is expressed by tension feeling, a worried mind, and physical changes such as an increase in high blood pressure (American Psychological Association, 2022).

There are several types of anxiety disorders, for example, i) Generalized anxiety disorder (GAD), ii) panic disorder, iii) Phobias, and iv) Separation anxiety. Anxiety is known as one of the most emotional health problems, especially for university students. This anxiety problem will become even more worrying if it cannot be treated and prevented as soon as possible. The possible factors of anxiety are coping skills; and family issues. But there is a significant level of anxiety which is divided into several levels: low level, moderate level, and high level. But this classification level of anxiety can be determined through the symptoms and problems faced by the student. (Khoshaim, et al, 2020)

.

Sociodemographic

Sociodemographic can be referred to as a combination of social and demographic factors that will define a person in a group or in a population. In this study, the socio-demographics that were included in the data analysis were gender, age, education, religion, marital status, race, and ethnicity. One of the most important socio-demographic parameters influencing a study decision is age. People in the same age group or category usually have similar experiences, which influences their preferences. The lifestyles of married students and single students are a bit different, like responsibility as students and as a wife or husband, especially for married students that have children (Hishan et al, 2018).

Coping Skills

 The adopted coping techniques are attempts to avoid or decrease threat, harm, or loss, as well as the anxiety that comes with it. May help people adjust to stressful conditions daily, as well as their physical and mental health. Student coping strategies may be a risk or protective factor for psychological distress and psychological well-being. During the covid-19 pandemic, a study observed that the effect of the pandemic crisis on the mental health of undergraduates can be reduced or increased following the adopted coping strategies. (Adriana Rezende Lopez and Oscar Kenji Nihei,2021). There are two types of coping that have been stated which Adaptive coping and Maladaptive coping. There were weak positive correlations between stress and anxiety with one maladaptive coping (venting) and weak negative correlations between depression and stress with three adaptive coping systems (religion, utilizing emotional support, and using instrumental support) (acceptance, religion). (Adriana Rezende Lopez and Oscar Kenji Nihei, 2021).

All subscales of psychological well-being revealed substantial positive relationships (mild, moderate, or strong) with life satisfaction. The ratings of life satisfaction and psychological well-being showed substantial (weak or moderate) correlations: positive with four adaptive coping strategies (active coping, planning, positive reframing, acceptance); negative with three maladaptive coping strategies (substance use, behavioural disengagement, self-blame). (Adriana Rezende Lopez and Oscar Kenji Nihei, 2021).

Family Values

Some university students have a variety of family problems that cause them anxiety as they study. One of these issues is a family member's illness, such as that of a parent, which necessitates the student's proximity to the patient. (Nabila Y. AlKandari, 2020).

Students who had negative family relationships in childhood had higher levels of anxiety. Parents' bad connections can lead to more unfavourable interactions between parents and children. Negative parent-child connections, as well as divorce, are both detrimental to mother-child relationships. A divorce between parents can disrupt the health of students and also the behaviour problem because they think too much about their parents and cause them to worry that they will be separated from their mother or father. (Amy Morin and LCSW, 2021).

Research Hypothesis

Hypotheses of this study were:
The literature review highlighted that the independent variable was coping skill and family values. There this research planned

H1   There is a significant relationship between coping skills and anxiety among university students.

	H2	There is a significant relationship between family values and anxiety among university students.

Research Framework

Figure 1 below shows the research framework use for this study

Figure 5: Research Framework

METHODOLOGY

Research Design

This study used the quantitative method to gain data through questionnaire. The data for this experiment was collected using the cross-sectional design approach. A cross-sectional study entails collecting data from a population at a single point in time. It will be chosen based on a set of certain variables (Cherry, K, 2019).

Data Collection

A set of questionnaires consisted of 4 sections, section A to section D. Section A has 6 questions that are about sociodemographic like age, gender, race, marital status, year of study, and course of students. Section B to section D has 4 points Likert – Scale. Section B (Anxiety) has 21 items, Section C (Coping Skills) have 28 items and the last section D (Family Value) has 30 items. The questionnaire used in the research study is through an online survey using Google Form which was distributed to 335 undergraduate students at UMK Campus City. Google Form link distributed via WhatsApp, Instagram, and Telegram. This is because this method does not need a high cost compared to other methods and it is very easy to collect the data quickly.

Sampling

In this study, because the sample was not randomly selected, the researcher will use a non - probability sampling technique. Non -probability sampling involves non-random selection. It will be based on convenience or other criteria, it will allow researchers to easily collect all the data. In a non-probability sample, individuals are picked based on non-random criteria. The advantages of sampling are designed to assist researchers to extract more information about students from the data they collect.

$$s = \frac{x^2 Np(1-P)}{e^2(N-1) + x^2 p(1-p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as a proportion (0.05)
x 2 = chi-square of the degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

There were four types of data analysis used in this study, namely frequency analysis, descriptive analysis, reliability test, and Pearson correlation analysis. The data obtained were analyzed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Frequency Analysis (n=335)

Characteristics	Frequency	Percentage
Gender		
Male	95	28.3
Female	240	71.4
Age		
20-year-old	18	5.4
21-year-old	27	8.0
22-year-old	100	29.8
23-year-old	139	41.4
24-year-old	33	9.8
25-year-old	11	3.3
26-year-old	7	2.1
Race		
Malay	248	73.8
Chinese	26	7.7
Indian	29	8.6
Other	32	9.5
Marital Status		
Single	322	95.8
Married	12	3.6
Divorced	1	.3
Years		
Year 1	22	6.5
Year 2	90	26.8
Year 3	193	57.4
Year 4	30	8.9
Course		
SAS	136	40.5
SAP	122	36.3
SAH	77	22.9

This part it will explain the result of socsocio-demographicaracteristics of respondents from undergraduate students in the FHPK Programme, the total of the collected data was 335 respondents. From table 1 Majority gender that answered was Female students 240 respondents (71.4%) and 95 respondents (28.3%) had been represented as male. The majority of the students aged 23 years old had given a response of 139 (41.4%). There were 248 Malay respondents representing (73.8%). For the marital status, the majority of single students consist of 322 which shows 95.8% meanwhile for the educational years majority of year 3 students 193 respond that consisting of 57.4% of students. Lastly, 136 students from SAS had the higher respondents which were 136 students to 40.5%. All the 335 respondents were students under the FHPK which were SAS, SAP, and SAH students' programs that consisted of 100%.

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research

Table 2: Descriptive Analysis

Variable	Item	Mean	Standard Deviation
Anxiety	A2) I was aware of the dryness of my mouth	1.77	0.756
	A4) I experienced breathing difficulty (e.g. excessively rapid breathing, breathlessness in the absence of physical exertion)	1.67	0.714
	A7) I experienced trembling (e.g. in the hands)	1.70	0.720
	A9) I was worried about situations in which I might panic and make a fool of myself	1.71	0.753
	A15) I felt I was close to panic	1.72	0.768
	A19) I was aware of the action of my heart in the absence of physical exertion (e.g. sense of heart rate increase, heart missing a beat)	1.72	0.761
	A20) I felt scared without any good reason	1.72	0.729
Coping Skill	1) I've been turning to work or other activities to take my mind off things	2.90	0.756
	2) I've been doing something to think about it less, such as going to movies, watching TV, reading, daydreaming, sleeping, or shopping.	2.98	0.744
	3) I've been concentrating my efforts on doing something about the situation I'm in.	3.01	0.746
	4) I've been taking action to try to make the situation better.	3.03	0.771
	5) I've been saying to myself "this isn't real".	2.59	0.917

	6) I've been refusing to believe that it happened.	2.54	0.937
	7) I've been using alcohol or other drugs to make myself feel better.	1.00	0.000
	8) I've been using alcohol or other drugs to help me get through it.	1.00	0.000
	9) I've been getting emotional support from others.	2.89	0.851
	10) I've been getting comfort & understanding from someone	2.95	0.823
	11) I've been getting help & advice from other people.	3.02	0.785
	12) I've been trying to get advice or help from other people about 0.81 II what to do	2.97	0.847
	13) I've been giving up trying to deal with it.	2.61	0.988
	14) I've been giving up attempting to cope.	2.16	1,014
	15) I've been saying things to let my unpleasant feelings escape	2.88	0.825
	16) I've been expressing my negative feeling.	2.85	0.816
	17) I've been trying to see it in different light, to make it seem more I 0.75 0.52 III positives	2.99	0.756
	18) I've been looking for something good in what is happening	3.03	0.744
	19) I've been trying to come up with a strategy about what to do	3.04	0.769
	20) I've been thinking hard about what steps to take	3.05	0.755
	21) I've been making jokes about it	2.65	0.976
	22) I've been making fun of the situation.	2.41	1.059
	23) I've been accepting the reality of the fact that it has happened	2.68	0.962
	24) I've been learning to live with it	2.79	0.900
	25) I've been trying to find comfort in my religion or spiritual belief	3.10	0.783
	26) I've been praying or meditating	3.11	0.769
	27) I've been criticizing myself.	2.12	0.955
	28) I've been blaming myself for things that happened	2.16	0.969
Family Values	FP1 We exercise and carry out activities together	3.07	0.817
	FP2 We frequently visit our close relatives whenever we have the time	3.16	0.729
	FP3 We do the house chores together during weekends	3.16	0,762
	FP4 We usually watch movies with a family member	3.04	0.885

FP5 We usually discuss this whenever we have family problems	3.14	0.791
FP6 We smile because there is harmony in our family	3.18	0.728
FP7 We usually fight over small or trivial matters	1.73	0.854
FP8 We keep our own problems to ourselves	1.79	0.845
FP9 We keep our feeling to ourselves	1.79	0.855
FP10 My parents do not understand me	1.64	0.828
FP11 It is difficult for me to understand my family	1.62	0.806
FP12 My family usually controls me	1.62	0.814
FP13 We express our love through hugging and kissing	2.93	0.910
FP14 We usually help one another	3.16	0.793
FP15 We often receive praises for each other	3.13	0.760
FP16 We are concerned about the problems of each family member	3.17	0.708
FP17 We respect our elders	3.24	0.730
FP18 Each family member fulfils his/her responsibilities	3.14	0.791
FP19 My family members are usually self-centred or selfish	1.76	0.928
FP20 We solve problems on our own	1.82	0.915
FP21 Some of our family members are isolated or isolate themselves	1.71	0.867
FP22 Some of our family members are irresponsible and cause inconvenience to others	1.61	0.811
FP23 We often raise our voices when discussing	1.66	0.871
FP24Some of our family members retaliate when they are being reminded by another family member.	1.71	0.881
FP25 We are taught to be always truthful and punctual	3.13	0.760
FP26 We often engage ourselves in spiritual activities	3.26	0.684
FP27 We celebrate festive seasons (Hari Raya, Deepavali, Chinese, New Year, etc.) together	3.26	0.701
FP28 We often discuss religious matters together	3.17	0.718
FP29 We are taught to respect other religious and cultural belief	2.08	1.064
FP30 We always keep things tidy and organized	3.22	0.750

For this descriptive analysis, we used a categorical data concept so it will state about means and the standard deviation meanwhile for the continuous data will use frequency and percent. For the Anxiety question, a DASS-21 questionnaire consisted of 21 questions that contained stress, anxiety, and depression and only had 7 questions for every part. The first ranked dependent variable "I was aware of dryness of my mouth" has the higher mean that consists of 1.77 and the standard deviation of 0.76. Then it had been followed by three questions that have the same means of 1.72 but have a different sum of standard deviation which were "I felt I was close to panic were (0.768), 'I was aware of the action of my heart in the absence of physical exertion (e.g. sense of heart rate increase, heart missing a beat)"(0.761), I felt scared without any good reason(0.729). and for the last range was 1.67 and the standard deviation was 0.714.

Coping Skill question, which used the Brief-COPES questionnaire, the question of Coping Skill that contributes to anxiety was selected by all the respondents for this research. According to Table 2, the higher means for the coping skill was "I've been praying or meditating" which represented 3.11 for the mean meanwhile for standard deviation was 0.769. for the second highest was "I've been trying to find comfort in my religion or spiritual belief consisted of 3.10 and 0.783 from the questionnaire'. Lastly, the last statements were questions "I've been using alcohol or other drugs to make myself feel better, and I've been using alcohol or other drugs to help me get through it" that consisted of 1.000 and the standard was 0.

Table 2 had demonstrated the mean and standard deviation for the family characteristics. The first rank with the highest mean represented the question of "We respect our elders" with is 3.24 (0.730) and followed by "We often engage ourselves in spiritual activities and We celebrate festive seasons (Hari Raya, Deepavali, Chinese, New Year, etc.) together (3.26) consist to 0.769 and We often engage ourselves in spiritual activities that the means were same (3.62) means 0.701. After that, for rank 3 was represented for the We are concerned about the problems of each family member with is in 3.17. Lastly, as the lowest number of ranking questions, Some of our family members are irresponsible and cause inconvenience to others (1.61) to 0.811.

Result of Reliability Analysis
Table 4 below shows the reliability analysis of this research

Table 4: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Anxiety	7	0.927
Coping Skill	28	0.943
Family Values	30	0.885

A pilot study was conducted before actual data collection. A pilot test was conducted among 30 of respondents that need to be used to obtain the reliability of questionnaire. Table 2 shows Cronbach's Alpha for the questionnaire. Cronbach's Alpha value of 0.927, 0.943, 0.855 for anxiety coping skill and family values, respectively. Cronbach's Alpha value of 0.7 and above indicated good internal consistency.

Result of Pearson Correlation Analysis

The Table 5 below shows the correlation analysis of this research

Table 28: Pearson Correlation Analysis

Independent Variables	Pearson Correlation	p-value	Confidence interval (lower, upper)	Interpretation
Coping Skill	0.123	0.025	(0.007, 0.218)	Weak Positive Correlation
Family Values	-0.306	0.001	(-0.400, -0.205)	Moderate Negative Correlation

The table shows that the relationship between the two dependent variables which were coping skills and family values, and the independent variable anxiety were significant (p =0.001). However, the strength of association between coping skills and anxiety was a weak correlation, but there was a significant relationship. Whereas the relationship between family values and anxiety was a moderate negative correlation. The result of the Pearson correlation analysis is presented in Table 3.

DISCUSSION AND RECOMMENDATION

The objective of the research study was to determine the relationship between coping skills and family values with anxiety among undergraduate students in Faculty Hospitality Tourism and Wellness in Campus City. Based on the findings of the study, it was shown that there was a significant association between coping skills and family values with anxiety even if the association is a weak positive and moderate negative correlation. For the Coping Skill, even though the result was weak but it was a significant relationship with the Malay Brief-COPE that the sample was adequate being significant (p-value < 0.001). (Yusoff M.S.B., 2021).

For the recommendation for this research, it can use different styles of research design. In this research, we used a quantitative method that just shared the questionnaire by a link to WhatsApp so for the improvement questionnaire can be distributed face to face so the researcher can see the commitment from all the respondents and data can be collected effectively and does not take a long time to collect all the data. In addition, future research also could use a long-short study style because the researcher can see more details on the differences before the case is studied and after the completion of the study which may provide more knowledge, and the information collected will also be more detailed than that used in this research which uses cross-sectional study allocated a short period of time. Other than that future researchers also can further expand the study such as opening this study to lecturers as well as private universities, further researchers can also look more broadly at the way of life of students.

CONCLUSION

The purpose of this study is to determine factors associated with anxiety among undergraduate students in the FHPK students' course at University Malaysia Kelantan, Campus City. The independent variables we choose from this research are sociodemographic factors, coping skills, and family values. The research methodology employed in this study comprises a few

data, which are the researchers' method of collecting data in numerical data in groups, whereas, for candidates, a broader study was used and measured by questionnaire.

Factors Affecting Sleeping Patterns During Covid-19 Among Undergraduate Students in Universiti Malaysia Kelantan City Campus

Aisha Azman, Farah Afiqah Othman, Najmunhuda Zainudin, & *Mohammed Ruqaimi Remeli

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email: ruqaimi@umk.edu.my

ABSTRACT

Covid-19 spread around the world in December 2019 and started spreading in Malaysia around March 2020. As an implication, a lockdown or movement control order (MCO) has been implemented worldwide to control the disease. MCO has changed daily routine,, especially in sedentary behaviours, which means decreased physical activity, change in sleeping patterns, and increased use of screen gadgets. The research objectives of this study were to analyse the relationship between physical activity, smartphone usage and sleeping quality that affect sleeping during covid-19 among undergraduate students at Universiti Malaysia Kelantan City Campus. This research uses quantitative data to collect data from 294 respondents that consist of students in two faculties which are FHPK and FKP at UMK City Campus. Data was collected using a questionnaire and analysed by using SPSS version 26. To conclude, the results of the study were achieved and supported the variable of the study.

Keywords: Sleeping Pattern, Physical Activity, Smartphone Usage, Sleeping Quality

INTRODUCTION

The World Health Organization (WHO) has suggested social isolation and home quarantine to control the spread of the coronavirus disease (Covid-19). Therefore, a lockdown was implemented worldwide in March 2020, and Malaysia is one of the most afflicted countries.

The sleeping pattern of teenagers during the Movement Control Order (MCO) also changed due to their laziness and depending too often on social media. This is because teenagers stay at home too long due to MCO restrictions, so some may sleep too often and sleep less. Those who sleep too much may make their daily schedule boring; and choose to sleep for long periods. In the current study, participants delayed their wake time by 12 minutes, resulting in a 5-minute increase in total sleep per day, but no significant improvement in sleep quality was found.

A good night's sleep is widely recognized as a source of physical and mental health, happiness, and vigour. Individuals who do not get enough restorative sleep will be unable to perform, study, develop, or interact to their full potential at any given time. With the new life of studying, a university student's lifestyle transforms. Students' academic progress is greatly hampered by sleep issues and disorders.

The current study, according to Zhou, Wang, L. L., Yang, R., Yang, X. J., Zhang, Guo, Chen, J. C., Wang, J. Q & Chen (2020) revealed a high prevalence of sleep problems among adolescents and young adults during part of the covid-19 epidemic in China, especially among senior high school and college students, which were negatively associated with the level projection in covid-19 trends. They also discovered that social support could ease or minimise sleeplessness symptoms by reducing anxiety and depression symptoms; therefore, during the covid-19 outbreak, parents, school organisations, and other groups should provide some social

support to teenagers and young adults. These findings also indicate that the government should pay greater attention to sleep-related issues. These findings also imply that, in the fight against covid-19, the government should pay more attention to sleep difficulties among teenagers and young people.

This research consists of three objectives:
1. To analyse the relationship between physical activities and sleeping patterns during covid-19 among undergraduate students at Universiti Malaysia Kelantan City Campus
2. To identify the relationship between the usage of smartphones and sleeping patterns during covid-19 among undergraduate students at Universiti Malaysia Kelantan City Campus.
3. To determine the relationship between the quality of sleep and sleeping patterns during covid-19 among undergraduate students at Universiti Malaysia Kelantan City Campus.

Significance of Study
Researcher
This research can help some researchers to make decisions and gain statistics on sleep behaviour in students. Additionally, as the research is related to the covid-19 pandemic, some parties or professionals can analyse factors influencing sleep behaviour like smartphone use- and identify some comparisons related to sleep behaviour during home confinement due to covid-19 and before covid-19 arise.

Students and Parents
Students can also improve their knowledge about the importance of a healthy lifestyle, such as being an active student and increasing physical activity, whether on campus or at home. Based on the findings in this research, parents and guardians can be made aware of the sleeping pattern of their children; and their time on gadgets, including smartphones, tablets, laptops, and others.

Government and Society
In brief, this research will assist society in obtaining a healthy lifestyle, especially regarding the quality of sleep patterns and other health concerns like physical activity. Also, the concern with sleeping patterns by practising adequate sleep hours daily, eating healthy foods and having a balanced diet. Government and non-government organisations can collaborate to create campaigns or awareness to reduce sleep issues and achieve quality sleep patterns, especially during movement control order or home confinement. For example, public health campaigns about sleep hours, including health talk, advertisements, and short film, can be outlined by the Ministry of Communications Multimedia Malaysia and the production team for electronic devices such as television and, radio to increase awareness.

Entrepreneur
This research may create awareness for entrepreneurs to develop a business to improve the quality and duration of sleep, and to ensure that society can obtain a good sleep habits. For instance, a business promoting sleep items like a pillow with musical elements, an application for sleep schedule or pattern of a user.

LITERATURE REVIEW
Physical Activity
According to WHO (2020), physical activity refers to all movement, during leisure time, for transport to and from places, or as part of a person's work, either moderate or vigorous-

intensity physical activity. Physical activity is an important element in determining a human's life. This is important to reduce the risk of chronic diseases like coronary heart disease, kidney failure and others. According to WHO (2020), adults between 18 to 64 years old must be active in moderate physical activity at least 150 to 300 minutes a week or equal to 30 minutes per day. Meanwhile, for vigorous-intensity activity, a person should do at least 75 to 150 minutes weekly.

Banno, Harada, Taniguchi, Tobita, H. Tsujimoto, Y. Tsujimoto, Kataoka & Noda (2018) stated, several studies showing the positive effects of physical activity on sleep quality, and it is considered one of the non-pharmacological interventions to improve sleep quality. However, the investigation on physical activity level and sleep pattern are still ongoing, and there is no proper evidence on the effect of lesser physical activity due to the covid-19 situation can contribute to sleeping patterns (Diniz, Christofaro, Tebar, Cucato, Botero, Correia, Ritti, Lofrano & Prado, 2020).

Smartphone Usage

Smartphone users are predicted to reach 3.8 billion by 2020 and continue to rise at a rapid rate. Researchers investigate the effects of social distancing on social connectedness and happiness, as well as the moderating effect of smartphone use. Many people are unaware that smartphone addiction is serious and can severely impact on people's thoughts, behaviours, habits, emotions, and overall well-being (Alhassan, Alqadhib, Taha, Alahmari, Salam & Almutairi, 2018).

During the lockdown and home confinement, there is an increase in smartphone consumption which records 2 hours per day in smartphone use. This is evidenced in recent statistics that show adults spending more than the recommended daily hours on smartphone usage. It's worth noting that while increased digital media consumption before bed affects sleep latency and wake duration, it does not affect sleep quality. Furthermore, during the quarantine, people spend more time in front of screens, which has been linked to increased sleep difficulties in young adults (Sañudo et al., 2020).

Sleeping Quality

Sleep quality is obtained by getting enough sleep, an essential component of a good sleep pattern. According to Chaput, Dutil & Kanyinga (2018), sleep duration varies substantially during a human's life and has an inverse connection with age. Sleep length guidelines made by public health authorities are vital for surveillance and informing the public about interventions, policies, and healthy sleep behaviours. Individuals in home quarantine during the covid-19 crisis had significantly worse sleep quality than during the pre-quarantine period (Salehinejad, Azarkolah, Ghanavati & Nitsche, 2021).

The covid-19 pandemic-related lockdown appears to have altered several elements of students' unique lifestyles, particularly by boosting screen time, sleep duration and patterns. However, as Toscano, Arbinaga, Ozcorta, Salgado & Frutos (2020) stated in their research, women have the worst sleep quality than men, supported by the various indicators examined consistings of sleep patterns, sleep quality, other related subscales like subjective quality, latency, duration, efficiency, sleep disturbances, and diurnal dysfunctions as well as nightmare frequency and propensity.

Sleeping Pattern

According to the National Sleep Foundation's recommendations, short sleep duration is defined as less than 8 hours per night. The frequencies were dichotomised into binary variables (0 = short sleep duration, 1 = long sleep duration) via ways as follows.

As Franceschini et al. (2020) indicated in their study, that sleeping patterns have changed during the covid-19 pandemic especially during home confinement. This occurs because of changes in work schedules and the adaptation of everyone to cope with the new norm of covid-19 home confinement. This change includes time management as individuals must adapt to new changes like online learning methods and working from home. This may impact the quality of sleep and sleeping schedule as everyone stays at home all day.

An imbalanced sleeping pattern has a more significant effect on health particularly, physical and mental health. In terms of physical health, inadequate sleep is related to the risk of chronic disease. A Malek (2020) refers to a study conducted by the American Cancer Society about inadequate sleep, which stated that a person that sleeps less than 7 hours has a greater risk of developing coronary artery heart disease. In terms of mental health, sleep deprivation can negatively impact on the individual's attention and emotion. This happens because of a decline in the brain's function because sleep deprivation reduces blood flow and neural functions like working memory in a part of the brain (Silva & Sobral, 2021).

Research Hypothesis

Based on the literature discussed, the independent variables like physical activity, smartphone usage and sleeping quality are the factors that affect sleeping patterns during covid-19 among undergraduate students in University Malaysia Kelantan City Campus. Therefore, the hypotheses have been created and to be tested:

H1   There is a significant relationship between physical activities and sleeping patterns during covid-19 among undergraduate students at Universiti Malaysia Kelantan City Campus.
H2   There is a significant relationship between smartphone usage and sleeping patterns during covid-19 among undergraduate students at Universiti Malaysia Kelantan City Campus.
H3   There is a significant relationship between the quality of sleep and sleeping patterns during covid-19 among undergraduate students at Universiti Malaysia Kelantan City Campus.

Research Framework

Figure 1 below shows the research framework used for this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

This research uses quantitative as a primary tool to collect the numerical respondent's data, including questionnaires that consist of questions related to independent and dependent variables. This research used a non-experimental research design consistings of three designs: descriptive research (which includes observational research and survey research), correlational research and causal-comparative research. In this study, the descriptive research design was used.

The researchers utilised past surveys as a basis to create a questionnaire that was both reliable and functional for respondents to complete. Section A, Section B, Section C, Section D, and Section E were the questionnaire sections. The dependent variable had ten questions, whereas each independent variable included seven questions for physical activity, six in the smartphone usage section and eight in the sleep quality section. In part A, the demographic profile of the responder was examined, including gender, semester, race, religion, and some additional questions. All the items in sections B, C, D, and E were graded on a five-point scale: "1 = severely disagree," "2 = disagree," "3 = neutral," "4 = agree," and "5 = highly agree."

Data Collection

This study utilised the quantitative technique since it is more scientific, impartial, quick, focused, and acceptable. The researchers utilised Google Forms to distribute online questionnaires. The online questionnaire distribution was delivered via WhatsApp groups or Telegram and posted on a Google form link, and data was gathered from FHPK and FKP undergraduate students at the UMK City Campus. The survey was performed online due to the current covid-19 concerns in Malaysia.

Sampling

The researchers used snowball sampling as it was hard to find respondents from the two faculties. Therefore, by using this sampling technique, this study was able to increase the number of respondents to 33, who have been identified by Krejcie & Morgan (1970) in a shorter time.

For this study, the sample population consisted of the following group of respondents/participants from FHPK and FKP at the UMK City Campus. As the population of the two faculties (FHPK and FKP) students at the UMK City Campus was reaching 6,000, the researcher's sample size was 294.

$$s = \frac{x^2 Np(1-P)}{e^2(N-1) + x^2 p(1-p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as proportion (0.05)
x 2 = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

In this research, researchers use Statistical Package Social Sciences (SPSS) software version 26 for statistical data and analysing purposes. Four types of data analysis used in this study, were frequency analysis, descriptive analysis, reliability analysis and Pearson correlation analysis.

FINDINGS
Result of Frequency Analysis

Table 1 below shows the frequency analysis of this research.

Table 1: Demographic Analysis (n=294)

Characteristics	Frequency	Percentage
Gender		
Male	128	43.5
Female	166	56.5
Semester		
Semester 1	16	5.4
Semester 2	18	6.1
Semester 3	28	9.5
Semester 4	36	12.2
Semester 5	50	17.0
Semester 6	92	31.3
Semester 7	24	8.2
Semester 8	30	10.2
Race		
Malay	210	71.4
Chinese	45	15.3
Indian	34	11.6

Single	277	94.2	
Married	17	5.8	
Faculty			
FHPK	168	57.1	
FKP	126	42.9	

Result of Descriptive Analysis

Table 2 below shows the descriptive analysis of this research.

Table 2: Descriptive analysis

Variable	Items	Mean Score	Standard Deviation
Sleeping Pattern	1. It takes me 30 minutes or more to fall asleep.	3.80	1.233
	2. My work (Assignments) or other activities prevent me from getting at least 7 hours of sleep.	3.11	1.334
	3. It takes me 30 minutes or more to fall asleep.	2.71	1.458
	4. I am awake for 30 minutes or more during the night.	2.58	1.225
	5. I wake up 30 or more minutes before I must and can't fall back asleep.	1.70	1.044
	6. I am tired, fatigued, or sleepy during the day.	3.65	1.158
	7. I sleep better if I go to bed before 9 pm and wake up before 4:30 am.	1.51	0.987
	8. I sleep better if I go to bed late (after 1 am) and wake up late (after 9 am).	2.01	1.407
	9. I am prone to fall asleep at inappropriate times or places.	1.64	0.481
	10. I Snore	2.55	1.427
Physical Activities	1.During lockdown/MCO, how would you rate your vigorous physical activities like heavy lifting, digging, aerobics, or fast bicycling?	3.26	0.607
	2. How much time did you usually spend doing vigorous physical activities on one of those days? (Each number represents 30 minutes, e.g.,:1. Less than 30 minutes, 2. 30 minutes to 1 hour...)	3.15	1.476
	3. During lockdown/MCO, how would you rate your moderate physical activities like carrying light loads or others? Do not include walking.	3.15	1.476

	4. How much time did you usually spend doing moderate physical activities on one of those days? (Each number represents 30 minutes, e.g.,: 1. Less than 30 minutes, 2. 30 minutes to 1 hour...)	3.15	1.476
	5. During lockdown/MCO, how would you rate your walking pattern for at least 10 minutes at a time?	3.15	1.476
	6. How much time did you usually spend on that activity? (Each number represents 30 minutes, e.g.,: 1. Less than 30 minutes, 2. 30 minutes to 1 hour...)	3.15	1.476
	7. During lockdown/MCO, how much time did you spend sitting on a weekday? (Each number represents 1 to 2 hours, e.g.,: 1. One or less than 2 hours, 2. Two to 4 hours....)	3.15	1.476
Mobile Phone Usage	1. How long have you owned a mobile phone?	3.15	1.476
	2. How much time do you spend on your mobile phone daily?	3.15	1.476
	3. It is easy for me to spend all day not using my mobile phone.	3.22	1.390
	4. I don't pay attention to my mobile phone spending.	3.15	1.476
	5. I use my mobile phone in situations that would qualify as an emergency	3.15	1.476
	6. I borrow money from family or friends to pay my mobile phone bills.	3.15	1.476
Sleep Quality	1. During lockdown (MCO), when do you usually go to bed?	3.01	1.495
	2. During lockdown (MCO), how long (in minutes) does it usually take you to fall asleep each night?	3.15	1.476
	3. During lockdown / MCO, when have you usually get up in the morning?	3.15	1.476
	4. During lockdown (MCO), how would you rate the hours of actual sleep you get at night?	3.04	1.551
	5. During the lockdown (MCO), how would you rate your trouble sleeping?	3.15	1.476
	6. During Lockdown (MCO), how would you rate your overall sleep quality?	2.83	1.524
	7. During the lockdown (MCO), how often have you taken medicine	3.15	1.476

(prescribed or 'over the counter') to help you sleep?		
8. During lockdown (MCO), how often have you had trouble staying awake while driving, eating meals, or engaging in social activity? How would you rate it?	2.73	1.525

Table 3 shows the mean and standard deviation for 25 statements under three independent variables and ten statements under the dependent variable based on the survey involving 294 respondents. The highest mean value for optimism was obtained by question 1 with 3.26, where the respondents agreed that during lockdown/MCO, how would you rate your vigorous physical activities like heavy lifting, digging, aerobics, or fast bicycling? The other mean for another question was maintenance, which is 3.15. Next, the highest mean value for the second independent variable was obtained by question 3 with 3.22, where the respondents agreed to not spend all time with mobile phones. Others mean value for another five questions were maintained which is 3.1. Furthermore, the highest mean value for the last independent variable was obtained by four questions with the same mean value of 3.15. The lowest mean value belongs to question 8 with 2.73, where the respondents do not have any problem with their sleepiness during the day.

Result of Reliability Analysis

Table 3 below shows the reliability analysis of this research.

Table 3: Reliability Atalysis

Variable	Number of Items	Cronbach Alpha
Sleeping Pattern	10	0.209
Physical Activity	7	0.998
Smartphone Usage	6	0.999
Sleeping Quality	8	0.986

The Cronbach's Alpha scores for the questionnaire were in the range of poor level 0.20 to high level 0.999, as shown in Table 3. Cronbach's Alpha was used to assess three independent variables and one dependent variable. In the strength of correlation (10 questions: = 0.209), the first independent variable, sleeping pattern, was determined to be the lowest level in reliability analysis. The physical activity is then (7 questions with a score of 0.998). However, the correlation strength with smartphone usage was the weakest, with a high score in Cronbach Alpha (6 questions: = 0.999). Finally, sleeping quality has eight questions, with the score for Cronbach Alpha value being 0.986. Because the present Cronbach's Alpha value is already above the excellent threshold, the total variables have remained around 31 questions. As a result, the data were deemed appropriate for future investigation.

Result of Pearson Correlation Analysis

Table 4 below shows the corelation analysis of this research.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H1: There is a significant relationship between physical activities and sleeping patterns during covid-19 among undergraduate students at University Malaysia Kelantan City Campus.	0.205	H1 is supported
H2: There is a significant relationship between smartphone usage and sleeping patterns during covid-19 among undergraduate students at University Malaysia Kelantan City Campus.	0.225	H2 is supported
H3: There is a significant relationship between the quality of sleep and sleeping patterns during covid-19 among undergraduate students at University Malaysia Kelantan City Campus.	0.503	H3 is supported

The table shows that physical activity and sleeping patterns significantly correlated with r=0.205 p<0.01. Next, the p-value of H2 also shows a significant correlation between smartphone usage and sleeping pattern with r= o.225 p< 0.01. Similarly, there is also significant between sleeping quality and sleeping pattern with r=0.503 p<0.01. Therefore, the overall result is supported by the three hypotheses of the study.

DISCUSSION AND RECOMMENDATION

This study has analysed the factors affecting sleeping patterns during covid-19 among undergraduate students at University Malaysia Kelantan City Campus. In this section, there are several recommendations provided by researchers for improvement purposes in future studies.

Based on the findings, the suggested recommendation is the government can cooperate with non-government organisations to promote a healthy lifestyle by establishing an awareness campaign about healthy lifestyle, virtual run campaigns and other activities. This includes educating the public about good sleeping habits, an active lifestyle, and proper smartphone usage.

Next, it is also suggested that longitudinal studies be used in future research. This strategy is useful in research since it allows researchers to repeat the same investigations over a period. Based on Zuki. et al. (2021), the purpose of a longitudinal study is to see if there are any changes in the research over time.

It is suggested that future research seeks out additional populations and increases the sample size, such as from other universities in another state. As a result of this method, the study will become more precise as more data or information becomes accessible.

CONCLUSION

Finally, this research looked at the factors affecting sleeping patterns during covid-19 among undergraduate students at the Universiti Malaysia Kelantan City Campus. Physical activity, smartphone usage, and sleeping quality were chosen as independent variables to investigate the association between the dependent variables of students' responses. With a total of 294 respondents from semester one to semester eight undergraduate students, researchers were able to determined their sleeping patterns and how they affected covid-19. Overall, based on the finding of Pearson's correlation analysis, the sleeping pattern scored a value of *0.1, followed by physical activity with *-0.074, smartphone usage with *-0.071 and sleep quality with -0.039*. As a result, if pandemics affect the entire world, this research can give a conclusion or insight into the future, particularly for students.

Service Quality That Affects Customers Satisfaction at Spas in Kota Bharu, Kelantan

Nur Shafinas, Nur Solehah, Nur Diyanah, & *Muhammad Ruqaimi

Faculty of Hospitality Tourims and Wellness University Malaysia Kelantan

Coresponding email: ruqaimi@umk.edu.my

ABSTRACT

This study is aims to examine the service quality that affects customers satisfaction in Spas at Kota Bharu. A facility sampling approach was used, and 384 respondents were evaluated. The collected data is analysed using Statistical Packages for Social Science Version 26 (SPSS Version 26) software based on frequency analysis, descriptive statistics, reliability analysis, and correlation analysis. As a result, all independent variables (the relationship of tangible dimension in service quality, relationship between responsiveness dimension in service quality and relationship between empathy dimension in service quality) have a significant relationship to dependent variables (customers satisfaction) among customers who have experienced with service at Spas at Kota Bharu.

Keywords: Service quality, tangible, responsiveness, empathy, customers satisfaction.

INTRODUCTION

Tourism is one of the world's important and fastest-growing sectors and multi-sectorial activity that necessitates economic, social, cultural, and environmental inputs and produces employment both directly and indirectly through the expansion of linked industries. Wellness tourism is rapidly displacing all other types of tourism around the world and attracts high-end travellers from established and developing countries, boosting the economies of both developed and developing countries, as well as small or underdeveloped communities that are otherwise rich in traditional health and wellness approaches. The wellness concept is revolutionizing nearly every element of travel, and wellness tourism will only develop faster in the coming years, since it sits at the crossroads of two large, booming industries: the 2.6 trillion tourism sector and the 4.2 trillion wellness market (Global Web Index, 2018).

According to UNWTO (2013), international visitor arrivals surpassed one billion for the first time in history in 2012, with a 4% increase, or 39 million more tourists (Mosbah, 2014). In addition, people nowadays are looking for a place to relax and recharge themselves, owing to the hectic and nerve-racking nature of their working lives. Spas, according to the International Spas Association (2013), seek to be places of refuge, providing relaxation, treatments, pampering, and other services. It also acts as the one of the rapid industries in the world that has driven to massive challenges which need to be addressed. The reasons of emerging of wellness and spas industry are related to several factors. Right now, there are many countries accompanying heavily ageing population. In 2050 East and Southeast Asia countries will be an ageing of population and those in that countries will become more health aware and searching for a defensible lifestyle (East-West Center, 2011).

Spas and wellness services are growing and expanding remarkably in this region, including Malaysia. Consumer participation behaviour has become an essential part of these service-related business organizations, demanded by both locals and foreign consumers. Thus, understanding consumer participation behavior and customer value are essential. Although several studies have proposed the importance of consumer participation behavior, however,

understanding of how consumer participation behavior impacts attitudinal loyalty is still minimal. This study aims to analyze the critical dimensions of consumer participation behavior and its consequences.(Abdullah & Aziz, 2019).

Kelantan is a tourist attraction. Kelantan is the Since April 1, 1994, the Kelantan Tourist Information Centre, TIC has been given the responsible for transforming Kelantan into a famous tourist destination in the country (Suliadi, Zuhaimy and Marinah, 2013). Kota Bharu is the capital city of Kelantan, with a population of 2.001 million in 2018 (Department of Statistics Malaysia, 2020). Apart from being the administration centre for the state, Kota Bharu is also one of the top tourist cities in Malaysia. Kelantan was forecasted to receive 5.5 million tourists in 2020 (Kelantan Tourism Information Centre, 2020) before the pandemic hit. (Ramely et al., 2021).

The aim of the study is to analyses service quality that effects customers satisfaction in Spas at Kota Bharu,Kelantan. There are three objectives of this research:
1. To identify the relationship of tangible dimension in service quality with customers satisfaction at spas in Kota Bahru.
2. To determine the relationship between the responsiveness dimension in service quality with customers satisfaction at spas in Kota Bahru.
3. To examine the relationship between empathy dimension in service quality with customers satisfaction at spas in Kota Bahru.

Significance of Study
Researchers

This study helps researchers explore how the service quality dimensions can affect customer satisfaction among residents in Kota Bharu. In addition, this research will allow researchers to discover improvement measures to produce the best service to customers. It can also provide an opportunity for customers to voice their opinions on the services provided by the spas.

Customers

Future customers may benefit from the research topic as this research guides customers to know the benefit of going to the spa. In addition, they also know the reasons why they should choose the spas if they want to get the best service.

LITERATURE REVIEW
Tangible Dimension in Service Quality with Customers Satisfaction

There is already virtually little research into client experiences and emotions during consumption. Tangible facts that tangible can be understood from a cognitive and emotional standpoint are the key assumption in this research. A cognitive process can be triggered by an emotional response, and emotional and affective reactions can be triggered by thinking. Service interactions can elicit cognitive and emotional responses, establishing the foundation for service quality perceptions (Edvardsson, Bo, 2005). Furthermore, guests have a role as co-producers, carrying out activities and deeds and being part of interactions such as, front-line personnel, other customers, and technology that will impact or decide both process and outcome quality.

Responsiveness Dimension in Service Quality with Customers Satisfaction

Responsiveness is quality of the spas is closely related to the guests satisfaction to positively impact the clients' satisfaction and acquire the emotions of the spas experience it deserves. The long-term impact of emotions on customer satisfaction, service quality, and positive word-of-

mouth intention formation. A confirmatory factor analysis was used in the study to support a three-dimensional model of emotions, which then served as predictors in a series of multiple regressions. The findings show that, two emotion dimensions had a consistent direct impact on all dependent variables in both time period. In the other hand, the interaction effect between time periods and emotions, revealed that different emotion dimensions influence satisfaction and word-of-mouth intentions at various stages of the service encounter. The findings' theoretical and managerial implications are thoroughly discussed. Responsiveness well-being is an integral part of holistic wellness, as it can impact your outlook on life, your relationships, and how someone look at you (Lois Melkonia, 2021). This responsiveness plays its role and it is very important for a spas to be responsiveness so that customers can feel satisfaction with spas service, as this will encourage customers to find the same positive experience in the future.

Empathy Dimension in Service Quality with Customers Satisfaction

Empathy in a spas depends on one's sense of one's surroundings. If he feels sad the environment will also change his condition as a feeling will affect the surroundings. With empathy the ability to show this is recognized as very important as every customer who comes to the spas wants to improve the heart and clear the mind of existing problems (Ariana Odell, 2016). To deal with guests, one must understand empathy to make things easier. A study (Umasuthan Hamsanandini, 2016) stated that emotional empathy measures under empathy anxiety and emotional transmission. The results indicate that the empathy dimension strongly influences the hotel guest service experience. While the emotional service experience of business guests is almost entirely determined by cognitive empathy. According to previous literature and empirical findings in hospitality and tourism, empathy can be seen as a subscale in the SERVQUAL instrument. This paper focuses on the observation of the empathy dimension, and has revealed that the interaction of both the cognitive and emotional dimensions of empathy determines the overall emotional service experience and intentions of hotel guests.

Customers Satisfaction on Service Quality

The concept of customer satisfaction can be defined as a consumer fulfilment response where consumers experience contentment with the product or service they have purchased (Oliver, 2010). Furthermore, some researchers choose to focus on the complete consumer experience as the basis of customer satisfaction instead of only the fulfilment response after the purchase (Gerpott, Rams & Schindler, 2001; Hill, Roche & Allen, 2007). More specifically, the complete consumer experience includes factors such as quality, price, functions of the product, and personal benefits gained from the product (Gerpott et al., 2001). This is further supported by Harris and Goode (2004) as well as Parasuraman, Zeithaml and Berry (1994) who all argue that a consumer experience is a comprehensive satisfaction, that is more permanent, rather than only transactional based satisfaction. Where a transactional-based satisfaction can be explained as the satisfaction achieved from simply the transaction between the consumer and the company, and comprehensive satisfaction as the satisfaction achieved when all aspects of a consumer to business relationship are considered. This is because if the eight entire experience is positive, the consumers are more likely to repeat the process with that company over and over again (Hill et al., 2007).

Research Hypothesis

The hypotheses in the study are to find out whether there are any correlations or relations between dependent variables and independent variables:
  H1   There is a significant relationship between spas tangible service quality toward customer satisfaction

H2   There is a significant relationship between responsiveness on service quality that can affect customer emotion.

H3   There is a significant relationship between the empathy that can be produced to enhance good emotions to the guest.

Research Framework

Figure 1 below shows the research framework for this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

In the research design, there are two methods to ensure that the information collected allow researchers to focus effectively on research question which are quantitative and qualitative. According to Raimo (2021), quantitative research is concerned with numbers and figures, whereas qualitative research is concerned with words and their interpretations. Both are necessary for acquiring various types of information.

The differences between quantitative and qualitative in collecting and analysing data are that quantitative research is focus on testing theories and hypotheses while qualitative research is focuses on exploring ideas and formulating a theory or hypothesis. Next, quantitative more about numbers while qualitative is to words. For an example quantitative research are analysed through math and statistical analysis, mainly expressed in numbers, graphs and tables. While analysed by summarising, categorising and interpreting and mainly expressed in words are more to qualitative research. When it involves numbering, the question will be a closed questions which is multiple choice and it will requires many respondents because the key terms for quantitative research are testing, measurement, objectivity and reliability. Using open-ended questions and requires few respondents are for the qualitative research. The key term for qualitative are understanding, context, complexity and subjectivity.

This research uses a quantitative approach. Quantitative methods emphasize object measurements and the statistical, mathematical or numerical analysis of data collected through 18 polls, questionnaires and surveys or by manipulating pre-existing statistical data using computational techniques (Babbie, 2010). According to Bhandari (2021), quantitative research is the process of collecting and analysing numerical data. In this study, a survey was conducted through a questionnaire as the research instrument. The questionnaire was designed to collect all the information relevant to the objectives of this study.

Data Collection

There are several methods of data collection in the research study. This research was conducted using primary data. Primary data can be collected in many ways. The tool used in this research is a questionnaire through the Google form. A questionnaire is applied to collect the information regarding the relationship of tangible, responsiveness and empathy dimension in service quality with customer's satisfaction. The questionnaire was distributed online and data collected from the customer who received services at spas. This survey was conducted online because of the current pandemic in Malaysia, causing us to abide by the set rules. As a result, we know their answer.

Sampling

The sampling method is an introduction to the principles of sampling and considers, samples and populations, representativeness and random sampling sample. It concludes with a note on sampling for quantitative research. Sampling has implications for the way data are collected, analysed and interpreted. Quantitative methods allow you to test a hypothesis by systematically collecting and analysing data. Quantitative information is often called data, but can also be things other than numbers. Subjects in the population are sampled through a random process by using either a random number table or a random number generator therefore each person remaining in the population has the same probability of being selected for the sample.

There are two types of sampling method which are probability and non-probability. Probability sampling involves random selection and allows the researchers to make strong statistical inferences about the whole group. While non-probability sampling involves non-random selection based on convenience or other criteria. It may allow researchers to easily collect data (Shona, 2019). In this study, non- probability sampling will be used because it is mainly used in quantitative research. There are five main types of non-probability samples, but in this study, we used simple convenience sample.

A convenience sample is simply one where the units are selected for inclusion in the sample are the easiest to access (Laerd, 2012). The questionnaire form will be distributed to the respondents in Kota Bharu. Before letting the respondents answer the questionnaire, the researcher will ask whether the respondent have been to the spass in Kota Bharu or not. This will determine if they have experienced the service at spas in Kota Bharu.

Data Analysis

All the data collected will be checked in Statistical Packages for Social Science (SPSS). SPSS is a software for evaluating, modifying and generating characteristic pattern between different data variables. In addition, the output is obtained through graphical representation. So that, the user can understand the result easily (Jason, 2018). In this study, SPSS software was used to generate results from data collection through questionnaires distributed to respondents. Also, the data analysis is using the latest version of the Statistical Package for Social Science (SPSS).

The results will show that each data collected is reliable through the correlation between the independent and the dependent variables. If the result shown from SPSS is accurate, that is the correlation between the independent and the dependent variable, then the collected data is reliable and can be analysed.

FINDINGS

Result of Frequency Analysis

Table 4.2 below shows the frequency analysis of this research.

Table 29: Frequency Analysis

Characteristic	Population	Percentage
Gender		
Male	67	17.4
Female	317	82.6
Age		
18 – 20 Years	41	10.7
21 – 23 Years	150	39.1
24 – 26 Years	145	37.8
27 Years and above	48	12.5
Marital Status		
Single	210	54.7
Married	173	45.1
Other	1	0.3
Race		
Malay	321	83.6
Chinese	44	11.5
Indian	19	4.9
Monthly Income		
Less than RM1000	56	14.6
RM1001 – RM2000	117	30.5
RM2001 – RM3000	148	38.5
RM3001 – RM4000	59	15.4
RM4000 and above	4	1.0
How Often go to Spa		
Once a week	20	5.2
Once a month	28	7.3
Once every two months	198	51.6
Once every three months	138	35.9

The gender distribution of a total of 384 respondents. Table 1, shows that male respondents were 17.4 percent (n=67) less than female respondents' which is 82.6 percent (n=317). The reason is female respondents are more than male respondents is because female prefer to go to spas to relax than males.

Among these four age groups, the highest number of respondents were from 21 to 23 years, with 39.1 percent (n = 150). The second highest respondent age was from 24 to 26 years, 37.8 percent (n = 145) and followed by 12.5 percent (n = 48) respondents from the age 27 and above. While the lowest number of respondents were from 18 to 20 years old with 10.7 percent (n = 41). The reason the age of respondents from 21 to 23 years has the highest number is that they want to restores energy and calms the mind. Meanwhile, Respondent 18 to 20 have the lowest number of respondents because they are still in school and need to get permission from their parents.

The marital status distribution of a total of 384 respondents. It clearly shows that Single respondents were 54.7 percent (n=210) more than Married respondent 45.1percent (n=173). While other status is 0.3 percent (n=1). The reason Single respondents were more than Married respondents is because had more time to go to spa but married respondent did not have time

because they had to do housework. The Other status is less then both of status because they not interested to doing go to spas.

The race shows that, Malay respondents were 83.6 percent (n=321) more than Chinese respondents at 11.5 percent (n=44). For Indian respondents, it is 4.9 percentage (n=19). Malay respondents were more than Chinese and Indian respondents because Malays are more interested in going to the spas.

The Monthly Income distribution of a total of 384 respondents. It shows that RM2001 – RM3000 respondents were 38.5 percent (n=148) more than RM1001 – RM2000 and RM3001 – RM4000 which is 30.5 percent (n=117) and 15.4 percent (n=59). Monthly Income for Less than RM1000 is 14.6 percent (n=56) while RM4000 and above 1.0 (n=4). The reason RM2001 – RM3000 respondents were more than other Monthly Income that they have more time to go to spas and are not busy.

The Often go to a spa's distribution of a total of 384 respondents. It shows that respondents often go to the spa Once every two months were 51.6 percent (n=198) more than respondent go to the spa Once every three months were 35.9 (n=138) , while respondent go to the spa Once a month and Once a week were 7.3 percent (n=28) and 5.2 percent (n=20). Respondents often go to the spa once every two months because they have more time to relax they mind from work or study.

Result of Descriptive Analysis

Table XX below shows the descriptive analysis of this research

Table 30 Descriptive Analysis

Variable	Item	Mean Score	Standard Deviation
Tangible	Are you satisfied with the services provided by the spa?	4.89	0.381
	Is the shape of the spa building interesting to you?	4.87	0.408
	Does the cleanliness at the spa satisfy you?	4.86	0.407
	Does the spa provide up to date facilities?	4.84	0.425
	Does the spa have competent staff to ensure your satisfaction is guaranteed?	4.84	0.439
	Do the spa staff have high communication skills when serving you?	4.82	0.449
	Does the spa staff look is attractive to you?	4.82	0.445
	Do the facilities at the spa work well?	4.84	0.406
Responsiveness	Is staff responsiveness to customers satisfactory?	4.82	0.4473
	Are the spa staff caring and responsive to the client's needs?	4.82	0.4607
	Is staff responsiveness to customers satisfactory?	4.78	0.5453
	Are the spa staff caring and responsive to the client's needs?	4.80	0.4602
	Is the determinant of customer satisfaction determined by the responsive attitude of the spa staff?	4.79	0.4851

	As a spa client, do you think responsiveness is more important than knowledge and courtesy?	4.80	0.5138
	Responsive attitude reflects the willingness of spa staff to help clients?	4.78	0.4967
	Does a responsive attitude need to be inculcated in the staff of employees to gain customer satisfaction?	4.79	0.4781
Empathy	Does the Spa always keep you informed of new and attractive packages?	4.83	0.464
	Does the Spa always advise you to take the right product for your facial treatment?	4.83	0.439
	While getting services at the Spa, did you get personal attention?	4.82	0.468
	Is the service received from the Spa staff satisfactory?	4.80	0.471
	Are employees trained to understand customer feelings?	4.80	0.496
	The spa operate at convenient hours?	4.80	0.484
	The spa maintains strong customer relationships?	4.79	0.488
	Do you like all the employee behaviour?	4.80	0.516
Customers satisfaction	Are you satisfied with the service given to you by the spa staff?	4.85	0.399
	Are you satisfied with the cleanliness and environment of the spa?	4.84	0.421
	Are you satisfied with the facilities provided by the spa?	4.84	0.414
	Are you satisfied with the treatment given by the spa staff?	4.84	0.435
	Overall, have u satisfied with all service in that spa?	4.84	0.419

The frequency, mean and standard deviation for the items used to Measure Tangible in Service Quality. The higher questions measured for T1 (Are you satisfied with the services provided by the spa?) Mean is 4.89. There were two lower questions, which were T6 and T7 (Do the spa staff have high communication skills when serving you? and Does the spa staff look is attractive to you?) The mean is 4.82. The mean values T2, T3 T4, T5 and T8 are 4.87, 4.86 and 4.84.

The frequency, mean and standard deviation for the items used to measure the stage Responsiveness in Service Quality towards SD. There were eight questions measured with two questions having the highest mean R1 and R2 (Is staff responsiveness to customers satisfactory? And Are the spa staff caring and responsive to the client's needs?) 4.82 mean for the lower mean is R3 and R7 (Is staff responsiveness to customers satisfactory? And Responsive attitude reflects the willingness of spa staff to help clients?) With a 4.78 mean, continue with R4, R5, R6 and R8 with 4.80 and 4.79 mean.

The frequency, mean and standard deviation for the items used to Measure Empathy in Service Quality towards SD. There were one questions measured with the lowers means of 4.79 for question E7 (The spa maintains strong customer relationships?). The higher measure is question

E1 and E2 (Does the Spa always keep you informed of new and attractive packages? And Does the Spa always advise you to take the right product for your facial treatment?) With 4.83mean. Questions E3, E4, E5, E6, and E7 with 4.82 and 4.80 mean.

The frequency, mean and standard deviation for the items used to measure the Customer Satisfaction in Service Quality. There were five questions measured with the highest mean of 4.85 which is C1 (Are you satisfied with the service given to you by the spa staff?). Meanwhile, the same means 4.84 for questions C2, C3, C4 and C5

Result of Reliability Analysis

Table 3 below shows the results of the reliability analysis

Table 331 Reliability Analysis

Variable	Number of items	Cronbach Alpha
Tangible	8	0.933
Responsiveness	8	0.929
Empathy	8	0.934
Customer Satisfaction	5	0.905

Table 3 presents the Cronbach's Alpha values of the questionnaire in between the range of very good level 0.934 to excellent level 0.905. A total number of three independence variables and one dependent variable has been tested using Cronbach's Alpha. The first independent variable, which is Tangible in service quality found to be very good and reliable in the strength of Correlation (8 questions: $\alpha = 0.933$). Then, the Responsiveness in service quality (8 question: $\alpha = 0.929$) for Empathy in service quality was also found to be excellent in the strength of Correlation (8 question: $\alpha = 0.934$). Lastly, Customer Satisfaction in service quality is (5 question: $\alpha = 0.905$). The overall variables have remained with 29 questions as the current Cronbach's Alpha result is already above the good level. Therefore, the data were considered suitable for further analysis

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P. Value	Result (supported/ not supported
H1: There is a significant relationship between tangible in service quality and customers satisfaction	0.812	H1 is supported
H2: There is a significant relationship between responsiveness in service quality and customers satisfaction	0.742	H2 is supported
H3: There is a significant relationship between empathy in service quality and customers satisfaction	0.805	H3 is supported

Based on the table 4, Pearson's correlation analysis was used to test the relationship between hypotheses on a significant relationship such as tangible, responsiveness and empathy in service quality with customer satisfaction. Based on the result, all hypotheses were accepted at a 0.01 significant level.

DISCUSSION AND RECOMMENDATION

The purpose of the present study was to analyses service quality that effects customers satisfaction at spas in Kota Bharu, Kelantan. Service quality has been measured in a variety of social sectors such as economy-banks (Culiberg & Rojsek, 2010), hotel industry (Alexandris, Dimitriadis & Markata, 2002), restaurant business (Wall & Berry, 2007), health-hospitals (Murti, Deshpande & Srivastava, 2013) and many more. Nowadays, one of the most growing sectors worldwide is spa market and spa industry ('Spas Global Market Analysis', 2016). Spas centres are service organisations. This study focuses on three dimensions of service quality which are Tangible, Responsiveness and Empathy. Tangible refers to the spa's physical environment of the service, such as the appearance of physical facilities, equipment, towels-decoration-tools, spa location and appearance of the employees). In comparison, Responsiveness refers to the spa's staff or management's ability to provide promptness service. Lastly is Empathy, that refer to providing caring and individualised attention to spa customers. The last result of this study shows the relationship between hypotheses on a significant relationship such as tangible, responsiveness and empathy in service quality with customer satisfaction. All hypotheses were accepted at a 0.01 significance level.

Several recommendations can be made to increase customer satisfaction at the spa, including willingness to help the customers, provide food and beverages to customers and train employees to be honest and empathic treatment of customers. The first recommendation is the willingness to help customers. It refers to the attitude of an employees who is willing to help a customer without being asked. This can be realized in each employee through training or company policy. So, the management of those spas must create an environment of willingness to help the customers.

Second is provide food and beverages to customers. Spas are usually a place to get beauty and personal health treatments. Most spas in Malaysia, without the exception of spas in Kota Bharu, do not provide food and beverages for their customers. So, to further increase customer satisfaction, the spas management should provide a café for their customers. This café will be the place for customers wait and eat before getting the treatment. This not only will help increasing customer satisfaction but also can be increasing in spa's profits.

Lastly are train employees to be honest and giving empathic treatment of customers. This is said to be so because some employees do not perform

The Effect of Product Performance, Ease of Use and Social Influence on Customer's Intention towards using Delivery Service by foodpanda in Malaysia During Pandemic Covid-19

Wan Rosfaziera Wan Othman, Fatin Shazlin Zaidi, Mahirah Mohammad Norha, Izzah Alias & *Nur Hafizah Muhammad

ABSTRACT

The Malaysian food and beverage industry and food delivery services are gaining traction. Online food ordering is one of the new ways used since the COVID-19 pandemic. The changing nature of urban customers may have contributed to the growth of the online food delivery business. Despite the importance and changes in customer behaviour ordering food, this study identifies the effect of product performance, ease of use, and social influence on customers' intention to use foodpanda. Therefore. The objective of this study is to establish the relationship between product performance, ease of use and social influence of using food panda delivery service. For quantitative research, surveys in google form will be sent using social media such as Whatsapp, Telegram and so on among foodpanda users. The data in this study will be analyzed using non -probability sampling methods and well-chosen sampling. In addition, the SPSS method will be used to analyze the information collected.

Keywords: foodpanda, ease of use, social influence, product performance, intention, online food delivery

INTRODUCTION

This chapter consists of the background of the study, problem statement, research question, research objective, and the importance of the study, and it ends with the definition of terms. Each section will explain in more detail the importance of this study and explore the essence of the main objective to study customer intention with delivery services by food panda in Malaysia during the COVID-19 Pandemic.

Significance of The Study

Researcher

Future researchers will profit from this discovery. Future researchers will be able to learn about consumers' perceptions of online meal delivery services and the variables that can influence these perceptions. As a result, these findings may aid future research into these characteristics to fill in the gaps in customer and consumer mindsets. As a result, this research will aid future researchers in improving the quality of their work.

Industry

This study will aid the hospitality industry in developing new marketing strategies and maintaining market share. This is because the industry may face numerous challenges as it attempts to address customer unhappiness while improving its offerings. The industry might also investigate the impact of the quality of online meal delivery services on consumer happiness and loyalty. They will discover that customers' perceptions might change depending on the situation. Everyone has a different perspective on land, which impacts the buying rate. From the study, it would help the industry better understand consumers and improve customer needs and wants by making the right choice regarding online food delivery applications and their services.

Entrepreneurs

This study is helpful for those looking for an opportunity to invest in or start-up up online food delivery services. Entrepreneurs may also consider starting an online food delivery business when they can see a bigger chance of growth in the market. This is because this study's findings will provide preliminary data for the entrepreneur in terms of the main choices of consumers' intention and acceptance.

LITERATURE REVIEW

Intention to Use Online Food Delivery

Behavioural intention is the user can perform a particular activity or willing to pay for the system in the future (Brown & Venkatesh, 2017). The intention to buy is a subset of the intention to behave, and was used to predict consumer purchase behaviour. "It is thought that purpose encompasses the driving components that drive behaviour" (Ajzen, 1991; Mafe et al., 2010). The consumer's experience and intentions are intertwined (Alom et al., 2019; Olorunniwo et al., 2006). According to Ghajargar, Zenezini, and Montanaro (2016), the demand for home delivery services is increasing because of online purchases because these food delivery services cover a wide geographic area. Since this service is applied to the food and beverage industry, many individuals, particularly university students, are gradually adopting it. Online businesses such as online food ordering is already widespread, especially in fast-paced cities (Yeo et al., 2017).

According to the researchers, customers' choice to use online food delivery services is influenced by several factors (Cho, Bonn, & Li, 2019, Gunden et al., 2020). According to (Gunden et al., 2020), customers' intention to use online food delivery application to be strongly influenced by performance expectations and self-image appropriateness. Furthermore, system trust, convenience, design, and variety of food alternatives were revealed as significant indicators of customer desire to use online meal delivery (Cho, Bonn, & Li, 2019). Overall, the researchers found that if a person decides to purchase food and beverages through an online delivery platform such as food panda it is considered "to have the intention to use this application.

Product Performance

Product performance refers to how well a product operates in its working environment in response to public actions. The performance of its various components determines a product's performance. Product quality is defined as a feature of a product or service that influence the company's ability to meet stated or implied customer needs. (Kotler, 2019). Product quality was defined by Ahn, Ryu, and Han 2017 as the actual functionality of the goods and the consistency between the online shop's quality specifications and the actual quality of the physical product. As measurement items, the website employed product quality (the website offers high-quality products), product variety (the website sells a wide selection of products), and product availability (the website supports high product availability). Customers are more likely to visit an online store that provides a diverse selection of high-quality goods. (Handoko, 2020). Customers are more likely to return to an online store if the product and service quality meet their expectations. To summarise, product quality refers to the characteristics of a product that contribute to its ability to meet customers' needs.

Ease of Use

The term 'ease of use can be characterized as a system of use that will be effortless. When using e-commerce such as food panda application, users need to know that the application is user-friendly. foodpanda's popularity during the epidemic is due to its robust and user-friendly website and mobile app. (Suleiman, 2021). Empirical research has proven that the intention to use foodpanda as an online 24 delivery service is due to its convenient use. There are a few

aspects of ease of use, such as facilitating the user, self-efficacy in using the technology, and features that are easy to understand and secure.

Social Influence

An individual's impression of the importance of others in influencing them to utilise a new system is defined as social influence. Subjective norms, social circumstances, and image are all examples of social influence (Venkatesh et al., 2003). The perception that their important people think they should or should not conduct a given behaviour might set an individual's subjective standard (Vallerand et al., 1992). Even if they do not agree with the decision, an individual is somehow impelled to obey important people (Catherine et al., 2017). Family, friends, colleagues, or others that the individuals admire, as well as mass media such as Facebook, WhatsApp, and the internet, could be considered essential applications.

Research Hypothesis

The research hypothesis is made based on the factors which are performance expectations, perceived trust, and social influence that affect the acceptance of using online food delivery applications. Here are the hypothesis listed below:

H_1 There is a relationship between product performance and the intention to use foodpanda delivery service during COVID-19.

H_2 There is a relationship between ease of use and intention of using foodpanda delivery service during COVID-19.

H_3 There is a relationship between social influence and intention to use foodpanda delivery service during COVID-19.

Research Framework

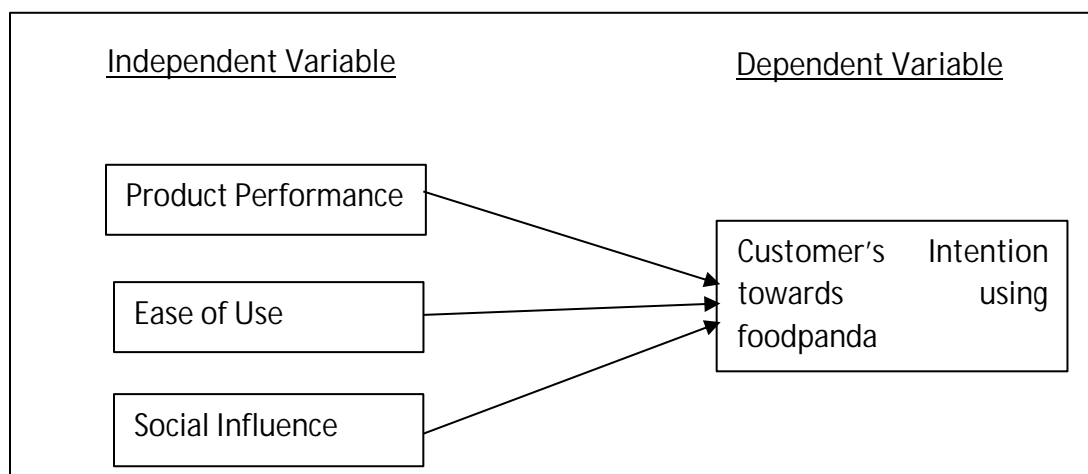
Figure 2.2 indicates this research's independent variables (IV) and dependent variable (DV). The figure shows the relationship between product performance, ease of use, social influences, and customer intention factors using the delivery service by foodpanda.


Figure 1Research Framework

METHODOLOGY

Research Design

This study used the quantitative method because the study's main goal is to obtain consumer intention of data using foodpanda. The target population of this research is the customers who intend to use online foodpanda delivery services and have access to the internet to facilitate their daily affairs. Researchers provide three sections in questionnaires which are A (demographic), B(IV) and C (DV) and using likert-scale types.

Data Collection

Data collection begins with determining the required data type, followed by selecting a sample from a specific demographic. Researchers must then collect data from the chosen sample using a specific instrument. Instead of conducting a survey, researchers can efficiently complete their research by using Google Forms. This tool lets them collect data by sending an email or distributing it to a list of respondents through Whatsapp. Also, it saves them time by allowing them to share the survey questions easily.

Sampling

This study employed a non-probability sampling technique known as convenience sampling. Convenience sampling is the practice of taking samples based on the availability of elements and the ease with which they can be obtained. This sample was chosen because it was in the right place and time. The advantage of convenience sampling is that this method is fast, easy and cheap. The researcher has the freedom to determine, select the sample and produce accurate data and uses this convenience sampling because the researcher can select respondents randomly. The questionnaire is designed using Google Forms and distributed across social media: WhatsApp, Facebook and Instagram. Researchers can get more respondents using the Google Forms method and social media.

Data Analysis

In this study, data analysis is explained with the four types of data refers to frequency analysis, descriptive analysis, reliability analysis and Pearson correlation analysis. SPSS version 26 will be used.

FINDINGS

Result of Frequency Analysis

Table 1Frequency Analysis

Characteristic	Frequency	Percentage
Gender		
Male	181	52.9
Female	203	47.1
Age		
18-25 years old	133	34.6
26-30 years old	96	25.0
31-35 years old	72	18.8
36-40 years old	43	11.2
41-46 years old	40	10.4
Race		
Malay	201	52.3
Chinese	81	21.1
Indian	64	16.7
Others	38	9.9
Type of Occupation		
Student	143	37.2
Employed	159	41.4
Unemployed	55	14.3
Retired	27	7.0
State		
Kelantan	38	9.4
Perak	22	5.7

Sabah	15	3.9
Sarawak	12	3.1
Wilayah Persekutuan (Labuan, Kuala Lumpur, Putrajaya)	34	8.9
Selangor	43	11.2
Kedah	32	8.3
Johor	37	9.6
Terengganu	38	9.4
Pahang	17	4.4
Perlis	12	3.1
Pulau Pinang	37	9.6
Negeri Sembilan	23	6.0
Melaka	28	7.3
Are you a foodpanda customer?		
Yes	382	98.5
No	2	5
Frequency of using foodpanda's application		
1-2 in a week	92	24
3-5 in a week	147	38.3
1-3 in a month	69	18
Rarely	76	19.8

The table above shows the frequency and percentage of the respondents' demographic. A total of 203 respondents are female, and the overall percentage of it is 52.9%. The total number of male respondents is 181, which carries a percentage of 47.1%.

The table above represents the ages of the respondents for this study. The ages have been classified into five classes. Out of 384 respondents, 133 (34.6%) are younger than 26 years old. The second biggest class, aged 26 to 30 holds about 96 (25%) of the frequency. The third biggest class is from 31 to 35, and get total of respondents is 43, with 11.2%, and for the last age class, which is from the age 41 to 46, there is a total of 40 (10.4%) respondents.

The ages have been classified into five classes. Out of 384 respondents, 133 (34.6%) are younger than 26 years old. The second biggest class, aged 26 to 30 holds about 96 (25%) of the frequency. The third biggest class is from 31 to 35, and get total of respondents is 43, with 11.2%, and for the last age class, which is from the age 41 to 46, there is a total of 40 (10.4%) respondents.

Out of 384 respondents, 201 (52.3%) of them are from Malay respondents, 81 (21.1%) from Chinese's respondent, 64 (16.7%) from India's respondent and the last other was (27 respondents). Out from 384 total of respondents, 57% of total respondents were Malay, followed by Chinese were 15.6%, Indian were 9.9%, and the remaining of 17.4% were other respondents by race who involved in this study. The total race of respondent has been classed into 4.

The highest percentage for occupation level of the respondents is employed which is 159 (41.4%). The second higher percentage is student who is 143 (37.2%) and the last unemployed with 55 (14.3%) respondents. Meanwhile, the retired represent the lowest percentage which consist of 27 (7.0%).

Next the frequency percentage for a domestic destination of the respondent. There are 15 states in Malaysia that were put into the option for the attributes of domestic destination.

The highest domestic destination is Selangor 43 (11.2%). Meanwhile, Johor and Pulau Pinang represented the same percentage and frequency of 37 (9.6%).

There is a significant difference between the percentage of foodpanda users. The percentage of foodpanda users is 382 (98.5%), and those who have never been foodpanda are 2 (5%).

Shows the frequency of using foodpanda's application. Frequency of using food pandas application is 3-5 in a week, with the highest number 147 (38.3%). Meanwhile, the 1-3 in a month represent the lowest number percentage 69 (18%). The second higher percentage is 1-2 in a week, consisting of 92 (24%) and the last rarely with 76 (19.8%).

Result Of Descriptive Analysis

Table 2 Descritive Analysis

Variable	Items	Mean Score	Standard Deviation
Product Performance	I am aware of the delivery policy/SOP of the food during pandemic	4.01	0.689
	The delivery charge is worth it for me	4.01	0.723
	Contactless delivery is a safe to prevent covid-19	3.98	0.749
	I prefer food delivery services compared to take away /cooking /dine-in	3.93	0.770
	When you contatcted to our customer service team, were all issues resolved to your complete satisfaction?	3.98	0.748
	How do you feel about the information that you receive from foodpanda application?	3.94	0.768
	I'm satisfied to purchase product by using foodpanda delivery application	3.96	0.862
Ease of Use	I believe I will make regular use of this system	4.00	0.765
	I thought the system is very complicated.	3.49	01.158
	I thought the system is simple to use.	4.02	0.658
	I believe I would need the assistance of technical person to operate this system.	3.55	1.377
	I thought the system's many functionalities is properly integrated.	4.04	1.163
	I think this system had too much inconsistency	3.45	1.387
	I believe that most individuals would soon learn how to use this.	4.00	1.121
	I felt quite comfortable utilising the system.	3.86	1.180
	Before I could get started with the system, I needed to learn technology things.	3.66	1.234
Social Influence	The social media like facebook influence me to use foodpanda	3.91	1.176
	The social media like Instagram influence me to use foodpanda	3.98	1.196
	Foodpanda advertisement in radio influence me to order food with foodpanda	3.95	1.222

	My friend suggested me to use foodpanda to order food	4.04	1.167
	My family always use food delivery application like foodpanda to order food at home.	3.94	1.214
	In the youtube website there are also foodpanda advertisement always pop up when watching any video.	3.94	1.232
	There are always foodpanda advertisement in the mailing website like google and yahoo	3.94	0.882
	My neighbour always orders food by using e-commerce application	3.92	0.961
	The foodpanda advertisement in whatsapp application influence me to order food online	3.91	0.729
Customer's Intention	I feel very confident using the food delivery service by foodpanda	4.02	0.771
	I think that using the food delivery service by foodpanda can attract the intention of buying more food	4.03	1.189
	People who influenced me to use food delivery services by foodpanda can attract my intention to use this application.	3.92	0.863
	If there is a chance, I will order food through the food delivery application by foodpanda	3.96	1.186
	I can order food with a wide range of prices through the food delivery application by foodpanda	4.60	0.500
	I intend to use foodpanda in the future to order food.	4.59	0.499

The table above shows the mean values for the independent variable, product performance, ease of use, social influence and the dependent variable customer's intention to use foodpanda. The highest mean value of 4.01 for both items, "I am aware of the delivery policy/SOP of the food during a pandemic" and "The delivery charge is worth it for me" strongly agreed as its level of agreement. Next would be that "Contactless delivery is safe to prevent covid-19" and "When you contacted to our customer service team, were all issues resolved to your complete satisfaction?" with the same mean value of 3.98, followed by "I'm satisfied to purchase the product by using foodpanda delivery application" with the mean value of 3.96 and "How do you feel about the information that you receive from foodpanda application?" with a mean value of 3.94 with the same level of agreement which is agreed. The lowest mean value is 3.93 for the statement "I prefer food delivery services compared to take away /cooking /dine-in" with the level of the agreement being agreed.

The average mean for performance expectation is 4.50, with strongly agree as the level of agreement. It shows that most respondents agree that product performance is important to customers' intention towards using the delivery service by foodpanda.

The statement "I thought the system's many functionalities are properly integrated" has the highest mean value with 4.04, and its level of agreement is 'strongly agree.' The second highest mean value is 4.02, with the statement "I thought the system is simple to use" with a level of agreement. Next would be 4.00 with "I believe I will make regular use of this system" and "I believe that most individuals would soon learn how to use this." One of these statements has 'agree' as their level of agreement, and another one is 'strongly agree'. The statements "I felt

quite comfortable utilising the system." and "Before I could get started with the system, I needed to learn technical things." have mean values of 3.86 and 3.66, respectively, with 'agree' as both their levels of agreement. The statements "I believe I would need the assistance of a technical person to operate this system." and "I thought the system is very complicated." are both in the 'strongly agree' level of agreement, with 3.55 and 3.49 as their respective mean values. The lowest mean value is 3.45, which "I think this system had too much inconsistency" with 'agree' as its level agreement.

The average mean value of the ease of use is 3.76, with 'strongly agree' as its level of agreement. This shows that most respondents agree that ease of use is essential to the customer's intention towards using the delivery service by foodpanda.

The highest mean value goes to the statement "My friend suggested me to use foodpanda to order food." with 4.04, its level of agreement is 'strongly agree.' The next highest is 3.98, 3.95 with the statement "The social media like Instagram influence me to use foodpanda" and "foodpanda advertisement in radio influence me to order food with foodpanda" with the same level of agreement, 'strongly agree'. The value of the mean of 3.94 have three following statements which are "My family always use food delivery application like foodpanda to order food at home.", "On the YouTube website, there is also foodpanda advertisements always pop up when watching any video." and "There is always foodpanda advertisement in the mailing website like google and yahoo." with the same level of agreement 'strongly agree'. The statement "My neighbour always orders food by using e-commerce application" has a mean value of 3.92 followed by "The foodpanda advertisement in WhatsApp application influence me to order food online" with a mean value of 3.91 and with strongly agree as both their levels of agreement.

The average mean for perceived trust is 3.94, with its level of an agreement being 'strongly agree.' This shows that the majority of respondents believe in the importance of social influence when it comes to the customer's intention to use delivery service by foodpanda.

The table above shows the mean values for the dependent variable, which is customers' intention toward using foodpanda delivery service. The highest mean value of 4.60 goes to the statement, "I can order food with a wide range of prices through the food delivery application by foodpanda." The second highest with a 4.59 mean value is "I intend to use foodpanda in the future to order food." followed by the statement "I think that using the food delivery service by foodpanda can attract the intention of buying more food.", "I feel very confident using the food delivery service by foodpanda.", and "If there is a chance, I will order food through the food delivery application by foodpanda." with the mean value of 4.03, 4.02 and 3.96. The lowest mean value is 3.92 for the statement, "People who influenced me to use food delivery services by foodpanda can attract my intention to use this application.' The level of agreement of all these statements is strongly agreed.

The average mean value for the dependent variable is 4.18 with its level of the agreement being 'strongly agree.' This shows that most respondents believe that product performance, ease of use and social influences are important aspects of customer's intention to use delivery service by foodpanda.

Result of Reliability Analysis

The table below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of Items	Croanbach's Alpha
Product Performance	7	0.850
Ease of Use	9	0.784
Social Influence	9	0.830
Customer's Intention using foodpanda	6	0.743

The table shows the reliability analysis results by Cronbach's Alpha for each independent and dependent variable. There are three independent variables, and the first is product performance. This variable had a total of 7 items, with a Cronbach's Alpha value of 0.850. This value also falls under the internal consistency of good $(0.9 > \alpha \geq 0.8)$. The second independent variable is the ease of use, with 9 items used to test its reliability and validity. The Cronbach's Alpha value for this variable is 0.784. This value falls under the internal consistency of acceptable $(0.8 > \alpha \geq 0.7)$. The third and last independent variable used in this study is social influence. This variable had 9 items under it, and Cronbach's Alpha value for it is 0.830. This value also falls under the internal consistency of good $(0.9 > \alpha \geq 0.8)$. The dependent variable, the Customer's intention towards using delivery service by food panda, had 7 items under it to question its reliability. The Cronbach's Alpha result for this variable is 0.743, which is considered acceptable in terms of internal consistency.

Result of Pearson Correlation Analysis

The Table 4 below shows The Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P Value	Result Supported Not Supported
H_1 There is a relationship between product performance and the intention to use foodpanda delivery service during COVID-19	0.706	$H_{1\ is}$ supported
H_2 There is a relationship between ease of use and intention of using foodpanda delivery service during COVID-19	0.834	H_2 is supported
H_3 There is a relationship between social influence and intention to use foodpanda delivery service during COVID-19.	0.826	H_3 is supported

Table 4 represent the Pearson Correlation analysis. Hypothesis 1 shows the supported result with a P value of 0.706, and hypothesis 2 and hypothesis 3 also show a positive impact with a P value of 0.834 and 0.826.

DISCUSSION AND RECOMMENDATION

The first recommendation is to maintain the use of the quantitative method rather than the qualitative method to collect data from respondents. This is because, for this research, the data was collected through online questionnaires. Therefore, this method will get through many respondents, as a total of 384 respondents of the required sample size with the data gathered. Meanwhile, the results would be more relevant, reliable, and generalizable to a larger population in Malaysia. The second recommendation is to find respondents that know the questionnaire. This could make the researchers get the correct data from the survey. This will

make it easier to collect data and increase the number of sample data. Thus, there will be more problems with a respondent who do not understand or know how to answer the questionnaire from this study.

Furthermore, the recommendation was the researcher can guide the respondent on how to answer the questionnaire. This is because some respondents do not know how to answer the online questionnaire. The respondent also suggested knowing our study very well, online food delivery services. Based on this research, this study is only focused on the independent variables: product performance, ease of use, and social influence on customers' intention to use the delivery service by foodpanda. Thus, all respondents can give more and better information.

The following recommendation is foodpanda can also send more riders to cover the rural part of the area because this area faces difficulties in going out to the town to enjoy the meals they want. Not only that, but since the distance is far away, I guarantee that the use of foodpanda will be rampant in the area. In addition, the system needs to be improved by further expanding the place to order food using the same rider. This will give more satisfaction to customer and being able to buy their desired food.

The last recommendation is, based on the results, suggests the online food delivery to get more information from the consumer. The independent variables that are product performance, ease of use and social influence attract customer the most to online food delivery services. For instance, product performance in this study measured the level of a product that would reach safely to consumers. At the same time, system facilities were felt responsible for measuring the level of consumers purchasing food using the foodpanda app. Lastly, social influence covers the degree how which an individual perceives the importance of an online delivery application and influence consumer toward the service. Hence, based on the data result, it can also be used as a prepared knowledge for consumers on online food delivery. So that online food delivery can be more observed to improve and increase the high customer's intention towards using the delivery service by foodpanda.

CONCLUSION
Finally,this research was performed to identify the relationship between the independent and dependent variables. Three independent variables are product performance, ease of use, and social influence and the dependent variable is customer's intention to use foodpanda. A total of 384 respondents from 18 years old and above were chosen from all states in Malaysia to accomplish this research.

ABSTRACT

Traditional Malay food is the cuisine of the ethnic of Malays in Southeast Asia who live in Malaysia. Traditional Malay food is characterised by its heavy use of spices. In this globalization era, most people from the generation Z in Malaysia prefer to eat fast food or 'modern snack' compared to traditional food. The young generation's food attitude nowadays has affected their choices. This is because Fast food and modern food products are in high demand since they are convenient for clients' busy lifestyles. Therefore, the study aimed to examine the effects of food knowledge, food attitude and food image on the acceptance of Generation- Z of Malay traditional food. 400 respondents who participated in this study which was conducted through the questionnaire. This study focused on Generation- Z that aged from 18 to 30 years old. The research design used in this study is quantitative research. The result showed that food knowledge, attitude and image play a significant role in generation- Z acceptance of the Malay traditional food.

 Keywords: Traditional Food, Generation Z, Food Knowledge, Food Attitude, Food Image.

INTRODUCTION

The hospitality sector comprises various disciplines within the service economy, including hotel, food and beverage service, event organizing, theme parks, travel, and tourism. Therefore, hotels, travel companies, restaurants, and pubs are part of it (Andrew, 2007). According to Brotherton (1999), hospitality is "a contemporaneous human transaction that is willingly entered into and aimed to increase the mutual well-being of the persons involved through the provision of shelter or food and drink."

The Malay ancestors contributed a diverse range of traditional foods to the Malay people in Malaysia, including ketupat palas, lemang, nasi lemak, and others. The Department of National Heritage Malaysia recognized these cuisines as Malay traditional foods (Department of National Heritage, Malaysia, 2019). Malay customs (for example, Malay traditional food and Malay language) were formed and widely diffused during the period by traders who travelled across Southeast Asia for business. As a result, traditional Malay food became well-known during the period. Furthermore, the advent of the Islamic faith among Malay communities in the 12th century established a distinct Malay custom and identity for the Malay people. Malay traditional food was intimately tied with Islamic teachings and life principles.

For quite some time, millennials and studies on new millennials have taken centre stage. The "millennial" generation is defined as youthful, educated, aggressive, and extroverted (Straussand Howe, 2003: Howe and Strauss, 2009). While the study on millennials continues, a new generation, "Generation Z," has begun to capture the interest of different stakeholders, including corporate executives, entrepreneurs, colleges, parents, and human resource practitioners. The characteristics of the Millennial generation differ from those of the previous generations. One of the millennial traits is the indicated above shift in consumer behaviour. They are more realistic, results-oriented, and selective. As the subject of our investigation, this study chose the millennial generation. The millennial generation clarifies to those born between 1980 and 2000 (Kotler and Armstrong, 2014). This study focuses on millennial generation Z

as the subject of research in the acceptance of traditional food among Generation Z. There were three objectives of this research:

      1. To determine the effects of food knowledge on Generation-Z's acceptance of Malay traditional food.

      2. To examine the effects of food attitude towards the acceptance of Generation- Z on Malay traditional food.

      3. To examine the effects of food image on the acceptance of Generation- Z of Malay traditional food.

Significance of the Study

Researcher

This research sought to provide clearer information and address the full existence of information to new researchers. This research also provided future studies with new resources, knowledge and the latest information on the factors that might affect traditional food acceptance by the young generation.

Gastronomy Tourism

Communities were particularly worried about the possible loss of both food and traditional food skills, especially among the young generation. (Almli et al.,2011; Bonanno, 2011; Kamaruddin, Zahari, Radzi, & Ahmat, 2010). Many commentators argue that if traditional food preparation methods are not passed down to future generations, countries may lose some of their traditional foods (Albayrak & Gunes, 2010; Bowen & Devine, 2011; Chenhall, 2011). There is an increasing erosion of culinary and cultural tradition due to a shortage of skilled practitioners of traditional food, especially senior generations, to pass on skills and knowledge to the younger generation..

Community

The study's findings will serve as a wake-up call for generation Z leaders and government agencies to develop practical guidelines for assisting Generation Z in preserving traditional food knowledge and practices. Secondary school teenagers and youth interested in the food business could be taught a module and curriculum in traditional food. This will provide an opportunity for future generations to explore and comprehend traditional food skills, thereby preserving ethnic food heritage in the long run.

LITERATURE REVIEW

Traditional Food

Traditional foods are passed down through the ages or consumed for many generations. Traditional meals and dishes are, by definition, traditional and may have a historical antecedent in a national dish, regional cuisine, or local cuisine. Traditional foods and beverages can be produced at home, at restaurants and small production facilities, or in large food processing plants. (Kristbergsson and Oliveira 2016).

Most traditional dishes result from housewives' abilities to combine their talents and ingredients to produce new recipes creatively and sensibly. If the recipe is well received, it will be worthy of replication. In other words, it has been widely reproduced and distributed to the point that it has become a classic recipe. As a result, the culinary history encompasses a diverse spectrum of traditional recipes intrinsically linked to a place of origin, unique resources, and different local practices. Classic recipes might fade into obscurity and vanish forever, but if they are widely consumed, they form part of a region's typical cuisine.A variety of factors has changed traditional foods over time.

Malay Traditional Food

Traditional Malay cuisine is the cuisine of the ethnic Malays in Southeast Asia, who live in Malaysia, . Traditional Malay food is characterised by its heavy use of spices. Coc coconut milk further enhances the rich, creamy flavour of Malay cuisine. The other ingredient is Belgian (prawn paste), which is used to produce sambal, a spicy sauce made from belacan, chilli peppers, onions, and garlic. In Malay cookery, lemongrass and galangal are commonly utilised (Alom et al., 2019; James, 2006). Rice is a common food in almost every Malay meal and a staple dish in many other cultures. A Malay lunch includes a variety of foods, however, they are all served at the same time, rather than in stages. Food is typically consumed with the right hand's fingers, never with the left, which is reserved for personal ablutions, and Malays rarely use utensils. Most authentic Malay foods are made from scratch, and traditional Malay cooking methods require few culinary instruments. Malay cuisine uses a variety of terms for cooking methods, which are classified into two categories: dry heat and moist heat. In addition to these two, there is a combination approach that uses dry and moist heat. 'Menu' (cooking paste, chile, or spices using oil or fat in the wok over reasonably high heat before adding to primary ingredients) is an example of Malay traditional terminology for dry heat methods (Mohd et al., 2017).

Food Knowledge

Traditional food knowledge is the cultural practice of handing down food-related skills, practises, and cultural beliefs from generation to generation.Traditional food knowledge may be used to establish a cultural identity, particularly for minority cultural groups; conveying this information can result in improved personal food security and nutrition abilities and increased communal capability. Additionally, this knowledge may be used to connect cultural diasporas and strengthen post-migration generations' cultural identities. As an intergenerational practise, traditional food knowledge transmission also contributes to socialisation. Traditional food knowledge may be lost within homes and communities when regional food systems and cultures evolve in response to global industrialisation, urbanisation, and cultural homogeneity forces. When traditional culinary knowledge is not handed on and reframed as a sphere of industrial production, particular expressions of flavour and place suffer a continuity gap (Kwik, 2008).

Traditional culinary knowledge must be conserved throughout upcoming generations since it will have significant spiritual and identification roles for individuals or groups. A few ethnicities have been reported to be losing their traditional culinary culture owing to older generations' failure to pass on traditional cooking expertise to younger generations and coping with deskilling difficulties linked to domestic cooking skills (Bowen & Devine, 2011; Stringer, 2009).

Food Attitude

Value Food attitude is a choice of foods by the generation Z is an area of concern for many people involved in the production and distribution of foods. It also relates to how individuals decide among available foods based on biological or economic considerations such as flavour, value, purity, ease or complexity of preparation, and the availability of fuel and other preparation equipment. Many factors influence the young generation's food attitude; for instance – access, knowledge, expertise, and availability are just a few examples. Culture, relatives, friends, and dietary routines are social factors. Emotion, tension, and guilt are examples of psychological factors. Food attitudes, beliefs, and knowledge

The way people buy food is changing, and the sales of ethical and sustainable products have increased. Eating food from outside the home is increasingly common. People nowadays also

prefer fast food and modern food as the reasons vary, and several policy levers may influence people's food choices. Taste preference, sensory qualities, cost, availability, convenience, cognitive restraint, and cultural familiarity are all factors that influence food attitude. Furthermore, environmental cues and higher portion sizes influence food selection and consumption (Wansink and Brian, 2004).

Food Image

Food image has caused the expression of all objective knowledge, prejudices, imagination and emotional thought of an individual or group such as generation Z in this globalization era. The variety types of food that offered in market nowadays has cause such a competition between traditional and modern food. The modern food seems to have an advantage in various reasons as it make the modern food have an expectation of familiarity with the products on the menu even at different places and branches. Modern food companies have long used the brand image to promote their products. There is an increase in marketing efforts focusing on entire product categories, such as ads encouraging daily consumption. A positive image raises consumer expectations, which may lead to a product purchase.

Consumers' expectations must be realised throughout product use to assure satisfaction and repurchase of the product. If buyers' expectations are not realised, there is a negative disconfirmation, and the product may never be purchased again. As a result, to be successful on the market, a product or product category must benefit from a strong general image and have product features that meet or exceed consumers' expectations (Valerie et al. l, 2010).

Food Acceptance

Food acceptance is a multi-dimensional process in which a person accepts or rejects food. Considering complex food matrices, it cannot determine correlations between individual physiological experience and individual behaviour. Consumers' reactions to food are impacted not just by the product's image and physiological characteristics but also by other factors such as prior knowledge of the product, marketing, accessibility, previous experience, and attitudes and beliefs. This paper looks at various methods to collect information on customer views, behaviours, perceptions, and intentions. Acceptance of food is essentially the result of a particular interaction between food and man. Consumer characteristics (genetic, age group, gender, physiological and psychological state) and those of the consumer's environment (family and cultural habits, religion, education, fashion, price or convenience) influence consumers' decision to accept or reject food. How much a person enjoys a food should be a significant element in determining food selection and consumption, i.e., eating habits. Few would disagree with this logical assumption (Meiselman and Bell, 2003).

Research Hypothesis

The literature review highlighted that the independent variables like food knowledge, food attitude and food image affect the acceptance of Malay traditional food among Generation- Z. Therefore, the study planned to examine the effect level among these variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

- **H₁** There is a relationship between food knowledge and the acceptance of traditional food among generation Z.
- **H₂** There is a significant relationship between food attitude and the acceptance of traditional food among generation Z.
- **H₃** There is a relationship between food image and the acceptance of traditional food among generation Z.

Research Framework

Figure 1 below shows the research framework used for this study

Figure 1: Research Framework

METHODOLOGY

Research Design

The research used a quantitative method to gain data through a questionnaire. The questionnaire was designed in English. There were three sections to the questionnaire: Section A, Section B, and Section C. Section A consists of demographic profile questions such as gender, age, race, education level and occupation. Sections B and C on independent variables and dependent variables included 5 items with five-point Likert-scale ranging from 1=strongly disagree to 5=strongly agree. The questions were adopted from previous studies (Vincent et al., (2017) by measuring the acceptance of traditional food among generation Z, including food knowledge, food attitude and food image. Therefore, the instrument is considered reliable. In this research, the researchers tested the relationship between knowledge, food attitude, food image (independent variables), and Generation Z traditional food acceptance (dependent variable).

Data Collection

The data collection was conducted using questionnaires. The questionnaires are distributed through the net or online survey. The information collected from the questionnaire was assigned to generation- Z, aged from 18 to 30 years old, through applications of WhatsApp and Telegram. This survey aims to get responses from generation Z on their acceptance of traditional food.

Sampling

The sampling method used in this study was non-probability sampling which was convenience sampling. The study used this method because questionnaires were prepared and distributed online or posted on social media pages to gather information from the respondents. The questionnaire was distributed to the respondents who are among the generation Z that ages from 18 to 30 years old, through online and social media.

Data Analysis

This study used three types of data analysis: descriptive analysis, reliability test and Pearson correlation analysis. The data obtained was analysed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1: Respondent Profile

Characteristic	Frequency	Percentage
Gender		
Male	181	45.3%
Female	219	54.8%
Age		
18-20 Years old	45	11.3%
21-23 Years old	278	69.5%
24-26 Years old	55	13.8%
27-30 Years old	22	5.5%
Race		
Malay	239	59.8%
Chinese	26	6.5%
Indian	61	15.3%
Bumiputera Sabah and Sarawak	74	18.5%
Education Level		
Secondary School	45	11.3%
STPM-Diploma	90	22.5%
Degree	259	64.8%
Master	5	1.3%
PHD	1	0.3%
Occupation		
Student	286	71.5%
Employed	85	21.3%
Self-employed	22	5.5%
Unemployed	7	1.8%

Based on the table, 219 respondents are women, accounting for 54.8% percent of the total, while male respondents account for 181 people, accounting for 45.3% percent of the total. Respondents between the ages of 21 to 23 years old have the highest number of study participants (278), accounting for 69.5% of all study participants, while those between the ages of 27 to 30 years old have the lowest number of study participants which is 22, accounting for 5.5 percent of all study participants. With 55 people, or 13.8 percent of responses, the age group of 24-26 years old had the second largest participants. There were 45 people, which is 11.3% of the respondents aged from 18 to 20 years old. Malay respondents had the greatest value of 239 respondents, or 59.8 percent, while Chinese had the lowest value of 26 respondents (6.5%). While Bumiputera Sabah and Sarawak had the second-highest number with a total of 74 respondents (18.5%), Indians came in third with 61 respondents (15.3%). The majority of

respondents in this study have a degree, with a total of 259 people, or 64.8%. In addition, STPM-Diploma recorded the second-highest value with 90 respondents (22.50%), Secondary School in third place with 45 respondents, leading to a value of 11.3%. In comparison, Master recorded the second-lowest value with 5 respondents (1.3%), and PhD was the lowest with only 1 respondent, equivalent to 0.3%. This study's majority are students, with a total of 286 people, or 71.5%. People who were employed recorded the second-highest value with 85 respondents (21.3%), self-employed in third place with 22 respondents, with 5.5%. Unemployed was the lowest position with only 7 respondents, or 1.8%.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Food Knowledge	My parents cook Malay traditional food at home.	4.03	1.107
	I help my parents when they cook Malay traditional food.	3.78	1.112
	My parents teach me how to cook Malay traditional food.	3.84	1.155
	My friends teach me how to cook Malay traditional food.	3.38	1.314
	I know how to cook any Malay traditional food.	3.58	1.137
	I always eat Malay traditional food during festival such as Hari Raya Aidilfitri and Hari Raya Aidiladha.	4.51	0.816
	Malay traditional food at is hard to cook and prepare.	3.28	1.231
	I was exposed to Malay traditional food since childhood.	4.23	0.987
Food Attitude	I like to eat Malay traditional food.	4.42	0.784
	I always eat Malay traditional food at restaurant.	3.57	1.148
	I always eat Malay traditional food at home.	3.82	1.162
	I always eat Malay traditional food with my friend at restaurant.	3.50	1.155
	I prefer to eat Malay traditional food because it is healthier.	3.59	1.079
	I think that Malay traditional food need a lot of time to cook.	3.62	1.048
	I think that Malay traditional food is hard to prepare.	3.36	1.151
Food Image	Malay traditional food is easy to find at my place.	4.31	0.830
	The raw material to cook Malay traditional food is easy to find at my place.	4.25	0.829
	Malay traditional food was highly promoted in social media and internet.	3.86	1.251

	Malay traditional food is cheaper than the other modern food such as fast food.	3.96	0.925
	I am more satisfied with the quick-service that offered in modern food restaurant than Malay traditional' food restaurant.	3.93	0.968
	I was satisfied with Malay traditional food taste.	4.16	0.838
	Malay traditional food has it own flavor.	4.38	0.888
Acceptance	I prefer to eat Malay traditional food more than any others food such as fast food and western food.	3.75	1.017
	I always try to learn how to cook Malay traditional food.	3.97	1.047
	I like the presentation and preference of Malay traditional food.	4.10	0.887
	Malay traditional food is more delicious than the other modern food.	3.82	0.997
	I will invite my friend to eat Malay traditional food.	4.07	0.939
	I was familiar with Malay traditional food	4.15	0.915

Food image scored the highest (M= 4.1225, SD= 0.6325). The mean score of the seven (7) substances ranges from 3.86 to 4.38. The lowest to highest score was stated as 'Traditional Malay food was highly promoted in social media and internet.. ' (M=3.86, SD=1.251). 'I am more satisfied with the quick service that is offered in modern food restaurants than in Malay traditional' food restaurant.' (M=3.93, SD=0.968), 'Traditional Malay food is cheaper than the other modern food such as fast food.' (M=3.96, SD=0.925), 'I was satisfied with Malay traditional's food taste. ' (M= 4.16, SD= 0.838, 'The raw material to cook Malay traditional food is easy to find at my place.' M=4.25, SD=0.829, "Traditional Malay food is easy to find at my place.", M=4.31, SD=0.830. Last but not least, 'Traditional Malay food has its flavour.' got the highest mean score (M=4.38, SD=0.888)

Food knowledge scored the second highest (M=3.8284, SD=0.74711). The mean score of the eight (8) questions ranges from 3.28 to 4.51. The query with the highest 'I always eat Malay traditional food during the festival such as Hari Raya Aidilfitri and Hari Raya Aidiladha..' (M=4.51, SD=0.816) followed by 'I was exposed to Malay traditional food since childhood.' (M=4.23, SD=0.987), 'My parents cook Malay traditional food at home.' (M=4.03, SD=1.107), 'My parents teach me how to cook traditional Malay food.' (M=3.84, SD=1.155), 'I help my parents when they cook Malay traditional food', (M=3.78, SD=1.112), 'I know how to cook any Malay traditional food.' (M=3.58, SD=1.137), 'My friends teach me how to cook traditional Malay food.' (M=3.38, SD=1.314) Lastly, 'Malay traditional food it is hard to cook and prepare.' (M=1.231, SD=1.231).

Food attitude scored (M=3.6968, SD= 0.71664). . The mean score of the seven (7) questions on food attitude ranges from 3.36 to 4.42. The highest to lowest score was reported as 'I like to eat traditional Malay food.' (M= 4.42, SD=0.784), 'I always eat Malay traditional food at home.' (M=3.82, SD=1.162), 'I think that Malay traditional food needs a lot of time to cook.'(M=3.62, SD=1.048), 'I prefer to eat Malay traditional food because it is healthier.' (M=3.59, SD=1.079), 'I always eat Malay traditional food at the restaurant.' (M=3.57, SD=1.148), "I always eat Malay traditional food with my friend at the restaurant." (M=3.50, SD= 1.155). Lastly, the lowest mean is 'I think that Malay traditional food is hard to prepare' with (M=3.36, SD=1.151)

The dependent variable acceptance scored (M=3.9792, SD=0.78119). The mean score for 6 questions in acceptance ranges from 3.75 to 4.15. The highest to lowest was reported as 'I was familiar with Malay traditional food' (M= 4.15, SD= 0.915, 'I like the presentation and preferences of Malay traditional food' (M= 4.10, SD= 0.887, 'I will invite my friend to eat Malay traditional food' (M= 4.07, SD= 0.939), 'I always try to learn how to cook Malay traditional food' (M= 3.97, SD= 1.047, 'Malay traditional food is more delicious than the other modern food' (M= 3.82, SD= 0.997). The lowest is 'I prefer to eat Malay traditional food more than the others modern food such as fast food and western food' (M= 3.75, SD= 1.017)

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Food Knowledge	8	0.824
Food Attitude	7	0.786
Food Image	7	0.759
Acceptance	6	0.892

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H$_1$: There is relationship between food knowledge and the acceptance of traditional food among generation Z.	0.669	H$_1$ is supported
H$_2$: There is significant relationship between food attitude and the acceptance of traditional food among generation Z.	0.697	H$_2$ is supported
H$_3$: There is relationship between food image and the acceptance of traditional food among generation Z.	0.674	H$_3$ is supported

The result in Table 4 indicates that the food knowledge and acceptance value is 0.669, which indicates a strong linear relationship. Following food attitude and acceptance showed 0.697, indicating also a strong linear relationship. Meanwhile, food image and acceptance 0.674, indicating the same strong linear relationship.

DISCUSSION AND RECOMMENDATION

Discussions are aimed at solving questions and addressing hypotheses, as mentioned in the first chapter of this study. In general, this study has extensively researched the awareness of the acceptance of traditional food among the young generation Z generation in Malaysia.

The first step in improving future research is to conduct background research. Try to learn as much as possible about the research target, the industry, and the terminology. Thus, it can lead to the researcher having good data to improve the research. As a result, reliable data can also inform researchers about the background study on Malay traditional food acceptance among generation z.

Finally, the future researcher was strongly advised to select the most appropriate research methods for the study. The quantitative method was chosen to collect data from the respondents in this study. It was more convenient and took less time to collect data. Because it

is simple for a researcher to obtain a large number of respondents at once, the questionnaire can be distributed to the targeted respondents in a specific location. The respondents who will be targeted are those who have previous or current experience and can assist in answering the questionnaire.

CONCLUSION

In conclusion, this study has been accomplished to discover the acceptance of traditional food among generation Z. Three independent variables, namely food knowledge, food attitude, and food image, have been chosen to examine their relationships with the dependent variable, generation- Z acceptance. A total of 400 respondents were selected from 18 to 30 years old. Overall, based on Pearson's correlation analysis, food knowledge scored a value of *0.669, followed by food attitude with *0.697, and food image with *0.674. These three variables showed a moderate positive relationship.

ABSTRACT

This study discusses the effectiveness of Dineserv on Customer Satisfaction in Kelantan Hipster Café. This study also aims to identify the influences of service quality, price, facility aesthetic, and food quality which then can identify the extent of customer satisfaction in their service performance. Questionnaires were distributed to 390 respondents via a google form. Descriptive analysis, reliability analysis, and Pearson coefficient of correlation analysis were applied to the usable data. The results show a significant relationship between service quality, price, facility aesthetic, ad food quality. The findings of this study provide a hold on Hipster Café to extend its strategy to meet the desire to revisit customers.

Keywords: Customer Satisfaction, Service Quality, Price, facility Aesthetic, Food Quality, Kelantan Hipster Cafe

INTRODUCTION

The hospitality industry may be a vast sector, and plenty of people think about its reasonable organization that considers hospitality brands. A less significant number can explain what it is and whether the corporate is fair and proper. The hospitality industry offers enjoyable and cosy experiences and services to guests worldwide (Rajaratnam, & Konar, 2018). Restaurants and cafes are essential facilities in the hotel industry. The food and beverage industry contributes a lot to the profit of the hotel industry (Naderian & Baharun, 2015). With the growing importance of business meetings and a series of personal and social events, the number of customers visiting restaurants is increasing. Restaurant operators in the food and beverage industry work relentlessly to improve the customer experience.

The hospitality industry refers to various organizations and administrations related to recreation and customer satisfaction. Aspects of hospitality characteristics, the industry also focuses on the opposite, providing food for basic needs and values about thoughts of luxury, pleasure, and experience. They also outlined some parts of the hospitality industry, for example, hotels, restaurants, cafes, and takeaways. The restaurant is both a producer and a service provider, serving customers as a service provider and preparing meals as a producer. Put another way, the tangible and intangible interact (Nor Azureen & Shahril, 2016). To understand the role of a restaurant as a service, suppliers should consider the relationship between consumers and employees when serving customers, greeting them, accepting orders, or providing services, and to better understand the taste of food as a product, quality, and meal costs.

With the trend of dining out nowadays, people are attracted to cafes that can improve their quality of life and give them different dining experiences, especially at themed cafes (Wan Nawawi, Wan Kamarudin, 2018). On the other hand, consumers have recently been visiting coffee shops for various purposes, such as meetings, learning, and fun time alone, except for coffee. Furthermore, the local coffee shop has been in business since at least the early 1900s and has always been one of the main meeting points for locals to share ideas and talk in places other than their homes. In addition, in the past few years, coffee shops of various brands have sprung up in towns and cities in Malaysia.

Next, customer satisfaction is important to customers because of the increased number of customers in cafes and the trend in coffee consumption. Besides, service quality also affects customer satisfaction (Beh, Leong, Wong, & Yap, 2014). The quality or taste of coffee is no

longer the most crucial factor in attracting customers. Many people now choose coffee shops because of the atmosphere. According to this research, elements that contribute to customer satisfaction in the Hipster Café are service quality, price, facility aesthetics, and food quality (Ibrahim & Hashim, 2017). There are four objectives of this research:

1. To identify the relationship between service quality and customer satisfaction in Hipster Café.
2. To determine the relationship between price and customer satisfaction in Hipster   Café.
3. To examine the relationship between facility aesthetics and customer satisfaction in Hipster Café.
4. To examine the relationship between food quality and customer satisfaction in Hipster Café.

Significance of the Study

Marketers

As a result of this research, marketers will better understand current coffee trends and be able to execute relevant marketing tactics for their coffee business. Furthermore, this enables the existing coffee shop to continue to improve service quality and its service landscape to attract new clients

Food and Beverage Industry

Based on this study, with the rapid development of modern coffee shops, marketers face the challenge of understanding why customers may be discouraged from revisiting modern coffee shops. This gives marketers and modern coffee shop owners a better understanding of the factors that bring back customers. This research will go into greater detail on the current state of coffee shops in Malaysia. This study, which is also focused on coffee type, aims to determine consumer knowledge about the various types of coffee available on the market.

Ministry of Tourism Industry

The results of this survey will help governments identify and improve the market share of traditional coffee shops. This study may also help the government establish guidelines for restoring historic traditional coffee shops. Appropriate policymaking can provide more opportunities for young entrepreneurs participating in the coffee shop industry.

LITERATURE REVIEW

Service Quality

The service quality model is used to influence the service quality to increase customer satisfaction and loyalty. Service quality consists of the following dimensions: reliability, empathy, responsiveness, assurance, and tangible. Responsive also involves understanding the needs and customer wishes, appropriate operating hours, individual attention given by staff, and attention to customer problems and safety. Reliability is the ability to perfect services promised accurately or after sticking to a promise. This is a critical dimension because all customers want to deal with the company or organizations that stick to promises (Alom et al., 2019; Yusof & Abdul Raheem, 2017). Assurance is defined as the knowledge and decency of staff towards their ability to cultivate confidence and trust. According to (Alamsyah & Guruh Fajar, 2019). With the assurance, customers will get the service as promised. Empathy is defined as a concern in giving special attention to the customer. Empathy can also be said to be caring and providing service to customers. Customers are treated as unique people and special. With that service, they may feel that they are prioritized by the organization.

Price

Price is regarded as the only factor in the marketing mix to generate revenue (Sang-Hyeop Lee, Jong Ho Lee, & Pong Chee Weng, 2016). Price is the primary criterion for product evaluation, and any company should have a price management strategy. In addition, to providing competitive prices, companies must also match the price with the quality and quantity of the

product. Next, the price can also create customer satisfaction and customer loyalty. Price has become a key factor in the customer's response to the value of the product (Perlis, Sheriff, Ismail, Iwani, Bakar, & Damain, 2016). Generally, if the quality of the product exceeds the cost the customer spends, the customer will be satisfied. Setting the right price is important because the price will determine the satisfaction or value each customer gets from the product. This situation shows that the objective and perceived prices are very significant factors in the evaluation. Perceived price can provide customers with more information than financial terms, and it is suitable for evaluating quality (Indrayani & Pardiyono, 2020). The price is fair, and the price is equal to the value and effectiveness of the product, which is one of the aspects that significantly affect satisfaction.

Facility Aesthetic

A café is incomplete without an attractive design. Many people visit the cafe just to get pictures that follow the latest trends and eat the latest food. The millennial generation realizes that a good cafe experience requires good cafe design. However, cafe owners sometimes overlook that cafe principles differ from restaurant principles. As a result, when building a coffee shop, the concept of interior design appropriate for the restaurant is not always used. By facilitating customer activities to provide a relaxed and comfortable environment to the public, the customer's support room should be designed or adapted to the behaviour of the people around. (Karjodihardjo & Honggowidjaja, 2015). People are more eager to dine in coffeehouses, not only because they offer a diverse menu but also because of changes in lifestyle and trends in Malaysia.

Food Quality

In the DINESERVE model, food quality was proved to be the most essential dimension affecting customer satisfaction. In the food service industry, food quality is important. The quality of the cuisine and the quality of the raw materials are both critical in increasing the menu's effectiveness and making it a selling tool for the restaurant. The food quality influences customer evolution in different categories of restaurants. The quality of their food mostly determines restaurant diners' contentment. People generally go to restaurants for food in their leisure time, and quality is always a big factor. The safety of the food determines food quality. (Mwove, Imathiu, Orina, & Karanja, 2020). Humans are naturally curious about everything that has to do with them, such as what they wear, what they eat, and how they feel. Customers express their willingness to visit the restaurant for the taste of the meal and to return in the future because of the high quality of the food. Customers are willing to spend more if the meal is of high quality. The food quality influences customer happiness. The findings indicate that the relationship between service and food quality significantly impacts customer happiness, which will help in customer retention in the future. (Kumar, & Bhatnagar, 2017)

Customer Satisfaction

Customer satisfaction is created when the products or services provided by the company can meet or exceed customer expectations. (Khadka, Kabu, & Soniya, 2017), Great customer satisfaction and high customer retention are essential in a cafe, restaurant, or product. they They define customer satisfaction as "the number of customers, or percentage of total customers, reported experiences with a firm, its products, or services (evaluation) exceeding a set satisfaction goal" e.g., and it is better than competitors who are also able to explain customer satisfaction. Understanding customer needs is the first step in developing customer relationships that focus on loyalty, retention, and long-term relationships. To identify customer needs, managers need to devise strategies on how to satisfy them and ito satisfy them. Implementing these strategies into operational practice is the best way to build satisfaction and positive intentions among restaurant customers (Shahzadi, Mariam, Malik, & Mansoor, 2018).

Research Hypothesis

Literature review shows that independent variables such as food quality, aesthetic facilities, and price affect the Effectiveness of DineSERV on Customer Satisfaction in Kelantan Hipster Café. Therefore, the study intends to examine the Effectiveness of DineSERV on Customer Satisfaction in Kelantan Hipster Café. Based on the literature discussed, the hypotheses of this study are summarized in the following way:

H_1 There is a positive relationship between service quality and customer satisfaction in Hipster Cafe

H_2 There is a positive relationship between price and customer satisfaction in Hipster Café

H_3 There is a positive relationship between facility aesthetic and customers satisfaction in Hipster Café

H_4 There is a positive relationship between food quality and customers satisfaction in Hipster Café

Research Framework

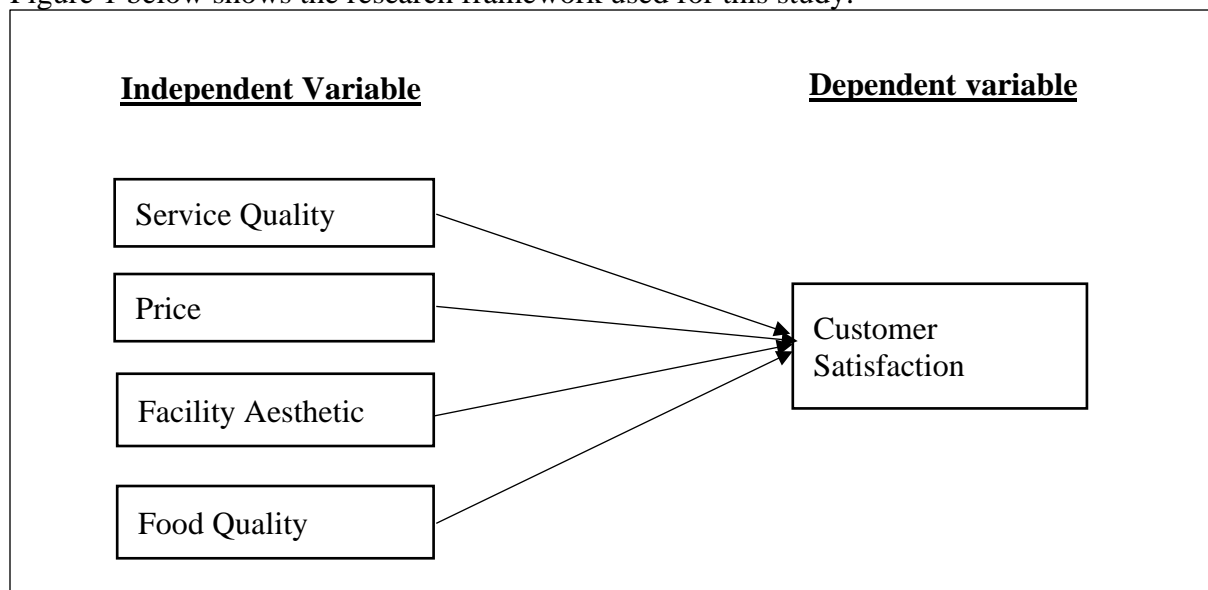
Figure 1 below shows the research framework used for this study.


Figure 6: Research Framework

METHODOLOGY

Research Design

This study used the quantitative method where questionnaires were distributed to the 390 customers who visit modern coffee shops that are ranked four stars and above which is Kopi Mesin Cafe, Jiwa Kopi, and Bingsu, Al-Khatiri Koffee, Sabye Sabye Café in Kelantan. The target population of the study in this research is the population of Kelantan.

The researcher divided the questionnaire into 5 sections: A, B, C, D, and E. Section A is for the respondents' demographic profile as gender, age, and occupation. For Section B, C and D, the questions elaborated more on the dependent and independent variable, which discussed about the service quality, price, facilities esthetic, and food quality, while the dependent variable is about customer satisfaction, were examined in the survey. This questionnaire used the format of 5-point Likert scales of agreement. The respondents can answer the question by choosing their desired scale. Likert Scale is the level of the respondents agreeing with the sequence of the statement that is regarding the questions. 5-point Likert scale with a closed-ended questionnaire scale ranging from 1 (Strongly Disagree), 2 (Disagree), 3 (Neutral), 4 (Agree) and 5 (Strongly Agree) was used for this study.

Data Collection

The data collection used in this study is primary data to answer. The data collection was conducted using questionnaires. The questionnaire is the most widely used data collection technique since each respondent is asked to answer a set of questions, which allows the researcher to collect many responses efficiently. This study chose to distribute the questionnaires using the Google form application to WhatsApp, Instagram, and Facebook. It was very saving time and cost to answer questions.

Sampling

In this study, non-probability sampling was used, while the unit of sample was selected by using convenience sampling. A convenience sample is made up of people who are most easily accessible to the researcher. This study uses this method because questionnaires were prepared and distributed online to social media stories of a personal message to gather information from the respondents

$$S = \frac{x^2 N p (1 - P)}{e^2 (N - 1) + x^2 p (1 - p)}$$

Table 32: Population

City Name	Population
Kelantan	The total population of Kelantan is estimated to increase from 707.30 thousand people in 1970 to 1906.70 thousand people in 2020.

Data Analysis

Five types of data analysis were used in this study: descriptive analysis, reliability analysis, correlation analysis, pilot study, and normality test. The data obtained were analyzed by using SPSS version 27.

FINDINGS

Result of Frequency Analysis

Table 33: Frequency Analysis

Characteristics	Frequency	Percentage (%)
Gender		
Male	153	39.2
Female	237	60.8
Age		
18-21	73	18.7
22-25	212	54.4
26-30	55	14.1
31-35	21	5.4
36-40 above	29	7.4
Race		
Malay	376	96.4
Chinese	7	1.8
Others	7	1.8

Table 2 shows the characterization of respondents. 153 out of 390 respondents are male, representing 39.2%, while 237 respondents are female, representing 60.8%. 96.4% of the respondents are Malays, 1.8% of the respondents are Chinese, and 1.8% of the respondents are

other. The highest percentage is 54.4% of the respondents are 22 to 25 years old, and 18.7% of the total respondents are 18 to 21 years old. 55 respondents are from 26 to 30 years old, making it 14.1% out of total. 36 to 40 years old respondents are 7.4% and the lowest is 31 to 35 years old, just 5.4% out of total.

Result of Descriptive Analysis

Table 34: Descriptive Analysis

Variable	Item	Mean Score	Standard Deviation
Service Quality	The service quality is used to influence the customer in order to be able to increase customer satisfaction and loyalty.	4.6026	0.61137
	Service quality "Tangible". Hipster café staff's physical attractiveness delivers service including their clothing styles and looks attraction at hipster café very interesting.	4.4000	0.72700
	Service quality "Assurance". Hipster cafés always assurance to the customers will get the service as promised.	4.3846	0.7247
	Service quality "Responsive". Hipster café also understands the needs and customer wishes, appropriate operating hours, individual attention given by staff, attention to customer problems, and safety.	4.3821	0.72784
	The quality of service "Empathy" hipster café is always concerned and provides service to customers. Customers are treated as unique and special people.	4.3385	0.75087
Price	Price is a key factor in stimulating customers to purchase.	4.4949	0.73034
	Personalization reduced the similarity across competing products or brands, thus, making a direct price comparison more difficult for customers.	4.2744	0.81698
	Price competition is reduced when the cost of searching for prices is higher than the cost of searching for the product.	4.2436	0.82359
	Suitability of the price the quality of the menu served at the Hipster Coffee because the ingredients for making a menu are very high quality.	4.4077	0.73505
	The price has a positive and significant effect on customer satisfaction at Hipster Café.	4.3718	0.71540
Facilities Aesthetic	The main attraction when visiting the Hipster café is the beautiful café design.	4.5897	0.65396
	Nowadays, many people visit cafes that have a beautiful atmosphere and are suitable for taking a picture.	4.5128	0.73375
	Interior design will influence the mood of customers as well as the orders they make.	4.5128	0.71242

	The quiet and comfortable atmosphere of the hipster café can attract teenage customers to complete assignments while eating food in peace.	4.5205	0.70499
	The attractive design and decoration of the hipster café can provide a quieter atmosphere than a regular restaurant.	4.5256	0.69749
Food Quality	Food quality is one of the key components of customer perspective at Hipster Café to attract incoming customers.	4.5308	0.70096
	Product features such as food quality enhance good emotions in Hipster Café customers.	4.4564	0.71839
	Adequate and appropriate taste of food gives satisfaction to customers.	4.5000	0.70529
	The temperature level of the food is in certain conditions according to the food such as hot and cold.	4.4385	0.75548
	Hipster Café uses ingredients that are still fresh and fresh before, during, and after food preparation.	4.4692	0.74711
Customer satisfaction	The pillars of the organization's effectiveness and profitability are service quality and client satisfaction.	4.5923	0.63363
	The customer will be satisfied if his or her expectations are met.	4.5923	0.63767
	The consumer will be very delighted if the dealer is able to give more than what the consumer expects.	4.6051	0.65950

"Service quality" scores showed (mean =4.4215, SD =0.52235), indicating that service quality determined customer satisfaction since respondents agreed with most of the items. Respondents agreed that service quality is used to influence the customer to be able to increase customer satisfaction and loyalty (mean =4.6026, SD =0.61137). Respondents agreed that Service quality is "Tangible". Hipster café staff's physical attractiveness delivers service, including their clothing styles and looks at hipster café exciting (mean = 4.4000, SD = 0.72700). In addition, respondents agreed that service quality is "Assurance". Hipster café always assurance the customers will get the service as promised (mean = 4.3846, SD =0.72472). Service quality "Responsive". Hipster café also understands the needs and customer wishes, appropriate operating hours, individual attention given by staff, attention to customer problems, and safety (mean = 4.3821, SD = 0.72784). The quality of service "Empathy" hipster café is always concerned and provides service to customers. Customers are treated as unique and notable people (mean =4.3385, SD =0.75087).

Price is a crucial factor in stimulating customers to purchase score (mean =4.4949, SD =0.73034). Respondents agreed that the personalization reduced the similarity across competing products or brands, thus, making a direct price comparison more difficult for customers (mean= 4.2744, SD =0.81698). Respondents also agreed that price competition is reduced when the cost of searching for prices is higher than the cost of searching for the product (mean =4.2436, SD=0.82359) and the suitability of the price and the quality of the menu served at the Hipster Coffee because the ingredients for making a menu are a very high quality (mean= 4.4077, SD= 0.73505). Respondents agreed that the price positively and significantly affects customer satisfaction at Hipster Café (mean = 4.3718, SD= 0.71540). Triatmanto (2020) defined price as something that can be measured which consists of several indicators such as the affordable price, discounted price, and suitability price.

The main attraction when visiting the Hipster café is the beautiful café design (mean =4.5897, SD= 0.65396), and many people visit cafes with a beautiful atmosphere and are suitable for taking pictures (mean=4.5128, SD= 0.73375). Next, the respondents commented that interior design would influence the mood of customers as well as the orders they make gave a positive feeling (mean= 4.5128, SD= 0.71242), and the quiet and comfortable atmosphere of the hipster café can attract teenage customers to complete assignments while eating food in peace (mean= 4.5205, SD= 0.70499). The attractive design and decoration of the hipster café can provide a quieter atmosphere than a typical restaurant got (mean =4.5256, SD= 0.69749).

The food quality is one of the critical components of customer perspective at Hipster Café to attract incoming customers and show results (mean = 4.5308, SD = 0.70096). Product features such as food quality enhance good emotions to Hipster Café customers (mean= 4.4564, SD= 0.71839). The adequate and appropriate taste of food satisfies customers (mean= 4.5000, SD= 0.70529). Next, the temperature level of the food is in certain conditions according to the food, such as hot and cold scores showed (mean= 4.4385, SD= 0.75548). Lastly, Hipster Café uses ingredients that are still fresh and fresh before, during, and after food preparation (mean= 4.4692, SD= 0.74711)

The dependent variable – customer satisfaction scored (mean =4.5966, SD = 0.52712). Respondents strongly agreed that they were satisfied with the organization's effectiveness and profitability pillars: service quality and client satisfaction (mean =4.5923, SD= 0.63363). Customer respondents will be satisfied if their expectations are met (mean= 4.5923, SD= 0.63767). Overall, respondents were satisfied that the consumer will be very delighted if the dealer can give more than what the consumer expects (mean= 4.6051, SD= 0.65950).

Result of Reliability Analysis

The Table 4 below shows the result of reliability analysis

Table 35: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Service Quality	5	0.621
Price	5	0.579
Facility Aesthetic	5	0.648
Food Quality	5	0.626

Reliability analysis for performance expectancy is shown in the table. The alpha coefficient of Cronbach shows a value of 0.938, which is indicated as very good. Therefore, the questionnaire is accurate and can be used for the study. In the questionnaire, the effort expectancy variable is accurate and can be used for the research.

Result of Pearson Correlation Analysis

Table 5 below shows the Pearson Correlation Analysis Between Service Quality, Price, Facility Aesthetic, and Food Quality on Customer Satisfaction towards Hipster Café in Kelantan

Table 36: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H1: To identify the relationship between service quality and customer satisfaction in Hipster Café.	**0.621**	**Supported**
H2: To determine the relationship between price and customer satisfaction in Hipster Café.	**0.579**	**Supported**
H3: To examine the relationship between facility aesthetics and customer satisfaction in Hipster Café.	**0.648**	**Supported**
H4: To examine the relationship between food quality and customer satisfaction in Hipster Café.	**0.626**	**Supported**

The result in Table 5 indicates that service quality and customer satisfaction were .621, which indicated a moderate linear relationship. Following price and customer satisfaction showed .579 indicating a moderate linear relationship. Meanwhile, facilities aesthetic and customer satisfaction showed .648, indicating a high positive linear relationship and the result for food quality is .626. All four variables positively correlated with customer satisfaction, and the relationship is significant ($p<0.01$).

DISCUSSION AND RECOMMENDATION

Discussions aim to resolve questions and address hypotheses as described in the first chapter of this study. In general, this study has extensively studied the effectiveness of dineSERV on customer satisfaction in Kelantan hipster cafés. Based on the study's findings, the researcher will provide theoretical, methodological and practical suggestions that can be made in future studies. Future studies should use other variables as independent variables, customer satisfaction, because the study's findings show that Hipster café is a phenomenon for the community in Kelantan. It may affect the performance of Hipster café in Kelantan.

Researchers also recommend using quantitative methods for any research on this topic because it can obtain data faster than qualitative methods. Qualitative researcher data collection tool kits are quite diverse, ranging from fully unstructured to semi-structured techniques. Since the data is numerical, statistical tests can be used to make statements about the data using quantitative methods. For future research, several challenges need to be highlighted. Future studies need to create other methods to get superior results, such as the interview method or some open-ended questions for respondents to get a high response rate, good description and better understanding. Next, the researchers only focused on three determinants without knowing that other determinants may play an essential role in determining customer satisfaction. The scope of the study will be more comprehensive, and more information can be accessed.

CONCLUSION

This study aims to determine the Effectiveness of DineSERV on Customer Satisfaction in Kelantan Hipster Café. This study aims to determine the impact of service quality and service scrap on customer satisfaction in hipster café. As a result, marketers must determine which characteristics will most impact attracting customers.

Pearson Correlation Analysis was used to determine the relationship between the independent and dependent variables. This shows how the dependent variable affects the independent variable. The findings suggest a significant association between food quality, facilities aesthetic, price and customer satisfaction. In conclusion, this study proves that the independent variable between food quality, aesthetic facilities, and the price has a positive correlation. The data show that customer satisfaction strongly influences individuals to visit hipster cafés.

ABSTRACT

The objectives used were to study students 'perceptions of restaurant service during the covid-19 recovery period, identify factors influencing university students to dine in restaurants and the number of customers eating at restaurants during the covid-19 recovery period. The study was conducted in a restaurant. In addition, the method used to complete this report is through questionnaires to students through observations, questionnaires, and references. Findings show restaurants are essential for students to eat and buy food and so on. In addition, it was also identifiable that students were concerned about what factors influenced them when eating at a restaurant during the covid-19 recovery period.

Keywords: Covid-19, Restaurant, Foods, Students and University.

INTRODUCTION

In this chapter, the study findings are relevant to restaurants for a fun and comfortable experience and service. The restaurant industry is one of the fastest-growing industries in the global market and is proliferating in Malaysia. Various types of restaurants with different products and concepts prove the emergence of the restaurant industry. 2 Malaysia is moving fast with the direction in the restaurant industry along with developed and developing countries around the world. Coronaviruses are a group of viruses that can cause animals or humans, and Covid-19 is an infectious disease caused by the recent coronavirus pandemic that has posed an unprecedented threat to the world economy. In particular, restaurants proved to be the worst hit by the COVID-19 pandemic due to the high risk of air and environmental pollutants in restaurants (AHLA, 2020). By 2020, it is estimated that nearly 50% of worldwide restaurant revenue will decline due to this widespread virus, based on historically low occupancy rates (38%), the lowest since the Great Depression in 1933 (AHLA, 2020).

Moreover, the worldwide hotel industry will take approximately five years to achieve pre-COVID-19 occupancy, average daily rate (ADR), and revenue (Dube K, 2020). This indicates that the redevelopment of the hotel industry is very slow as a result of this pandemic. The crisis has caused the hotel industry to be unable to operate, including restaurants. This study consists of three objectives:

1. To examine the relationship between time saving and factors influencing university students to dine in at a restaurant.

2. To analyse the convenience of the restaurant based on factors that influence university students to dine in at the restaurant.

3. To examine the link between factors that influence university students to dine in at restaurants and the cleanliness of the restaurant

Significance of Study

Restaurant cleanliness satisfaction is critical to university students. This study was conducted to determine factors that cause university students in Malaysia to often eat at restaurants. The hospitality industry and future researchers will benefit from this study to plan new strategies to further improve the level of cleanliness and convenience of restaurants to maintain their market. The industry may face many challenges and try to resolve any issues of dissatisfaction from university students while improving their services. The industry can also explore the influence of quality online food providing fast food and drink. Still, cleanliness is emphasized in the satisfaction of university students and their loyalty. They will learn that university students' perceptions may differ in different circumstances. It will help the industry better understand university students and improve their needs and wants by making the right choices when dining at restaurants during the Covid-19 recovery period. Thus, this study will help future researchers further improve their research quality.

LITERATURE REVIEW

Time Saving

Since the endemic phase launched by the government where all sectors have been permitted to resume operations, after so long, not operating due to compliance with the MCO, this has allowed various companies to resume operations, especially in the food and beverage sector. Due to many enterprises, especially the food and beverage factor, the restaurant is back in operation. Many people have taken the opportunity to eat at restaurant, especially university students. One of the traceable factors why university students choose to eat in restaurants is time-saving factors. Referring to (Alom et al., 2019; Valerie Tandoi, n.d) explained that enjoying food in a restaurant can save time, especially if it is a fast-food restaurant. This is agreed by many people, especially those working class who have limited time to cook at home and choose to eat in restaurants. 11 This situation is also supported by several university students also have limited time to prepare their cuisine due to the density of their classes. University students also have barriers to cooking on their own, especially for those in college, because of the need to comply with instructions that do not allow the use of any cooking utensils due to safety factors. Thus, it is clear that the choice to dine in a restaurant is due to time-saving factors.

Convenience

University students can be observed that they are very open to dining in restaurants for a variety of factors. Du (2021) once said that students are also among the higher groups that hold high statics where they often choose to eat out of their college, which means eating in the restaurant at least once a week. Besides, it also can be seen that university students often choose fast food restaurants and coffee shops. Teenagers nowadays, especially university students, prefer to be in a comfortable place where they can spend time with friends or enjoy their own time comfortably. Several restaurants operating mainly in the endemic phase have now largely followed the trend trends in line with the tastes of young people. Thus, many university students indirectly choose to enjoy food in restaurants due to the comfort factor in the restaurant of their choice. (Nusra, 2021) also once said that the increase in the percentage of customers who attend to enjoy food in restaurants is higher compared before. This can be identified when customers seem trusting and comfortable with the restaurant services provided. The delivery service provided by the restaurant is very satisfactory when the restaurant is operating during a time when people cannot enjoy food in the restaurant, and now their customers who know and are satisfied with their service have decided to eat at the restaurant especially now that the situation is back to the endemic phase.

Cleanliness

Among other factors that motivate university students to eat in restaurants in the endemic phase is cleanliness. Referring to (Integrity Services, 2018) says that the cleanliness factor is one of the factors influencing the ambience of one of the restaurants. Apart from the menu and service factors that satisfy the customers, especially university students, it also emphasizes the cleanliness of the restaurant, especially during the season that is prone to various diseases. Although the restaurant provides excellent customer service and delicious food, there will be no customers comfortable enjoying food in a dirty and unmanaged restaurant. Besides, (Integrity Services, 2018) says that restaurant cleanliness factors also symbolize the trust and safety that their customers can give. Even though we are living in an endemic phase, the covid-19 virus is still circulating and the situation can still be controlled. Therefore the restaurant needs to focus on the cleanliness of the premises to convince customers to enjoy the food and services provided in the restaurant. 14 Cleanliness is one of the critical factors nowadays to preventing covid-19 virus infections. Therefore, the customers, especially university students, are very concerned about cleanliness, which they gain confidence in dining in the restaurant. Thus, the cleanliness factor is one of the factors that motivate the community, especially university students, to dine-in in a restaurant.

Research Hypotheses

The hypothesis in this study is to find out factor's restaurant is related to University Students.

H₁	**There is the relationship between time-saving and factors that influence university students to dine in at a restaurant during covid 19 recovery period**
H₂	**There is the relationship between convenience and factors that influence university students to dine in at a restaurant during covid 19 recovery period**
H₃	**There is the relationship between cleanliness and factors that influence university students to dine in at a restaurant during covid 19 recovery period**

Research Framework

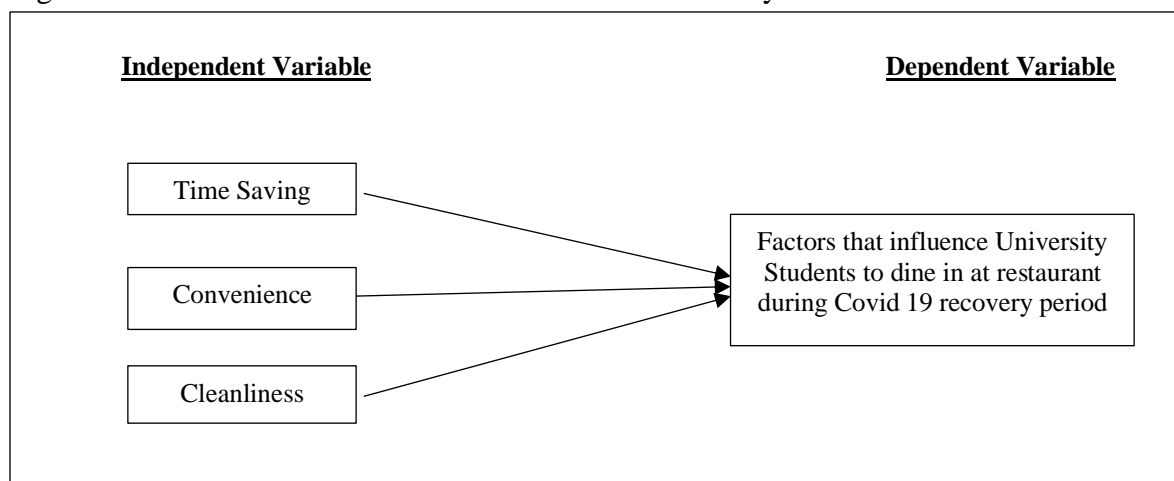
Figure 1 below shows the research framework for this study.


Figure 7: Research Framework

METHODOLOGY

Research Design

Research design refers to the framework of market research methods and techniques that a researcher chooses. The design that the researchers choose allow them to utilise the methods that are suitable for the study and to set up their studies successfully in the future as well.

There are two types of study, which are quantitative and qualitative. The quantitative study is used to collect and analysing the data, for quantitative design have four core descriptive, correlation, quasi-experimental and experimental. Meanwhile, qualitative study is the methodology that researchers use to gain deep contextual understandings of users via non-numerical means and direct observations.

Data Collection

Data collection is collecting, measuring, and analysing objective evidence for research purposes using established and approved procedures. The survey of this study used a self-service data collection mode in which the respondent was asked to fill out the questionnaire from the google form themselves. The questionnaire will be sent to individuals to answer. After agreeing to fill out the question, the respondent is explained.

Sampling

Sampling is choosing a subset of a population to serve as a sample. The accuracy and cost-effectiveness of research are improved through sampling. 384 participants were selected using simple random sampling. It's one of the simplest systematic sampling methods to gain a random sample. Simple random sampling is typically used where there is little known about the population of participants. Researchers also need to make sure they have a method for getting in touch with each participant to enable an actual population size to work from. It can avoid the occurrence of unwanted effects.

$$\frac{x^2 Np\,(1-p)}{e^2(N-1) + x^2 p(1-p)}$$

n = sample size

N = population size

e = acceptable sampling error

x^2 = chi square of degree of freedom 1 and confidence 95% = 3.841

P = proportion of population (if unknown 0.5)

Data Analysis

Data analysis is the most essential component of the research. Data analysis tools assist users in processing and manipulating information, analysing relationships and connections between data sets, and detecting perception patterns and trends. Data analysis is the process of converting raw data into structured information to understand the issues raised by the research. The Statistical Package for Social Science (SPSS) system was used to analyse the survey question. Pie charts, tables and graphs were used to illustrate the result. The study findings reported in the paper are intended to explain the answer to the research question about using e-commerce.

FINDINGS

Frequency Analysis

Table 1: Below shows the frequency analysis for this study

Variables	Number of Respondent (N)	Percentage (%)

Gender			
Male	**182**	**47.4%**	
Female	**202**	**52.6%**	
Race			
Malay	**129**	**33.6%**	
Chinese	**39**	**10.2%**	
India	**59**	**15.4%**	
Bumiputera Sabah	**112**	**29.2%**	
Bumiputera Sarawak	**45**	**11.7%**	
Age			
18 - 20 years old	**84**	**21.9%**	
21 - 25 years old	**237**	**61.7%**	
26 – 30 years old	**63**	**16.4%**	

A total of 384 respondents have been collected in this research. There were 182 (47.4%) respondents who represented males and 202(52.6%) respondents who represented females. It shows that the number of female respondents is higher than the male respondents in this research. Age is divided into the three categories. There were 84(21.9%) respondents aged 18-20 years old. Next, the respondent is in aged 21-25 years old, which were 237 (61.7%). And the last category for 26-30 years old is 63(16.4%) respondents. Next is the race of the respondent. There have 5 categories for the race, which are Malay, Chinese, Indian, Bumiputera Sabah and Bumiputera Sarawak. For Malay is 129 respondents (33.6%), and for Chinese 39 respondents (10.2%). Next, India had 59 respondents (15.4%), Bumiputera Sabah had 112 respondents (29.2%), and the last category is Bumiputera Sarawak with 45 respondents (11.7%). The table shows the year of study. Years of study have 4 categories. Year 1 have 82 respondent (21.4%), year 2 have 146 respondent (38.0%). Next year 3, 29 respondents (7.6%) and the last category, year 4 29 respondents (7.6%).

Descriptive Analysis

Table 2 below shows the Descriptive Analysis.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Time Saving	Ordering fast food is seen to save more time compared to cooking on your own, especially among students.	3.58	1.059
	The density of the daily schedule possessed by the students prompted them to choose fast food on the time - saving factor.	3.63	1.014
	The students do not have enough time to cook on their own due to being too focused in completing the assignments given by the university.	3.64	.913
	Students prefer to order fast food to save time and use that	3.51	.991

	time to study the lesson more focused.		
	Students can enjoy more leisure time if they choose to order fast food and enjoy that time.	3.77	.993
	The students were seen to have a good rest time after getting tired of doing homework when they ordered fast food rather than choosing to cook on their own	3.69	.873
Convenience	There are complete basic facilities such as public toilets and a surau.	3.86	.968
	The restaurant area is strategic to visit and has ample parking.	3.86	.955
	Efficient spot cleaning service.	3.79	.976
	The restaurant follows the SOPs set by the government.	3.92	1.739
	Provide more than one hand wash and provide soap and tissues.	3.75	1.007
	Provide a QR code scanner for customers before entering the restaurant.	3.85	.894
Cleanliness	Cleanliness is a practice that should be practiced by an individual.	3.98	.976
	The condition of the restaurant meets the criteria recommended by the government.	3.92	.936
	Restaurants should adopt cleanliness practices during the Covid 19 recovery period.	3.87	.953
	Does the restaurant need to adopt the correct SOP?	3.80	1.011
	Students need to practice the 3 W practices implemented by the government.	3.84	.896
	Cleanliness in the restaurant is the responsibility of the restaurant owner.	4.27	.791

The table above shows Descriptive Analysis for Independent Variable, Time Saving. It shows that the mean score of six items starts from 3.5 to 3.7. The highest mean goes to number five item which is students can enjoy more leisure time if they choose to order fast food and enjoy that time at 3.77 (SD=.993) followed by the last item that is the students were seen to have a good rest time after getting tired of doing homework when they ordered fast food rather than choosing to cook on their own at 3.69 (SD=.874) for mean. While the lowest mean goes to the

number three item, students prefer to order fast food to save time and use that time to study the lesson more focused at 3.51 (SD=.991).

The table above shows Descriptive Analysis for Independent Variable, Convenience. It shows that the mean score of six items starts from 3.7 to 3.9. The highest mean go to the number three item, which is at the restaurant follows the SOPs set by the government 3.92 (SD=1.739) followed by the first item that is the students were seen to have a good rest time after getting tired of doing homework when they ordered fast food rather than choosing to cook on their own at 3.86 (SD=.968) for mean. While the lowest mean goes to the number five item, which is providing more than one hand wash and providing soap and tissues at 3.75 (SD=1.007).

The table above shows Descriptive Analysis for Independent Variable, Cleanliness. It shows that the mean score of six items starts from 3.8 to 3.42. The highest mean goes to last item which is cleanliness in the restaurant is the responsibility of the restaurant owner at 4.27(SD=.791) followed by the first item that is the students were seen to have a good rest time after getting tired of doing homework when they ordered fast food rather than choosing to cook on their own at 3.98 (SD=.976) for mean. While the lowest mean goes to the number four item, the restaurant needs to adopt the correct SOP at 3.80 (SD=1.011).

Reliability Analysis

Table 3 below shows the Reliability Analysis.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Time Saving	6	0.805
Convenience	6	0.746
Cleanliness	6	0.808
Factor That Influences University Students to Dine in at Restaurant During Covid 19 Recovery Period	6	0.824

Table show the reliability of the four factors influencing university students to dine in at a restaurant during the Covid 19 recovery period. The reliability of Cronbach's alpha value for convenience is 0.746, which indicates well. While the factor that influences university students to dine in at restaurants during Covid 19 recovery period was scored highest, which is 0. 824. For time-saving, 0.805 indicates well. However, cleanliness was 0.808.

Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported / Not Supported)
H_1 There is a significant relationship between time saving and factors that influence university students to dine in at restaurant during covid 19 recovery period	r=0.805, p < 0.01	H_1 is supported.
H_2 There is a significant relationship between convenience and factors that influence university students to dine in at restaurant during covid 19 recovery period	r=0.746, p < 0.01	H_2 is supported.
H_3 There is a significant relationship between cleanliness and factors that influence university	r=0.808, p < 0.01	H_3 is supported.

Time-saving have a high positive relationship with factors that influence university students to dine in at restaurant during covid 19 recovery period. According to Hypothesis 1 (H1). The communication skills had a Pearson Correlation Coefficient of 0.805, p = 0.01, according to the results provided in Table 4.15. Time-saving are strongly related to factors that influence university students to dine in at restaurant during covid 19 recovery period.

Convenience with the factors that influence university students to dine in at restaurant during covid 19 recovery period. According Hypothesis 2 (H2), convenience with the factors that influence university students to dine in at restaurant during covid 19 recovery period have a strong relationship. The entertainment had a Pearson Correlation Coefficient of r = 0. 746, p = 0.01, as shown in Table 4.15.

Cleanliness was predicted to have a strong positive relationship with factors influencing university students to dine in at a restaurant during the covid 19 recovery period in Hypothesis 3 (H3). According to the statistics given in Table 4.15, cleanliness has a Pearson Correlation Coefficient of r = 0.808, p = 0.01.

DISCUSSION AND RECOMMENDATION

This study shows the reasons that can influence students to return to eating in restaurants after covid 19. This is because all citizens worldwide are prohibited from eating in restaurants until the government allows it (Yulita P, 2020). Students have not eaten at the restaurant for a long time and want the restaurant to reopen. This study suggests creating causes and benefits when restaurants reopen for students and other customers. Thus, studies show many benefits of restaurants reopening, and many students agree with the reasons given.

CONCLUSION

In conclusion, we have studied the factors influencing university students to dine in restaurants after covid 19. In addition, the research questions also show the importance of restaurant cleanliness and how restaurants impact students.

As stated in this research, discussions are dedicated at responding to questions and addressing hypotheses. this research investigates factors that influence university students to dine at a restaurant during the covid 19 recovery period. the latest research would offer numerous recommendations for university students and future researchers based on the study's findings, allowing hospitality employees to reach their full potential toward customers. independent variables of correlation were represented (0.805> 0.746> 0.808).

ABSTRACT

E-learning is widely used as an educational approach around the globe, specifically during the COVID-19 pandemic. Rapid technology advancements and widespread Internet access enabled this approach's growth. This research aimed to determine the significant impacts of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic. Thus, this study empirically measures the extent of a lack of motivation, mental health, and procrastination behaviour on the academic performance of university students. This study was structured through a self-administered survey with university students in Malaysia who were identified and chosen for data collection. With 384 respondents, the data were analysed by descriptive, frequency, and inferential analysis using SPSS. These findings show that e-learning has the most significant impact on the academic performance of university students in Malaysia during the COVID-19 pandemic.

Keywords: Lack of motivation, Mental Health, Procrastination Behaviour, Academic Performance, E-learning

INTRODUCTION

COVID-19 is a newly discovered coronavirus that produces a contagious sickness. Previously, this illness was known as the '2019 novel coronavirus'. COVID-19 was initially detected in December 2019 in Wuhan, China. Malaysia proclaimed its first-ever verified case on January 25th, 2020, and confirmed the death on March 17, 2020, after being initially recorded in China in December 2019. This was just a day before the country issued a strict Movement Restrictions Order (MRO). Malaysians underwent changes during this period in response to COVID-19, including reforms to the education system.

Most university students were ordered to quit their dormitories and residence halls immediately, in many cases without their belongings, and were expected to finish their academic work on the digital platform. These immediate closures prevent students from interacting with one another and thereby decrease the number of cases (Bayham & Fenichel, 2020). The unexpected school and university closures as a consequence of the advent of COVID-19 have caused university officials to make changes in utilizing alternatives to traditional learning practices in times of emergency to safeguard the safety of students still not abandoned without education as to limit the growth of the pandemic. University closure gives significant changes to an educational system where students who used face-to-face classes are forced to use e-learning. This has a significant influence on the academic performance of students as well.

As a result, the researchers need to explore how well this learning system is being received by students and the primary challenges they face when e-learning that impacts their academic performance. This information will assist educational instructors and facilitators, and college and university administrations in determining the modifications that can be made to improve the effectiveness of e-learning so that it can eventually be integrated alongside classroom instruction. The study aims to investigate the impact of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic. There were three objectives of this research

1. To identify the relationship between lack of motivation and academic performance of university students in Malaysia during the COVID-19 pandemic.

2. To examine the relationship between mental health and academic performance of university students in Malaysia during the COVID-19 pandemic.

3. To determine the relationship between procrastination behaviour and academic performance of university students in Malaysia during the COVID-19 pandemic.

Significant of The Study

The significance of this study is about the impact of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic. This study can help the reader understand more about the impact of e-learning students' appearance, which affects their academic performance in this country. The researchers also can know the perception and experiences of students and lecturers. Besides that, this research can inform readers about the implications of e-learning that affect their student's academic performance. Based on this research, the readers do not efficiently judge students that say e-learning is more accessible than physical learning. Students lack social support from their friends during the online learning because they are too busy to complete their assignments (Irawan, Dwisona & Lestari, 2020). This research would help more people to understand the impact of e-learning. Last but not least, this research would reference the readers in investigating the impact of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic and explore more details because this topic is a perfect topic to learn.

LITERATURE REVIEW

E-Learning

Covid-19 has affected education all over the world. Universities and schools remained closed (Murphy, 2020). Consequently, the upsurge of e-learning is happening in the education system (Bozkurt et al., 2020). Though online learning helps to teach or learn during the pandemic period, implementing a planned and structured online learning system is essential to have a successful e-learning system. E-learning has developed into a critical component in reforming the traditional educational system.

E-learning or electronic learning delivers learning and training by utilizing online technologies. -learning enables users to study whenever and wherever they choose, with few constraints. E-learning delivers training, education, or information online through a computer or other digital device. Besides that, e-learning has crossed classroom boundaries and ensures that learning is always available. The platform of e-learning is suitable for university students as it facilitates student engagement (Alom et al., 2019; Hussain et al., 2018). Nevertheless, there are some difficulties for the student because they may lack understanding of the contents or lesson in the class.

Lack of Motivation during E-Learning on Academic Performance

Motivation is defined as how humans initiate and maintain purposeful behaviour. Motivation is often understood as the procedure through which an individual's wants and goals are triggered (Alexander & Murphy, 1998; Pintrich, Marx, & Boyle, 1993). The primary obstacles to e-learning include the loss of social interaction, administrative and teacher difficulties, time and support, and learner motivation during the COVID-19 pandemic (Agbejule, Ndzibah, Lotchi, 2021). Because of the large number of tasks they get each day, most students suffer from a lack of motivation. A loss of desire impacts students' academic performance because they lose their incentive to study via e-learning. The research found that students who lack motivation during this pandemic are strongly impacted by external circumstances (Cahyani, Listiana, & Larasati (2020), Rachmat (2020), Simamora (2020).

Consequently, students who have poor self-motivation or planning skills may struggle to keep up with consistent deadlines while pursuing their virtual courses that greatly impact

their academic performance. They have poor self-efficacy and a sense of incapacity since learning will not result in the intended goal and activities will also have no worth (Harnet, 2016). Due to a significant lack of motivation, they are less likely to participate in e-learning sessions with lecturers and get worse scores on their examinations, which impact the students' academic performance.

Mental Health during E-Learning on Academic Performance

The lockdown suddenly changed the population's routines and freedom of mobility. As a result, mental health issues such as worry, fear, depressive symptoms, loneliness, and insomnia have developed to some extent. This e-learning arrangement has a lousy influence on students' mental health. The speedy worldwide increase of infected cases has created a way of uncertainty and anxiety concerning what is about to happen. It has also caused an extraordinary stress among the university, like mental health, including scholars. Stress is now a significant cause of the impact on the academic performance of university students during this pandemic.

Students' multiplicity of mental health issues presents a challenge within a university community and necessitates an appropriate response (Rana, Smith, & Wlaking, 1999; Stanley & Manthorpe, 2002). This fast growth on a massive scale has impacted students of all ages (Hasan and Bao, 2020). The high levels of mental health symptoms seen in students seemed to have been encouraged by the uncertainty and the possible adverse effect on academic achievement during e-learning classes (Giusti et al., 2021). Continued disease transmission, travel restrictions, and the closing of educational institutions throughout the country are expected to significantly affect students' education, social life, and mental health (Odriozola-gonzalez et al., 2020). For others, the effects of pandemics and e-learning could trigger new mental health and mood changes which cause students to get low grades in student academic performance.

Procrastination Behaviour during E-Learning on Academic Performance

Procrastination behaviour has been connected to ineffective learning practices and the student's academic performance. Procrastination is characterized as a self-defeating behaviour pattern with short-term and long-term benefits. Academic procrastination is a severe barrier that inhibits students from succeeding in school since putting off studying the numerous subjects required to satisfy the academic requirements negatively impacts mastering the various educational levels and academic performance. For many students, academic procrastination is related to problematic learning outcomes such as poor academic performance, lousy quality of academic work, lack of knowledge, time pressure, dropout and more prolonged course of study. As a result, a significant focus of this research is on the role of academic procrastination during the lockdown (Yilmaz, 2017).

Several studies have shown that procrastinating negatively impacts learning, course attitude, and academic performance (Hayat, Jahanian, Bazrafcan, & Shokrpour, 2020). Furthermore, low or high self-esteem influences academic procrastination during e-learning. As a result, student's students' procrastination behaviour causes academic failure (Editor et al., 2020). Other research has revealed that students who put off working on assignments are more likely to perform poorly. These findings support the harmful effects of procrastination and the value of consistent learning habits (Park et al., 2018).

E-Learning on Academic Performance of University Students in Malaysia during Covid-19 Pandemic

Academic performance is a measure of a student's accomplishment in a variety of academic subjects. e-learning affects psychological students. Research suggests that academic performance, as measured by student performance, has declined among sure students following the outbreak of the COVID-19 pandemic, where the students were enrolled in e-learning. This pandemic increased the risk of viral infection-related mortality and psychological distress for individuals worldwide (Xiao et al., 2020). The most psychological impact that cases stated for

the student is anxiety. As a subgroup of psychological consequences, anxious well-being has received less attention, despite being just as prevalent and perhaps as severe as depression (Sundaresen et al., 2020). COVID-19 and lockdowns for college students in China have been linked to severe negative consequences on students' psychological well-being and elevated levels of worry (Sundarasen et al., 2020). Besides that, the impacts of e-learning are that many works and assignments are given to students, and there are no flexible deadlines. This impact can affect the student's academic performance because the works need to be submitted simultaneously, and no excuses even have a technical issues, for example, slow internet connections. Students' inability to motivate themselves physically results in low academic performance. The careless attitude of students is also the impact of e-learning on academic performance during the pandemic.

Research Hypothesis

The literature review highlighted that the independent variables such as lack of motivation, mental health and procrastination behaviour do impact the academic performance of university students in Malaysia during the COVID-19 pandemic. The hypothesis in the study is to find out whether there are any correlations or relationships between dependent variables and independent variables:

H_1 There is a significant relationship between the lack of motivation and the academic performance of university students in Malaysia during the COVID-19 pandemic.

H_2 There is a significant relationship between mental health and academic performance of university students in Malaysia during the COVID-19 pandemic.

H_3 There is a significant relationship between procrastination behaviour and the academic performance of university students in Malaysia during the COVID-19 pandemic.

Research Framework

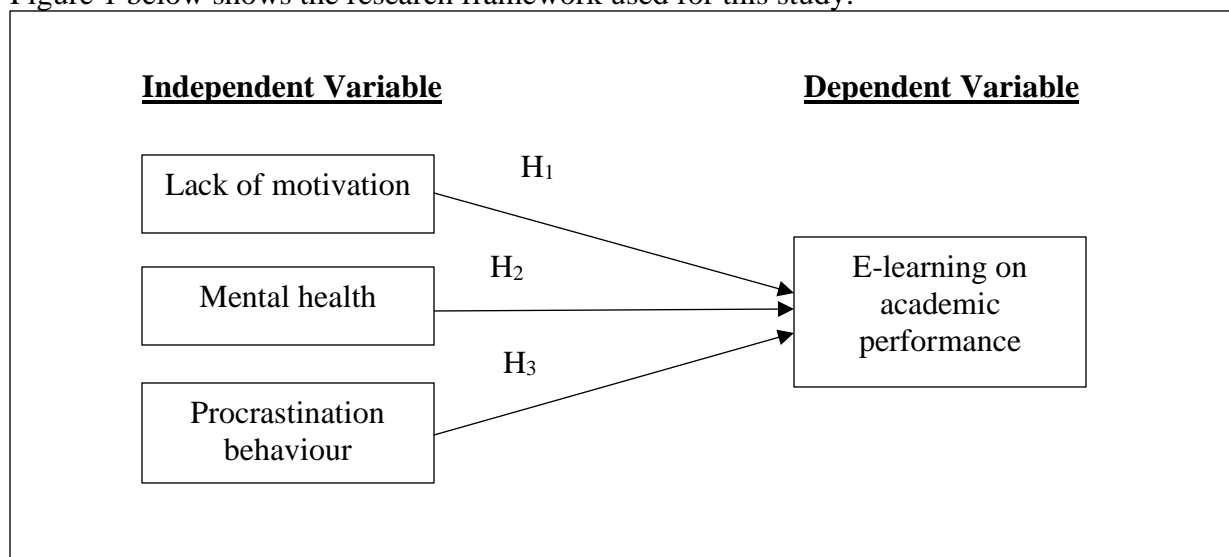
Figure 1 below shows the research framework used for this study.


Figure 8 Research Framework

METHODOLOGY

Research Design

This research applies a quantitative method. This research used a questionnaire to conduct the survey. Quantitative research design is used when statistical findings require actionable insights. The survey sample conducted on university students aged 18 and above years old. Students chosen for this survey answered how their e-learning classes were during the pandemic. Quantitative and descriptive methodologies were used to conduct the study, with questionnaires as the study tool. The questionnaire elicits all the information pertinent to the

study's aims. The questionnaire includes a section on demographics with multiple-choice options. The questionnaire was divided into five sections. The student's survey has items assessing five sections: demographic background, a questionnaire on lack of motivation during e-learning, a questionnaire on procrastination behaviour during e-learning, a questionnaire on e-learning's impact on student's mental health; and a dependent variable on the impact of e-learning on academic performance during COVID-19 pandemic among university students in Malaysia. The Likert Scale was used to determine the impact of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic.

Data Collection

This research used the survey method, and the tools were questionnaires. Questionnaires used Google Forms and were sent to the respondents through social media such as WhatsApp and Telegram. The survey for the respondents is conducted online due to Standard Operation Procedure (SOP) and limited physical activity. The questionnaire is designed to collect data about students' lack of motivation, mental health, and procrastination towards the impact of e-learning on academic performance among university students during COVID-19 pandemic.

Sampling

A non-probability sampling technique was chosen as a convenience sampling technique. Convenience sampling is perhaps the easiest method because participants are selected based on availability and willingness to participate. The researchers chose respondents for samples based on demographic information, including age, gender, race, year of education, education level, and student status. Based on Krejcie & Morgan (1970), the appropriate number derived from 135,572 students is 384.

Table 37: Categories of Student Education Level

Level of Education	Total Students
Diploma	47,445
Bachelor's	71,396
Master	11,685
PhD	5,046
Sum	135,572

Source: Ministry of Higher Education, 2020

Data Analysis

Data analysis is the method of examining, cleaning, manipulating, and modelling data to extract critical information, assist in decision-making, and provide recommendations (Pal, 2017). The survey data distributed to respondents was compiled using the Statistical Package for Social Sciences (SPSS) software version 26.0. SPSS is a program-based window for data entry and analysis that allows us to construct tables and pie charts. In this study, the researchers applied the SPSS version to check the statistical data analysis. The analysis used in this study is frequency analysis, descriptive analysis, reliability analysis, and correlation analysis.

FINDINGS

Result of Frequency Analysis

Table 2 below shows the results of frequency analysis.

Table 38: Frequency Analysis

Characteristics	Frequency	Percentage
Gender	171	44.5
Male	213	55.5
Female		

Age		
18-20	85	22.1
21-23	171	44.5
24 and above	128	33.3
Race		
Malay	189	49.2
Chinese	92	24.0
Indian	85	22.1
Others	18	4.7
Education Level		
Diploma	92	24.0
Bachelor	161	41.9
Master	73	19.0
PhD	58	15.1
Year of Education		
1	79	20.6
2	114	29.7
3	162	42.2
4	29	7.6
Student Status		
Full Time Student	310	80.7
Part Time Student	62	16.1
Other	12	3.1

Table 2 below shows the frequency analysis results for the gender, age, race, educational level, year of education and student status distribution of 384 respondents. The table above clearly indicates that female respondents were 55.5% (n=213) more than male respondents, at 44.5% (n=171). Next, among these three age groups, the highest number of respondents was from 21 to 23 years old, with a rate of 44.54% (n=171). The age group of 24–34 years old had the second highest number of respondents (n=128), with 33.3 per cent (n=128). At the same time, the age group of 18 to 20 years old had the lowest number of respondents, 22.1% (n=85). According to the survey, the majority of the respondents involved in this questionnaire were Malay, consisting of 49.2% (n=189). The second highest was Chinese, which comprised 24.0% (N = 92). The remaining respondents were Indian and other races, which consists of 22.1% (n=85) and 4.7% (n=18), respectively. The result indicated that most respondents were from bachelor's degree level, consisting of 41.9% (n=161) out of a total of 384 respondents. Followed by the Diploma level of education consists of 24% (n=92). While, 19.0% (n=73) fall under the education level group Master. The lowest number of respondents were from the education level group PhD with 15.1% (n=58). The table above shows that 3rd year students have the largest percentage with 42.2% (n=162) compared to 4th year students, which is the lowest with 7.6% (n=29). Lastly, most of the respondents involved in this questionnaire were full time students, consisting of 80.7% (n=310). While the second highest is part-time students, which was 16.1% (n=62). While the lowest number of respondents for student status is other, which consists of 3.1% (n=12).

Result of Descriptive Analysis

Table 3 below shows the results of the descriptive analysis.

Table 39: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Lack of Motivation	I am interested in learning if e-learning becomes the new approach to learning.	2.73	1.022
	E-Learning increases my motivation to study.	2.77	1.099
	E-Learning has the potential to boost my creativity.	2.85	1.131
	E-learning enables me to complete tasks quickly.	2.63	1.067
	My lack of motivation affects my academic performance.	3.37	1.093
	I am able to attend all the e-learning classes.	2.91	1.169
Mental Health	I'm always concerned about my health.	3.74	0.860
	I'm having difficulty concentrating in my e-learning classes.	3.51	0.873
	I'm having trouble with my sleeping patterns.	2.66	1.201
	My mental health issues have a negative impact on my academic achievement.	3.91	0.759
	I'm experiencing stress during e-learning.	3.94	0.859
	My increasing class workload affects my mental health.	3.71	0.954
Procrastination Behaviour	Procrastination will occur when I am writing a term or research paper.	3.94	0.859
	I'm usually procrastinating on studying for an exam.	3.86	0.929
	I can keep up with weekly reading assignments.	2.66	1.201
	I can perform administrative tasks on time.	2.74	1.133
	I'm capable of attending meetings without procrastinating.	2.73	1.022
	I can perform academic tasks in general.	2.72	1.193
E-Learning on Academic Performance	E-learning is more successful than traditional classroom instruction.	2.78	1.158
	E-learning is more convenient than face-to-face classes.	2.81	1.101
	I feel that e-learning content enables me to work together with my peers.	2.80	1.097
	It's challenging to keep students engaged in e-learning.	3.91	0.759
	My lack of computer abilities makes it difficult for me to successfully use e-learning.	3.71	0.945
	My poor academic performance is an outcome of the negative impact of e-learning.	3.74	0.860

Table 3 shows the mean and standard deviation for the items used to measure the lack of motivation, mental health, procrastination behaviour and e-learning on academic performance. There were six (6) questions measured for all the variables. For variable lack of motivation had the highest mean, 3.37, on the statement "My lack of motivation affects my academic

performance". However, it was measured with the lowest mean of 2.63, on the statement "E-learning enables me to complete tasks quickly". For variable mental health had the highest mean, 3.94 on the statement "I'm experiencing stress during e-learning". However, it was measured with the lowest mean of 2.66, on the statement "I'm having trouble with my sleeping patterns" statement. For variable procrastination, behaviour had the highest mean, 3.94 on the statement "Procrastination will occur when I am writing a term or research paper".

Meanwhile, it was measured with the lowest mean of 2.66 on the statement "I can keep up with weekly reading assignments" statement. For variable e-learning on academic performance had the highest mean, 3.91 on the statement "It's challenging to keep students engaged in e-learning". Meanwhile, it was measured with the lowest mean of 2.78 on the statement "I can keep up with weekly reading assignments" statement.

Result of Reliability Analysis

Table 4 below shows the result of the reliability analysis.

Table 40: Reliability Analysis

Variables	Number of Items	Cronbach's Alpha
Lack of Motivation	6	0.774
Mental Health	6	0.880
Procrastination Behaviour	6	0.706
E-Learning on Academic Performance	6	0.709

According to Table 4 above, the results for the pilot test for each section of the questionnaire are acceptable because all the values are more than 0.700 Cronbach's Alpha. In this study, there six questions were used to measure the variables. The first independence variable, which lacks motivation, is 0.774, resulting in good association strength. The second independence variable, mental health, is 0.880, resulting in a very good strength of association. Next, procrastination behaviour is 0.706, which is a good strength of association. Last ,the dependent variable which, e-learning on academic performance, is 0.709, which resulted in a good strength of association and all the variables had valid questions.

Result of Pearson Correlation Analysis

Table 5 below shows the Pearson Correlation Analysis.

Table 41: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H_1: There is a significant relationship between lack of motivation and academic performance of university students in Malaysia during COVID-19 pandemic.	0.516	H_1 is supported
H_2: There is a significant relationship between mental health and academic performance of university students in Malaysia during COVID-19 pandemic.	0.54	H_2 is supported
H_3: There is a significant relationship between Procrastination Behaviour and academic performance of university students in Malaysia during COVID-19 pandemic.	0.517	H_3 is supported

As seen from Table 5, the results of hypothesis testing are reported based on a significant relationship between the lack of motivation, mental health and procrastination behaviour in the academic performance of university students in e-learning classes. Overall, these results indicate that all the hypotheses were accepted at a 0.01 significance level.

DISCUSSION AND RECOMMENDATION

In general, this study has extensively researched the impact of e-learning among university students during covid-19 in Malaysia. Discussions are targeted at solving questions and addressing hypotheses as mentioned in the first chapter of this study. Based on the study's findings, the researcher would provide a theoretical, methodological, and practical recommendation that can be made in the future study. Future research should utilize other independent variables, such as the student's attitudes, because the findings revealed that students' attitudes about e-learning changed from the beginning to the end of the class. It may have an impact on their academic performance.

The researcher also suggests utilizing a quantitative method for any research on this topic because it can obtain data much faster than a qualitative method. The data collection toolkit of a qualitative researcher is quite diverse, ranging from entirely unstructured for semi-structured techniques. Because the data is numeric, statistical tests can be used to make statements about the data using the quantitative method. Researchers can generate an impact that e-learning has on student academic performance during e-learning that is greater than the researcher's initial study. Future study should use students with practical skills to discover more about their perceptions of the impact of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic. They may also assist the researchers in discovering the problems they encountered during practical sessions. Future researchers also might concentrate this study on all public and private universities in Malaysia.

CONCLUSION

The purpose of this study is to determine the impact of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic. This study aims to ascertain the impacts of e-learning in terms of lack of motivation, mental health and procrastination behaviour. Additionally, the study discovered that the impacts of e-learning had an impact on the academic performance of university students. Additionally, the research includes three independent variables: a lack of motivation, mental health, and procrastination behaviour.

Pearson Correlation analysis is used to determine the relationship between independent and dependent variables. This demonstrates how the independent variables affect the dependent variable. The researcher has seen that the three independent variables, which are lack of motivation, mental health, and procrastinating behaviour, which have a significant relationship with e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic. In conclusion, this study proves that the independent variables, namely Lack of Motivation, Mental Health and Procrastination Behaviour, have a moderate positive correlation with the academic performance of university students in Malaysia during the COVID-19 pandemic. The results of the data indicate that lack of motivation, mental health, and procrastinating behaviour is a significant impact of e-learning on the academic performance of university students in Malaysia during the COVID-19 pandemic.

ABSTRACT

Many university students reported changes in the foods they ate, how much they ate, and how often they snacked because most students have returned to their families, with many taking on passive roles in activities that shape their eating behaviours during COVID-19. Therefore, this study empirically measures how parental influences, food prices, and academic stress influence eating behaviour among university students during the COVID-19 pandemic. The data for the study was collected through a survey with 384 respondents, all of which were recognized, university students. Data were analysed by frequency analysis, descriptive analysis, reliability analysis, and Pearson correlation analysis through SPSS version 26.0. The results of the Pearson correlation demonstrate a link between parental influence, food prices, academic stress, and eating behaviour. The findings indicated that the food price factor influenced university students' eating behaviours during the COVID-19 pandemic in Malaysia. These findings have implications for future policies and approaches for assessing nutrition in crises like the COVID-19 pandemic.

Keywords: Eating Behaviour, Parental Influence, Food Price, Academic Stress,

INTRODUCTION

The emergence of COVID-19 has led to severe changes worldwide from the end of 2019 to the present day. The Malaysian government has taken precautionary measures in response to the COVID-19 pandemic by creating a Movement Control Order [MCO] on 18 March 2020. It has affected the lives of university students throughout Malaysia. All educational institutions in Malaysia have also been closed by the government (Shah et al., 2020), and it is forcing university students in Malaysia to adjust their daily lives and eating behaviours. The closure of the university campus coincided with the introduction of the stay at the home limit. Also, it caused the Malaysian education system to shift from face-to-face teaching to online learning. In this regard, the routines of university students in terms of daily activities and eating behaviour have changed or will change (A. Radwan & E. Radwan, 2020). According to Owens et al. (2020), this situation is further compounded by the pandemic implications of COVID-19, which found that 34.5% of university students claimed that their eating behaviours had changed.

Parental food choice motives were associated with variations and alterations in nutritional quality during closure (Marty et al., 2021). According to Pung et al., (2021) many university students are obliged to eat all of their food at home. As a result, parents are in charge of their children's eating behaviours throughout the day (A. Radwan et al., 2021). Philippe et al. (2021) suggest that parents encourage healthy eating by offering advice on food selection and consumption of home-cooked foods to avoid contamination.

Meanwhile, according to A. Radwan et al. (2021), their parents are impoverished and have lost their source of income since the present lockdown, so they have no option but to supply for their needs, which they do by purchasing the cheapest food products. University students from medium or low-income socioeconomic families with less money and poor living conditions are more likely to experience changes in eating behaviours and have higher levels of nutrition-related disease (French et al., 2015). Apart from that, the university may be a source of substantial stress for many students during this pandemic. Since the university's closure, it

has reinforced remote and online learning to prevent the increasingly massive spread of the COVID-19 virus (Mesa et al., 2021). University students are involved with stress because they have to learn with new learning methods. According to Choi (2020); Pung et al. (2021), distance learning at home increases the higher stress level and affects health behaviours, including eating behaviours.

Therefore, this study examines the factors that influence eating behaviours among university students in Malaysia during COVID-19. This study focuses on three aspects of the factors that influence eating behaviours: parental influence, food price, and academic stress. There were three objectives of this research:

1. To identify the relationship between parental influence and eating behaviours among university students during the COVID-19 pandemic in Malaysia.
2. To examine the relationship between food price and eating behaviours among university students during the COVID-19 pandemic in Malaysia.
3. To determine the relationship between academic stress and eating behaviours among university students during the COVID-19 pandemic in Malaysia.

Significance of the Study

Future Researcher

This research may be used as a reference to determining the factors contributing to eating behaviours among university students. This means this research will be used by future researchers to do their research or to improve the quality of their research.

Industry Player

This research will also contribute to an industry that holds research to standards other than academic journals, primarily investment returns. Exposing students to this research process gave them a different perspective than just sharing journal concepts or working in academic journals. Even better, students are exposed to real-world environments and expectations through involvement in industry research.

Authorities

The Ministry of Education [MOE] and the Ministry of Health [MOH] can establish mechanisms to encourage more research and development in terms of eating behaviours through the Institutes, one of the inputs of information about students' eating behaviours, whether balanced or otherwise. This would be able to create a wellness program to practice healthy eating behaviours among university students during and post COVID-19.

LITERATURE REVIEW

Eating Behaviours During COVID-19 Pandemic

According to a recent study, eating behaviour among university students during abstinence at home can become healthy or poor (Alom et al., 2019; Ammar et al., 2020). When COVID-19, the closure of all economies, including restaurants, influenced many students to switch to homemade food because there was no other option (A. Radwan et al., 2021). According to Davitt et al. (2021), more than 50% of the surveyed university students eat meals with their families. In addition, the percentage of students eating fast food per week is much lower during COVID-19 than before this pandemic (A. Radwan et al., 2021). This could be due to the closure of restaurants and other establishments that serve fast food to students or fear of contracting COVID-19. Nevertheless, studies also show that fast food intake or processed foods also increase among university students during COVID-19 (Jalal et al., 2021) because restaurants provide online food delivery to customers during COVID-19.

A study published by Pung et al. (2021), among university students in Malaysia, revealed that 41.98% of the surveyed respondents had inconsistent eating patterns such as irregular meal intake and skipped meals during the COVID-19 pandemic by skipping breakfast,

lunch, or dinner. Moreover, Choi (2019) described the majority of university students ingested fruits and vegetables based on family suggestions. During the COVID-19, they eat fruits and vegetables to strengthen their immune systems (Aman & Masood, 2020). Meanwhile, according to Pung et al. (2021), Pung et al. (2021) said more than 90% of university students consumed snacks such as chocolate, chips, biscuits, and bread during the COVID-19. These studies showed that students who had higher levels of stress when learning online were more likely to participate in snacking.

Parental Influence

According to Philippe et al. (2021), parental eating behaviour had a massive influence on children's eating behaviour, which may have changed during closure to have a complete picture of COVID-19's pandemic impacts on the food domain. Some students may have returned to previous influences held in parenting by repeating behaviours and learning concepts that routines reflect the thoughts, behaviours and tastes contained by individuals as a result of the social structure in which they live (Jastran et al. al., 2009). During the COVID-19 period, students with highly educated parents had a more significant influence on food quality and quantity than during the previous period since they have a good understanding of food and nutrition, and they influence their children's eating behaviours and food consumption. As a result, they promote healthy eating through advising on food selection and self-cooked meal intake (Banna et al., 2015; Lehto et al., 2018).

The growing spread of the COVID-19 pandemic around the world also causes many of their parents to be more sensitive to their food safety to reduce the risk of infection. The parents are becoming increasingly hesitant to buy their food, necessitating the consumption of home-cooked meals as well as increased consumption of vegetables and fruits (Abd Rahman et al., 2021) to avoid contamination. According to Duda-Chodak et al. (2020), although food and water are not considered direct transmission paths for COVID-19, it is impossible to ignore the fact that the virus can survive for several days on various surfaces, particularly in environments with poor hygiene as well as contamination of animal's products consumed by humans, such as pigs and rabbits (Yekta et al., 2020).

Food Price

Food price was frequently identified as a crucial factor in determining and arbitrating eating behaviours among university students, especially regarding skipping meals. (Pung et al., 2021). Consumers will select the cheapest product over the healthier one. University students may substantially impact their life expectancy following the decline of family economic conditions during COVID-19, which was the worst before the COVID-19 pandemic (A. Radwan et al., 2021). According to A. Radwan & E. Radwan (2020), the majority of families report the loss of their incomes during this pandemic, and it influences students to buy and eat low-quality nutritious food more than those with middle and higher incomes during COVID-19. Most of them were aware of the importance of eating healthy food during COVID-19 to boost self-immunity (Abd Rahman 2020); such awareness will not be able to prevent or minimize the intake of unhealthy foods due to high food prices on healthy foods.

Meanwhile, some studies identify that increasing food prices influences university students to eat homemade food during this COVID-19 pandemic. According to Abd Rahman (2020), during COVID-19, households are frugal by cooking at home rather than purchasing food from a store, either online or in person. Several studies show rising prices of fresh goods, including fruits, vegetables, and raw materials (Mattioli et al., 2020), resulting in their parent's increase in frozen and canned ingredients, whether canned vegetables, fruits, or meat (A. Radwan et al., 2021). These studies suggest that since it contains a high salt, sugar or trans-fat, it tends to have a low price. However, according to Mills et al. (2017), when people prepare home-cooked foods, they are more likely to make healthier choices when they eat because they have more control over ingredients and portion sizes while cooking.

Academic Stress

Many students were stressed due to the sudden switch to online learning during COVID-19 where some students could not access instructional resources via digital platforms (Malik et al., 2021). During COVID-19, some studies have found that academically stressed students consume more unhealthy foods than non-stressed students (Choi, 2020; Pung et al., 2021), such as sweets and high-fat snacks (Papier et al., 2015; Aljaber et al., 2019). They eat more fat and calorie-dense meals because they stimulate serotonin in the brain, which is involved in mood regulation and pleasure experiences (Caso et al., 2020). Meanwhile, Choi (2020) states that stressed students would utilize food as a maladaptive coping mechanism to manage their stress.

Moreover, skipping meals is linked to stress and depression since a study suggests that skipping meals may be both a cause and an effect of stress (Yau & Potenza, 2013). According to Badrasawi et al. (2020), most university students lose track of their hunger and lack the motivation to eat properly. As noted by Schmader (2020), during online learning, students have started skipping meals to get more work done; the pressure of completing an assignment before the deadline adds to the already stressful time, which includes little or no eating time. This study revealed that university students are more concerned with finding out how to get excellent grades than with food quantity and quality.

Research Hypothesis

The study's hypothesis is to determine whether there are any relationships between dependent and independent variables. The hypothesis of the research is:

H_1 : There is a significant relationship between parental influence and eating behaviours among university students during COVID-19 in Malaysia.

H_2 : There is a significant relationship between food price and eating behaviours among university students during COVID-19 in Malaysia.

H_3 : There is a significant relationship between academic stress and eating behaviours among university students during COVID-19 in Malaysia.

Research Framework

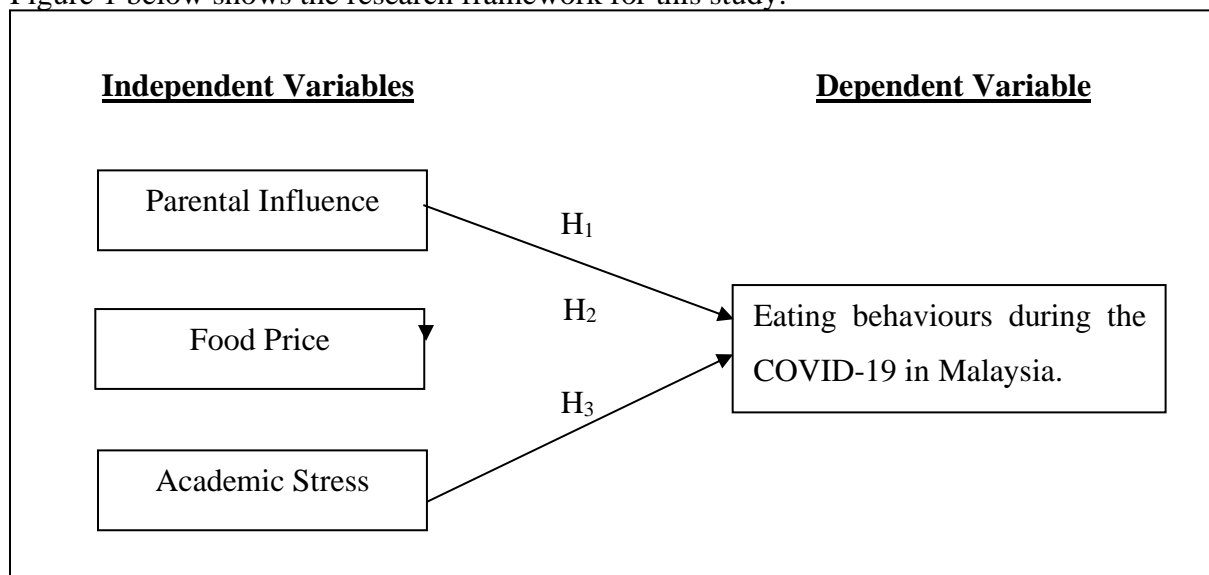
Figure 1 below shows the research framework for this study.


Figure 1: Research Framework

METHODOLOGY

Research Design

This research will use a quantitative approach. The survey for this research has conducted through a questionnaire. The sample chosen in this research consists of university students aged

471

19 and above. Students selected for this survey will answer questions about the eating behaviours of university students and the factors that influenced them during this pandemic. The questionnaire is designed to accumulate all information about the study's objective. The questionnaire will contain a demographic section with multiple choices. The respondents must choose the determinant choices. In parental influence, food price, and academic stress, the Likert scale will be applied to determine the factors influencing eating behaviours among university students during this pandemic. The choice is between 1, which strongly disagrees to 5, which is strongly agreed. All the data analysis uses the latest version of Statistical Package Social Science [SPSS].

Data Collection

The data obtained by the researcher through questionnaires for a project from first-hand sources or for particular research purposes through various sources such as experiments, interviews, surveys, and so on is referred to as primary data. A Google form was used to create a questionnaire to collect data. The questionnaire is being used to collect information about the factors influencing eating behaviours among university students in Malaysia during the COVID-19 pandemic. It will be disseminated online owing to a problem with an infectious disease that has afflicted the country, COVID-19.

Sampling

A non-probability convenience sampling method will be chosen as the sampling method. The questionnaires were prepared and distributed online and on social media to gather information from the respondents. The respondents of the questionnaire are university students. Hence, respondents were randomly selected from various universities in Malaysia as any person could answer the given questionnaire and data will be collected based on their answers through online and social media.

In achieving a valid sample for this study, Table 1 shows Malaysia's total population of university students. Due to the large number of students, the study sums up the number of students which is 1,507,068 students. Therefore, using the Krejcie and Morgan table, the total sample size that will be used is 384 people, representing the total population of university students in Malaysia.

Table 1: The Population of University Students in Malaysia

Level of Education	Total Students
Diploma	526,655
Bachelor's Degree	812,520
Master	110,141
PhD.	57,752
Sum	1,507,068

Source: Ministry of Higher Education, 2020

Data Analysis

The data will be evaluated using the SPSS in this study. The researcher obtains data for this study's data analysis and does frequency analysis, descriptive analysis, reliability analysis and Pearson correlation analysis.

FINDINGS

Result of Frequency Analysis

Table 2 below shows the result of the frequency analysis

Table 2: Frequency Analysis

Characteristics	Number of Respondent (N)	Percentage (%)
Gender		
Male	129	33.6

Female	225	66.4	

Age		
19 – 21 years old	116	30.2
22 – 24 years old	185	48.2
25 – 27 years old	34	8.9
28 – 30 years old	28	7.3
31 years old and-above	21	5.5
Educational Level		
Diploma	97	25.3
Bachelor	225	58.6
Master	33	8.6
PhD	29	7.6
Marital Status		
Single	351	91.4
Married	33	8.6
Other	-	-
Race		
Malay	236	61.5
Chinese	41	10.7
Indian	57	14.8
Other	50	13.0

Based on the gender of the respondents, this study involved 384 respondents from university students in Malaysia. 384 respondents consisted of 33.6% males and 66.4% females. Table 2 shows the demographics of the respondents. It shows that the total number of female respondents is more than male respondents. Based on age, 30.2% of them are between 19 - 21 years, 48.2% are those aged 22 - 24 years, and 8.9% are aged 25 - 27. Respondents aged 28 - 30 years and 31 years and above were 7.3% and 5.5% respectively. Based on the respondents' level of education, the highest number collected in this section is 58.6% Bachelor's students. Followed by Diploma with 25.3%, Masters category with 8.6% and 7.6% were those of PhD students. Based on marital status, 91.4% were single, and 8.6% were married. Based on race, 61.5% are Malay compared to Chinese and Indians are 10.7% and 14.8%. At the same time, the respondents for other races are 13.0%.

Result of Descriptive Analysis

Table 3 below shows the result of the descriptive analysis.

Table 3: Descriptive Analysis

Variables	Items	Mean Score.	Standard Deviation
Parental Influence	I would eat whatever food my parent prepared during the MCO.	4.47	0.861
	My parents eat more fruits on their daily menu.	3.18	1.211
	My parents prepared healthy meals during MCO.	3.96	0.923
	My parents prepared to cook at home to ensure cleanliness.	4.51	0.723
	My parents encouraged me to take vegetables to prevent COVID-19.	3.70	1.094
Food Price	The main reason for choosing food it's low price.	4.41	0.868
	I choose cheap food even though they are not nutritious.	3.83	1.143
	I cook at home during MCO because it saves money.	4.28	0.868

	I do not consume healthy food since it is expensive.		3.54	1.180
	I eat according to my needs or affordability.		4.35	0.836
Academic Stress	When I am stressed, my eating behaviour is disrupted.		4.23	0.910
	I have the urge to eat when upset.		3.93	0.964
	I think snacking is responsible for the sensation of pleasure.		3.45	1.212
	I will eat too much to relieve my stress.		3.73	1.043
	Stress caused me to skip meals for focusing on my learning.		4.22	0.982
Eating Behaviours	Do you always skip meals during online learning?		4.44	0.815
	Do you prefer to order fast food during MCO?		3.93	1.067
	Do you enjoy eating snacks during COVID-19?		3.99	1.063
	Do you consume more fruits and vegetables?		3.67	1.109
	Do you eat homemade food during COVID-19?		4.35	0.863

Table 3 shows the mean and standard deviation for five statements under three independent and dependent variables based on the survey involving 384 respondents. The statement "My parents cook at home to ensure cleanliness" has the highest mean value of 4.51 and standard deviation value of 0.723. in the parental influence factor, the statement "My parents eat more fruits on their daily menu" has the lowest mean value of 3.18 and standard deviation value of 1.211. As for the factor of food price, the statement "The main reason for choosing food is it's a low price." has the highest mean value of 4.41 and standard deviation value of 0.868, while the statement "I do not consume healthy food since it is expensive has the lowest mean value of 3.54 and standard deviation value of 1.180. Furthermore, the highest mean value for academic stress factors is the statement "When I am stressed, my eating behaviour is disrupted." with 4.23 and a standard deviation value of 0.910. The lowest mean value is "I think snacking is responsible for the sensation of pleasure." with 3.45 and a standard deviation value of 1.212. The statement "Do you always skip meals during online learning?" has the highest mean value of 4.44 in the dependent variable of eating behaviour and a standard deviation value of 0. 815, while the statement "Do you consume more fruits and vegetables?" has the lowest mean value of 3.67 and standard deviation value of 1.109.

Result of Reliability Analysis

Table 4 below shows the result of the reliability analysis.

Table 4: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Parental Influence	5	0.813
Food Price	5	0.799
Academic Stress	5	0.704
Eating Behaviours	5	0.757

Table 3 shows that Cronbach's alpha coefficient of parental influence is 0.813, food price is 0.799, academic stress is 0.704 and eating behaviours is 0.757, resulting in a good strength of association. Thus, the coefficient obtained for the questions of the independent and dependent variables is valid. A variable is said to be reliable if the value Cronbach Alpha > 0.60.

Result of Pearson Correlation Analysis

Table 5 shows the result of the Pearson correlation analysis.

Table 5: Pearson Correlation Analysis

Hypothesis	P-Value	Result

H$_1$: There is a significant relationship between parental influence and eating behaviours among university students during the COVID-19 pandemic in Malaysia.	0.442	H$_1$ is supported
H$_2$: There is a significant relationship between the food price and eating behaviours among university students during the COVID-19 pandemic in Malaysia.	0.747	H$_2$ is supported
H$_3$: There is a significant relationship between academic stress and eating behaviours among university students during the COVID-19 pandemic in Malaysia.	0.608	H$_3$ is supported

The result in table 5 shows the food price and eating behaviour at 0.747, indicating a high positive coefficient. Following academic stress and eating behaviour showed 0.608, indicating a moderate positive coefficient. Meanwhile, parental influence and eating behaviour showed 0.442, indicating a moderate positive coefficient. All three variables positively correlated to eating behaviour and were statistically significant, $p < 0.01$. Therefore, all hypotheses in this study are supported by the results

DISCUSSION AND RECOMMENDATION

The present study shows similarities with past research. Philippe et al. (2021) indicate that parental influence can cause university students to decide to follow their parents' eating behaviours. For example, parents will recommend their children to eat at home or cook rather than eat at a restaurant, as well as increase their intake of vegetables and fruits to avoid being infected with COVID-19. Meanwhile, Abd. Rahman (2020) indicates that the COVID-19 pandemic has changed people's perceptions to be more frugal in choosing their food. This is because their financial instability during this pandemic has caused them to be more frugal in cooking at home than buying food outside.

Furthermore, Choi (2020) stated that university students who have stress would cause their eating behaviours be disrupted. When university students are stressed, they will take pleasure in delicious food or snacks. For example, compared to healthy foods, stress can increase the intake of high-calorie snacks, sugary foods, sweets, and carbohydrate-rich foods (Mikolajczyk et al., 2009). Due to academic stress, online learning makes it harder for university students to maintain a low sense of control, leading to overeating.

This study focuses on the factors influencing eating behaviour among university students during COVID-19 in Malaysia. Thus, for the proposal of further study, further study can be done on eating behaviour among post-COVID-19 university students. Second, diversify the target of this study to the community and society. This is because the focus of this study is only on university students. By broadening the target of the study, the researcher will get a variety of information from the respondents to identify the factors that influence a person's eating behaviour. Thirdly, it is about the data collection methods part. Future studies could use qualitative approaches to explore other aspects that can influence an individual's eating behaviour, and the study should be more comprehensive to get a more honest answer. Furthermore, communication becomes more accessible, and it is beneficial to produce news and information swiftly. Future research should use various sampling strategies, either under probability sampling or non-probability sampling, to solve the generalisation of findings.

CONCLUSION

In conclusion, the researcher explains in more detail whether all the results of the research that have been implemented can answer the research objectives in this chapter. The researcher has seen the results of the three independent variables: parental influence, food price and academic stress, which have a significant relationship with eating behaviour among university students during COVID-19 in Malaysia. The data results indicate that all the independent variables can significantly influence the eating behaviour among university students during the COVID-19 pandemic in Malaysia.

ABSTRACT

The food truck trend began in Malaysia in 2014, when a new food truck comer is offering restaurant menus at a lower price opened in the Klang Valley. Travellers and bloggers have coined the phrase "food porn" to describe the pleasurable sensation of eating and indulging in culinary experiences. Street food is consumed regularly by 2.5 billion people globally, making it the most common sort of public dining. Therefore, the study aimed to investigate factors influencing customer purchase intention towards food truck products. A minimum target of 384 samples has been decided to be collected in this study. With Google Forms, it is much better for collecting data because researchers could easily share the questionnaire and get respondents. This study focused on customer purchase intention towards food truck products: food price, convenience and brand personality. The result showed that some positively play a significant relationship between food price, convenience, brand personality and customer purchase intention towards food truck products.

Keywords: Food Truck, Food Price, Convenience, Brand Personality, Customers' Purchase Intention Towards Food Truck Product

INTRODUCTION

Over the last decade, the food industry has seen steady growth in competition and rapid and continual changes in people's lifestyles and eating patterns. This is evidenced by the rising interest in and success of street meals. Street foods are ready-to-eat foods and beverages produced and sold by vendors or hawkers, notably in the streets and other comparable places. Additionally, the food truck industry has grown at a 9.3 per cent annual rate since 2012.

The food truck trend began in Malaysia in 2014, when a new food truck comer is offering restaurant menus at a lower price opened in the Klang Valley. The food truck business has proliferated over time, with over 500 food trucks in Klang Valley by the end of 2016, including food truck entrepreneur initiatives run by government agencies and independent operators.

This study aims to provide an overview of the affective factors that influence customers' purchase intention towards food truck products. This study's findings are important because the purchase intention toward food truck products is growing. However, this study emphasises the factors influencing customers' purchase intention towards food truck products. There were three objectives of this research:

1. To determine the relationship between food price and customers' purchase intention towards food truck products.
2. To determine the relationship between convenience and customers' purchase intention towards food truck products.
3. To determine the relationship between brand personality and customers' purchase intention towards food truck products.

Significance of the Study

Researcher

The purpose of this study is to determine whether the pricing of food truck food, the convenience of food truck food, and the brand personality of a food truck brand influence consumers' interest in food truck experiences. The results of this study will aid the researcher

in developing a food truck business plan, identifying current issues in the mobile food market, and identifying sales potential and revenue sources. Furthermore, this research will open the door to previously undiscovered avenues of investigation.

Food and Beverage Industry

This research paper benefits the food and beverage industry because it provides insights into the food truck industry in terms of consumer attitudes and interest in food truck experiences. By understanding the level of interest in food trucks, operators and marketers can develop the proper market strategy and design to attract more customers to the industry. By meeting the wants and intentions of customers, the food and beverage industry gains a competitive advantage through better decision-making and profit.

Future Customer

This research identifies and clarifies the elements influencing customer attitudes toward and interest in food truck experiences. Food trucks are a safer and healthier option to street food in terms of health and hygiene. One can gratify the customers with budget-friendly meals because food costs are reasonable. Additionally, the food sold by street vendors is often regarded as dangerous to eat. As a result, customers will be influenced and attracted to buy food truck products.

LITERATURE REVIEW

Food Price

The most crucial reason for customers to dine in a restaurant is their perception of the price and their responses to the price. The term "price" refers to the sum of money spent by customers on a product or service (Claessens, 2015). This is backed up by Zhong & Moon (2020), who assert that pricing can influence a customer's purchasing behaviour. Food prices must remain steady to maintain stability and a sense of confidence among returning customers.

According to Alom et al. (2019), food prices affect customers' expectations of a restaurant's value. When customers evaluate the pricing of food, they consider various aspects, including service quality, food quality, and the physical environment (Zhong & Moon, 2020). The original five service quality characteristics, tangibles, dependability, responsiveness, empathy, and assurance, have also been applied to fine dining restaurants (Cheng et al., 2012; Ryu et al., 2012).

Convenience

"Throughout history, restaurant value has been placed on convenience and the substitution of time for money," indicating that convenience is essential to food service success, especially for quick service restaurants that utilise limiting the time required to be fed.
Convenience is done by simply with which consumers can purchase a service (Jekanowski, Binkley, & Eales, 2001). When it is related to food truck services, consumers think accessibility and convenience to be essential considerations. These qualities reflect the modern way of life and are considered one of the most significant factors in using the services of food trucks (Auad et al., 2019).

Researchers also consider easy meal solutions, effortless measures in finding sufficient time to shop, ability to access the product, and convenience of the purchase area, including ease of bus or car and availability of parking area, to still be essential to consumers during the food purchasing process. (Sulek & Hensley, 2004; Ulku, Hydock, & Cui, 2017).

Brand Personality

Customers may pay more attention to the truck's individuality, conveyed through its design and branding because gourmet food trucks (GFTs) lack a traditional ambience. In the context of a restaurant, brand personality has been described as consisting of four unique dimensions:

competence, honesty, excitement, and sophistication, among other things (Musante et al., 2008).

Gourmet Food Trucks' attractiveness stems partly from their innovative cuisine and distinctive brands, which are portrayed on the truck's exterior by the style and personality of the vehicle. When it comes to full-service and casual restaurants, brand personality has been shown to have a beneficial impact on consumers' positive emotions, which in turn are favourably connected with customer satisfaction.

Customers' Purchase Intention towards Food Truck Product.

A food truck is a large van prepared with a kitchen where meals are ready and served. They're bobbing up throughout the United States and are becoming increasingly popular. Many marketers select a food truck over an eating place due to the fact eating place places are pretty expensive, however, meal vans are some distance, much less so. Food and beverages are made and sold by vendors or hawkers on the street or in similar locations are known as street cuisine. Several studies have looked into the importance of hawkers about street food.

Despite the hawker, street food encompasses a broader idea, including mobile trucks, booths, and stands.

According to Wessel (2012), food trucks are vehicles with novel designs, equipped with restaurant-quality food prep capabilities, and providing ethnically diverse cuisine in tastefully, branded, well-equipped catering trailers. According to Petersen (2014), a modern food truck is equipped with modern equipment for cooking and selling meals. In other words, a food truck is a vehicle that sells food while also incorporating current technology into its operations.

Research Hypothesis

The literature review revealed that the independent variables, such as restaurant food price, convenience and brand personality, were independent. Based on the literature review that had been mentioned and the research question, the hypothesis of this study summarized in the following manner which are:

H_1	There is a significant relationship between food price and customers' purchase intention toward food truck products.

H_2	There is a significant relationship between convenience and customers' purchase intention toward food truck products.

H_3	There is a significant relationship between brand personality and customers' purchase intention toward food truck products.

Research Framework

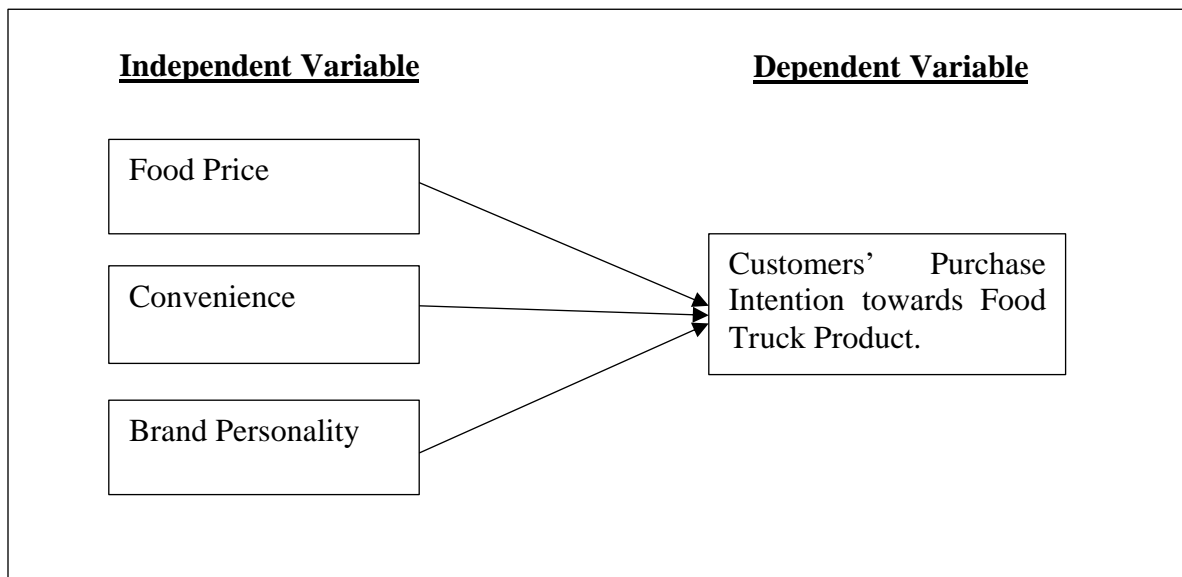
Figure 1 below shows the research framework used for this study


Figure 9: Research Framework

METHODOLOGY

Research Design

This research discusses factors that influence customers' interest in food truck experiences in Malaysia. The research design refers to overall of the research to address the research question by integrating the different components, including how, when and where of the study. The quantitative method will be used in this research to gain all the data through a questionnaire. The Quantitative method is the process to collecting and analysing numerical data. The unit analysis is a factors that influence customer's customers' interest about in food truck.

In this research, the researcher wants to identify the factors that influence customers' interest in food truck experience in Malaysia. Second, descriptive research can be used to gain through questionnaires and will collect the data from respondents to data.

Data Collection

Data collection is the systematic approach to assembling and measuring the information from an assortment of sources in order to get detailed and accurate data. Data collection enables a person or researcher to answer related questions, evaluate results and analyse accurate insights for research regarding upcoming probabilities and trends (Rouse, 2020). With Google Forms, it is much better for collecting data because researchers could easily share the questionnaire and get respondents.

Sampling

The sampling method is the technique for selecting an appropriate number of rudiments from the population. For researchers, sample analysis and understanding of its properties or explanation will simplify the properties or characteristics of the rudiments of the population. Researchers choose certain population rudiments as the study subjects in the sampling process. The sampling method can be divided into two groups: probability sampling and non-probability sampling.

Convenience sampling is a technique where samples are selected from the population as it is conveniently available. In this study, a non-probability sampling technique which is convenience sampling, was selected due to the current situation. Most customers began to recognize this food truck product, so the respondents were selected randomly as anyone could answer the questionnaire given. The questionnaire is designed using Google Form and distributed throughout social media: WhatsApp, Instagram, Twitter and Facebook. By using Google Forms and social media, the researchers could get more respondents.

Data Analysis

The Statistical Package for Social Sciences (SPSS) version 26 is a program that uses descriptive analysis and correlation to describe the relationship between independent and dependent variables. This system is one of the most widely used statistical structures, yet it can be challenging to operate and evaluate using a straightforward manner. Data analysis is the process through which analysts transform a large amount of data into specific findings.

The Statistical Package for Social Sciences (SPSS) could compile tabulated files from nearly any folder, including maps and distribution plots. Reliability analysis, descriptive analysis, and Pearson's Correlation Coefficient are the three types of data analysis.

FINDINGS

Results of Frequency Analysis

Table 42: Frequency Analysis

Characteristics	Frequency	Percentage
Age		
18-25 years old	165	43.0
26-35 years old	97	25.3
36-45 years old	76	19.8
45 years old and above	46	12.0
Gender		
Male	112	29.2
Female	272	70.8
Income Level		
Less than RM1000	68	17.7
RM1001 to RM3000	85	22.1
RM 3001 to RM5000	87	22.7
RM5001 to RM8000	31	8.1
RM8000 and above	20	5.2
No fixed income	93	24.2

This study shows that the age group of 18-25 years is the highest at 165 respondents' equivalent to 43%. While the group aged 45 and above is the lowest at 46 respondents, equivalent to 12%. Furthermore, gender shows that women are the highest at 272 respondents' equivalent to 70.8%. While 112 males, equivalent to 29.2%. In addition, the income level shows that the non-fixed income group is the highest at 93 respondents' equivalent to 24.2%. In contrast, the lowest in the group with an income of RM3001 to RM5000, which is 87 respondents, equivalent to 22.7%. Occupation shows the highest value is private employees, which is 142 respondents, equivalent to 37%. At the same time, the lowest is other occupations, with 23 respondents, equivalent to 6%.

Results of Descriptive Analysis

Table 43: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Food Price	The food truck offered good value for the price.	4.25	0.894

	This food truck experience was worth the money.	4.17	0.924
	This food truck provided me great value as compared to other food truck.	4.18	0.876
	This food truck offered competitive pricing for its food.	4.21	0.825
	The prices charged at this truck were rational.	4.18	0.870
Convenience	I waited in a long line to place my order at this food truck.	2.91	1.137
	I made an effort to eat at this food truck.	3.95	1.041
	I had to wait a long time to receive my food after placing my order at this food truck.	2.77	1.126
	In my opinion, this food truck provide a fast service.	4.08	0.874
	I think this food truck is easy to find.	4.00	1.035
Brand Personality	Food truck is so trendy because the variety of unique and attractive appearances displayed by food truck owner.	4.25	0.866
	I'm excited to know about food truck product because many ethnic foods from all over the world have them there.	4.19	0.879
	I feel that food truck need to follow today's ever changing trends to attract more customers.	4.31	0.830
	I think that food truck are more unique than regular eateries.	4.20	0.864
	In my opinion, food truck are only for young people who want to relax.	3.36	1.315
Customers' Purchase Intention Towards Food Truck Product.	In my future, I would consider returning to this food truck.	4.28	0.878
	I would recommend this food truck to friends and family.	4.24	0.864

	In my opinion, I would say positive things about this food truck to all of my friends and family.	4.21	0.889
	I am glad and satisfied to have satisfied this food truck.	4.23	0.899
	Overall, I'm satisfied with my experience at this food truck.	4.27	0.816

The mean and analysis of the independent variable of food price among clients with a food truck buy intention. Item 1 had the highest mean of 4.25 and the highest standard deviation of.894. This demonstrates that food trucks offer reasonable prices to customers. Item 2 had the lowest mean of 4.17 and a standard deviation of.924, indicating that the food truck experience was worthwhile.

After that, the independent variable is the convenience amount among customers' purchase intention food trucks, as well as the mean and standard deviation analysis results. Item 4 had the highest mean of 4.08 and the highest standard deviation of.874, indicating that respondents believed that food trucks give speedy service to their clients. Item 3 has the lowest mean of 2.77 and the highest standard deviation of 1.126.

Moreover, the result of a mean and standard deviation study on the independent variable of brand personality among customers' purchase intention is food trucks. Item 3 had the highest mean of 4.31 and standard deviation of.830 indicates that the respondent believed that food trucks must keep up with today's ever-changing trends to attract more customers. Item 5 has the lowest mean of 3.36 and a standard deviation of 1.315, indicating that the respondent does not believe that food trucks are exclusively for young people looking to relax.

And the last one is the dependent variable's purchasing intention towards food truck products was the subject of a mean and analysis. Item 1 had the highest mean of 4.28 and the most significant standard deviation of.878; the respondent agreed that they would return to this food truck. Item 3 has the lowest mean of 4.21 and the lowest standard deviation of.889, with the question "in my opinion, I would recommend this food truck to every one of my friends and family."

Result of Reliability Analysis

Table 4 below shows the result of the reliability analysis

Table 44: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Food Price	5	0.871
Convenience	5	0.530
Brand Personality	5	0.744
Customers' Purchase Intention towards Food Truck Product.	5	0.902

Reliability analysis showed that the independent variable food price from Cronbach's Alpha Coefficient is 0.871, and the result is good. Next, convenience shows that Cronbach's Alpha Coefficient is 0.530, and the result is poor. Moreover, Cronbach's Alpha Coefficient for brand personality is 0.744 equivalent result acceptable and for the dependent variable is 0.902 equivalent result excellent.

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 45: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H_1 There is a significant relationship between food price and customers' purchase intention towards food truck product.	0.740	H_1 is supported.
H_2 There is a significant relationship between convenience and customers' purchase intention towards food truck product.	0.402	H_2 is supported.
H_3 There is a significant relationship between brand personality and customers' purchase intention towards food truck product.	0.643	H_3 is supported.

Table 4 shows the relationship between food price and customers' purchase intention toward food truck products is highly positive, with a correlation coefficient is 0.740.

While both significant values are .000, less than the highly significant level 0f 0.05, it shows a significant statistically relationship between food price and customers' purchase intention towards food truck products. Consequently, hypothesis H1 is accepted. In addition, the relationship between convenience and customers' purchase intention towards food truck products is low positive with a correlation coefficient of 0.402. At the same time, both significant values are .000, which is less than the highly significant level 0f 0.05. It shows a significant statistically significant relationship between convenience and customers' purchase intention towards food truck products.

Consequently, hypothesis H2 is accepted. Furthermore, the study shows the relationship between brand personality and customers' purchase intention toward food truck products is moderate positive, with a correlation coefficient is 0.643. At the same time, both significant values are .000, which is less than the highly significant level 0f 0.05. It shows a significant statistically relationship between brand personality and customers' purchase intention toward food truck products. Consequently, hypothesis H3 is accepted. All the result seems to be consistent that food price, convenience and brand personality influenced customers' purchase of food truck products

DISCUSSION AND RECOMMENDATION

The study aims to determine how food pricing, convenience, and brand personality influence customers' purchase of food truck products. The data reveal an important link between the independent factors of food pricing, convenience, and brand personality and the dependent variable of customers' buy intent for food truck items. This notion is supported by previous research that revealed a link between independent and dependent factors.

The findings reveal a strong positive correlation and statistically significant association between meal price and customers' purchase intent for food truck products. This means that a food truck's ability to generate customer satisfaction and positive behavioural intentions depends on offering good value and menu pricing (Han et al., 2009; Kim et al., 2006; Ryu et al., 2012). The food price relationship may interest food truck consumers, who may be especially sensitive to spending substantially more for what would be considered a casual to-go lunch. The importance of food prices varies depending on the type of customer and their food-related lifestyle. People who eat out regularly are likely more conscious of their food's

expense. Food truck owners should prioritise generating value, considering the strong correlation between meal pricing and customer satisfaction identified in this study.

As a result of the findings, it can be concluded that there is a statistically significant low positive correlation strength association between convenience and customers' buy intention for food truck products. The growth of the gourmet, defined as someone who "considers eating a hobby," was traced by Howe (2017). He noted that foodies spend a lot of time documenting food-related activities, which paved the path for food truck success. Because foodies are so concerned with the dish and the experience, convenience may take a back seat. Food trucks may be more than just about getting fed; they may also be about enjoying a unique and exciting gastronomic experience. According to the study, lines are frequently thought to indicate a high-quality product being provided, and customers are willing to wait for it (Sulek & Hensley, 2004; Ulku, Hydock, & Cui, 2017). As a result, food truck customers place a lower importance on convenience.

There is a statistically significant moderate positive link between brand personality and customers' purchase intention for food truck products. According to the findings, customers' purchase intent was linked to brand personality. The most significant motivator for customers to visit food trucks, according to Shin et al. (2017), was a favourable predicted feeling, meaning that appealing décor provides emotional cues that lead to the desire to attend. Food trucks use social media to display their different personalities through their design and cuisine. Customers and passers-by can recognize their uniqueness in their creative names and designs. Food trucks attract customers because of their innovative cuisine and distinct brands, mirrored in the truck's external appearance and personality. Food trucks' innovative names and eye-catching graphics highlight the truck's brand and personality. As a result, brand personality may be an accurate predictor of food truck visits and purchases.

CONCLUSION

In conclusion, this study has evaluated how food price, convenience, and brand personality relationships influence customers' purchase intention towards food truck products. Three independent variables, namely food price, convenience, and brand personality, have been chosen to examine their relationships with the dependent variable: the customers' purchase intention toward food truck products. 384 respondents aged 18 years old and above were selected to examine customers' purchase intention towards food truck products. Overall, based on Pearson's correlation analysis, the food price scored a value of *0.740, followed by the convenience with *0.402, and brand personality with *0.643.

ABSTRACT

This study was undertaken to examine consumer acceptance toward innovation in Malay traditional food. The researcher studied the relationship between attitude, perceived authenticity, and perception of consumer acceptance. To further understand the relationship between consumer acceptance toward innovation in Malay traditional food, a quantitative approach using a questionnaire was employed in the survey to collect relevant data. The survey involved 384 respondents who consume traditional Malay food. The data collected was analyzed using descriptive and Pearson correlation techniques. Descriptive and correlation analyses were used to analyse the data obtained. Findings revealed that the three variables are significantly related to consumer acceptance. Attitude showed the most vital relationship, while perception showed the weakest relationship with consumer acceptance. Lastly, implications and recommendations were provided for future researchers in line with the study.

Keywords: Consumer Acceptance, Traditional Food Innovation, Attitudes, Perceived Authenticity, Perception

INTRODUCTION

Malaysian traditional foods have undergone various stages of evolution and have not been immune to the influence of innovation and the development of modern technology to accommodate modern society (Abdullah & Nor Azam, 2021). Due to technological advancement, the food industry continually innovates food products, especially Malay traditional food, to combat competition and satisfy consumer demands. According to Dogan (2015), innovations in traditional food entail improving the product, process, and distribution of traditional food in ways like non-traditional food while maintaining the natural food identity of traditional food products such as usual, familiar authentic, typical, and inherited. People are often choosing ready-made traditional food products as a lifestyle change due to modernization. According to Muhammad (2015), most of today's younger generations are more exposed to ready-made or convenience foods such as fast food, which may damage the sustainability and property of the standard traditional food itself. Tradition or traditional food defines the peoples, and their various cultures are the food enjoyed by completely distinct generations and passed down and line with its region or locality (Alom et al., (2019).

According to Rahmat, Ramlan, Ghazali and Ngali (2021) the identities and authenticities to each culture, race, religion, and country, traditional food is also seen as a middle of one's cultural identity when compared to others, which the origin, belongingness can distinguish, and components of the preparation depending on where it comes from. Ivanova (2014) acknowledged traditional food is often produced utilizing products readily available in the surrounding region.

According to Ismail (2013), the technological advancements and the development of ready-made items have resulted in a whole new evolution in the preparations of traditional Malay food in large quantities. For example, the design generation of a brand-new Nasi Lemak preparation and packaging Nasi Lemak has been innovated to Instant Paste Nasi Lemak. Indirectly, the taste and flavour, appearance and form, texture of products and ingredients of innovative traditional food products faced severe challenges in preserving their cultural and authentic values.

The aim of the study is to provide insight into consumer acceptance toward innovation in Malay traditional food. The findings of this study are essential since traditional food innovations are growing in modern society.

There are three objectives of this research.

1.   To examine the relationship between attitude toward consumer acceptance of innovation in Malay Traditional food.

2.   To examine the relationship between perceived authenticity toward consumer acceptance of innovation in Malay Traditional food.

3.   To examine the relationship between perception toward consumer acceptance of innovation in Malay Traditional food.

Significance of the Study

To the Consumer

This study will show consumer acceptance of innovations that have a good or bad impact through the reactions of other consumers when evaluating traditional Malay foods. This research paper can also provide future consumers with an overview of how Malay food has evolved.

To the Researcher

This research paper will help researchers determine how consumer acceptance is influenced by attitudes, perceived authenticity, and perceptions of Malay traditional food that has been innovated. This research will allow researchers to identify significant consumer acceptance related to the state of traditional Malay food innovation.

Food and Beverage Industry

This research paper is essential to the food and beverage industry as it will provide insights into the industry toward consumer acceptance of Malay traditional food innovations. Since the minds of consumers can get new opportunities to be filled by certain products, companies that innovate traditional foods will fail if the market fails to embrace those innovations.

LITERATURE REVIEW

Definition of Traditional Food

Traditional and innovations are two distinct generalities that are delicate to attune, especially in this period of further educated consumers (Kuhne, 2010; Guerrero, 2012). Traditional food innovation is something that new in terms of improving product perception features such as improving traditional quality, reducing fat content, upgrading product presentation to be purer, and selling through vending machines to create new aspects of traditional food products and different packaging (Winger & Gavin, 2006).

According to Youn and Kim (2017), innovation in traditional food may ensue based on factors such as the need and demand for safety and preservation to keep quality and supply food that is simple to produce.

Consumer Acceptance Toward Innovation in Malay Traditional Food

Food-related decisions can be difficult to describe since they are frequent, multidimensional, situational, dynamic, and complex (Sobal & Bisogni, 2009). Furthermore, consumer opinions about food products and food manufacturing technology are essential in explaining consumer food choices (Bruhn, 2007; Vassallo et al., 2009). Nowadays, traditional foods have experienced some form of innovation. This could be owing to the necessity for preservation and safety, such as pasteurization and functional packaging (Ronteltap et al., 2007), or it could be related to the industrialization of production. Processes. The examples will be given to emphasize that a new method of working is a fortunate alteration in the recipe and a steadily growing health innovation. According to Barena (2015), consumer decisions regarding the selection of traditional food innovations are based on different age structures, with generation

Y having a high acceptance of innovative traditional foods. Younger consumers are more likely to value the properties of innovative food, and its characteristics are thought to have a more significant impact on their personality (Baregheh et al. 2014).

Attitudes

Attitudes refer to behaviour that describes a person's personality when in a situation that requires a response in a matter. According to studies, a person's attitude is judged in either a favorable or negative light depending on their traits. Fishbein and Ajden (1975) According to Abdullah, the majority of them were in favour of traditional food product innovation. However, acceptance, on the other hand, was conditional on innovation that strengthened the traditional qualities. For instance, a label that guarantees the source of an ingredient or benefits that compensate for or eliminates undesirable traditional qualities, such as fat content decreases (Abdullah & Nor Azam, 2021).

Perceived Authenticity

Abdullah and Azam (2021) stated that food authenticity is described as the genuine originality of food in several aspects. It is also significant in representing a community's culture, family identity, and tradition (Hamzah et al., 2013). According to Asshidin (2016), authentic ingredients influence most people's expectations of authenticity regarding the various qualities that define traditional and ethnic food. The food ingredients contribute substantially to traditional food since they include nutritional content that is important in consumers' daily food consumption. According to Chang (2010), tasting local food is a practical approach to learning about a new culture and can reveal information about what locals eat, how they cook their food, and how the food tastes. This sensory, cultural exploration gives the consumer an authentic experience.

According to Asshidin (2016), authentic ingredients influence most people's expectations of authenticity regarding the various qualities that define traditional and ethnic food. The food ingredients provide a substantial contribution to traditional food since they include nutritional content that is important in consumers daily food consumption. seven elements influence consumer eating expectations for local food: staff quality, sensory appeal, food originality, local service scape, food authenticity, food familiarity, and food diversity. This shows that consumer expectations of food authenticity include food quality, food service, and the physical setting, all of which must be met for the consumer to be satisfied with the local cuisine experience.

Perception

Perception is based on the stimulation of receptors in our sensory system and memory content retrieval (Scholderer, 2010). The main drivers of perception include the sensory nature of the product, individual genetics (Lunde et al., 2012), physiological characteristics (Dnella et al., 2011), consumer memory of previous eating episodes, and familiarity with the product (Puumalainen, Nykopp & Tuorila, 2002), and the context of nutrition whether consumption occurs alone or commentary.Consumer perceptions of traditional foods and modern forms of food can be studied in a country with many traditional foods and recent significant changes in its society (Larasatie & Frost, 2018). Five significant critical aspects can influence perceptions of innovation and the acceptance process, including relative advantage, naturalness, novelty, belief in norms, and discomfort (Levke Albertsen, 2020).

Furthermore, not all changes in food production are compatible with consumer perceptions of acceptability, which is especially true for traditional food product specialities (Larasatie & Frost, 2018). According to Almli et al. (2011), European consumers have trouble purchasing and preparing traditional meals to enjoy the specific taste, quality, appearance, nutritional value, health, and safety. Next, the perception and acceptance of technologically sophisticated foods and products are also influenced by social ideas or beliefs in rules (Albertsen, Wiedmann, & Schmidt, 2020). Consumer views of innovation can be predicted by five fundamental factors: relative advantage, naturalness, novelty, belief in norms, and discomfort (Wiedmann et al., 2020). In research on food innovation, the impact of relative

advantage has been established (Frewer et al., 1998; Joseph et al., 2015). From a business standpoint, according to Larasatie & Frost (2018), neglecting consumer preconceptions when designing modern traditional meals can lead to market failure. Furthermore, from a cultural point of view, continuous development without a proper understanding of consumer perceptions of traditional foods increases the risk of cultural loss regarding food knowledge and diversity in the long run.

Research Hypothesis

The literature review highlighted the independent variables like attitude perceived authenticity, and perceptions. Therefore, the study planned to examine the level of consumer acceptance towards innovation in Malay traditional food among these variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H_1	There is a significant relationship between attitude and consumer acceptance toward Malay traditional food innovation
H_2	There is a significant relationship between perceived authenticity and consumer acceptance of Malay traditional food
H_3	There is a relationship between perception and consumer acceptance of Malay traditional food innovation.

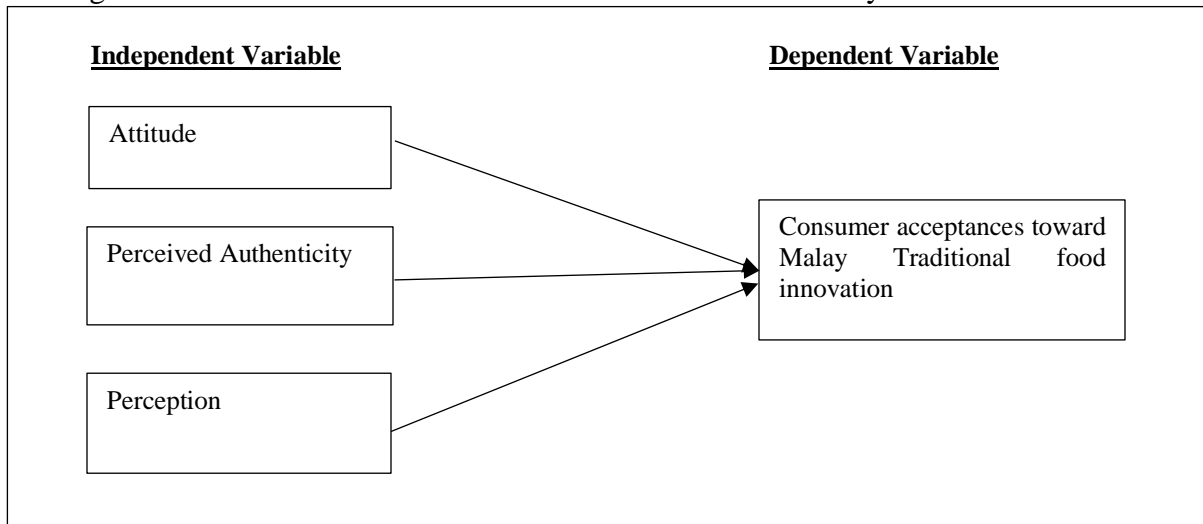
Research Framework
The Figure 1 below shows the research framework use for this study


Figure 10: Research Framework

METHODOLOGY

Research Design

During this research, the researcher will recognize the determinant of consumer acceptance of innovation in Malay Traditional food. The descriptive research is accustomed to the data through the questionnaire obtained from the consumers so that it can be used to justify the data. In the questionnaire, this study used a 5 -point Likert scale as a measurement. The scale is also a type of self-report in which the phenomena of interest are calculated (Grove, Burns, & Gray, 2016). The purpose of a research design is to ensure evidence generated from the data would answer the research question and find consumers' acceptance of innovation in Malay traditional food. This quantitative method is significant in helping identify consumers' attitudes, perceived authenticity, and perceptions towards Malay Traditional Food Innovations.

Data Collection

In this research, a Google form was employed since it is easier to obtain responses from respondents. The questionnaire was chosen as an instrument for the current research using Google Forms. The questionnaire is applied to collect information regarding consumers' attitudes, expectations, and perceptions toward consumer acceptance of Malay Traditional

Food Innovations. After all, the questionnaire is answered by the respondent, and the data is collected. The researcher collected the questionnaire personally from the respondents to secure the information obtained. The final questionnaires collected reported a 100% of response rate with total of 384 usable questionnaires.

Sampling

The sampling method used in this study was non-probability sampling which was convenience sampling. The questionnaire was distributed to the respondents who are among the household living in three urban areas in Peninsular Malaysia through online and social media. The study used this method because questionnaires were prepared and distributed online or posted them to on social media pages to gather information from the respondents.

$$s = \frac{x^2 Np(1-P)}{e^2(N-1) + x^2 p(1-p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as proportion (0.05)
x^2 = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

The number of populations usually determines the sample size. For this research, the sample of this study would be Malay traditional food consumers. Since this research involves a broad population and because the total number of Malay traditional food consumers is uncertain, Krejcie and Morgan (1970), for a population of more than 1000000 people, a sample size of 384 people is required.

Data Analysis

SPSS version 26.0 was used to analyse the quantitative data collected from respondents. Frequency analysis is used to analyse respondents' demographic profile data. Descriptive analysis was employed to identify and examine consumer acceptance toward innovation in Malay traditional food, and Pearson's Correlation was adopted to examine the relationship between consumer attitude, perceived authenticity, and perception of consumer acceptance toward innovation in Malay traditional food.

FINDINGS

Table 1: Analysis of Theme 1

Research Question	Correlation	Interpretation
Is there any relationship between attitudes toward consumer acceptance of innovation in Malay Traditional Food?	P > 0.599, Sig (2-tailed) 0.000	Moderate positive (negative) correlation
Is there any relationship between perceived authenticity towards consumer acceptance of innovation in Malay traditional food?	P > 0.578, Sig (2-tailed) 0.000	Moderate positive (negative) correlation
Is there any relationship between perception toward consumer acceptance of innovation in Malay traditional food?	P < -0.178, Sig (2-tailed) 0.000	Negligible correlation

Result of Frequency Analysis

Table 2: Frequency Analysis

Respondent Profile	Classification	Frequency	Percentage (%)
Gender	Male	177	46.1
	Female	151	53.9
Age	18-21 years	66	17.2
	22-25 years	187	48.7
	26-29 years	80	20.8
	30 and above	51	13.3
Status	Single	252	63.0
	Married	142	37.0
Religion	Muslim	225	58.6
	Christian	57	14.8
	Buddha	55	14.3
	Others	47	12.2
Race	Malay	219	57.0
	Chinese	60	15.6
	Indian	38	9.9
	Others	67	17.4
Education Level	Spm/Stpm	101	26.3
	Diploma	92	24.0
	Degree	162	42.2
	Master	13	3.4
	PhD	7	1.8
	Others	9	2.3
Income	No fixed income	168	43.8
	Below RM 500	34	8.9
	RM 501 – RM 2000	100	26.0
	RM 2001- RM 4000	61	15.9
	RM 4000 Above	21	5.5

Table 1 shows the characterization of respondents 177 out of 384 respondents are male, representing 46.1%, while 207 are female, representing 53.9%. 17.2% of the respondents' were aged between 18 to 21 years old (66 respondents), 48.7% of the respondents' were aged between 22 to 25 years old (187 respondents), 20.8% of the respondents' were aged between 26 to 29 years old (80 respondents), and 13.3% of the respondents were age 30 to above years old (51 respondent). 63.0% of the respondents were single (242 respondent) and 37.0% were married (142 respondent). There was 384 total respondents who consisted of Muslims, with the highest number of respondents which is 58.6% (225 respondents), Christian 14.8% (57 respondents), Buddha 14.3% (55 respondents) and the lowest highest percentage were other religions 12.2% (47 respondents). Out of 384 total of respondents, 57% of total respondents were Malay (219 respondents), followed by Chinese (60 respondents) 15.6%, Indian (38 respondents) 9.9%, and the remaining 17.4% were other respondents by race involved in this study. The majority of the respondents were from Degree with 42.2% (162 respondents), followed by respondents from Spm/Stpm with 26.3% (101 respondents). There were 24.0% (92 respondents) from Diploma, 1.8% (7 respondents) from respondents Phd, 3.4% (13 respondents) currently from Master and 2.3% (9 respondent) from other education level. Next, the highest percentage of respondents by income level was no fixed income at 43.8 % (168), followed by RM501-RM2000 at 26.0%

(100 respondents). The income level was 15.9 % (61 respondents) from RM2001 – RM4001. Below RM500 was 8.9 % (34 respondents), followed by RM4000 and above was 5.5% (21 respondents).

Result of Descriptive Analysis
Table 3: Descriptive Analysis

Variables	Statements	Mean	SD
Attitude	I prefer to buy innovative traditional food products rather than authentic traditional food	3.30	1.144
	I feel like it takes less time to prepare and eat ready meals compared to authentic traditional foods	3.39	1.126
	Ready meals don't waste time.	3.44	1.161
	I prefer to buy a ready meal that provides me with the quality information	3.39	1.107
	I believe that there's a familiarity between ready meals and authentic traditional food	3.59	1.199
Perceived Authenticity	The taste and flavor of innovative traditional Malay food products is like the authentic traditional Malay foods	3.24	1.089
	The appearance and shape of innovative traditional Malay foods are similar to authentic traditional Malay foods.	3.35	1.003
	The texture of the products is like authentic traditional Malay foods	3.27	1.043
	The ingredients used in the products are authentic and similar to Traditional Malay foods.	3.33	1.081
	When I eat food products, it reminds me of the nostalgic feelings with my family.	3.49	1.110
Perception	There are plenty of tasty foods around, so we don't need to use new food innovations to produce more.	3.02	1.248
	the benefits of new food innovation are often grossly overstated.	3.04	1.208
	New food innovation decreases the natural quality of food.	3.09	1.247
	New foods are not healthier than traditional foods	3.03	1.260
	Society should not depend heavily on innovation to solve its food problems.	3.08	1.237
	It can be risky to switch to new food innovation too quickly	3.05	1.205
	New products produced using new food innovation can help people have balanced diet	3.64	0.993

Consumer Acceptance	I like and enjoy the taste and texture of the products.	3.99	1.049
	The appearance of the innovative traditional food products looks appetizing	3.85	1.077
	I will purchase the products again in the future	3.85	1.074
	I will recommend the products to others	3.81	1.099
	I am satisfied with the overall quality of the product.	3.93	1.044

The "Consumer Attitude" score was the highest (mean = 3.42), indicating that consumer attitude determined customer acceptance since respondents agreed with most of the items. Respondents agreed that there's familiarity between ready meals and authentic traditional food (mean = 3.59, SD = 1.199). The respondents agreed that ready meals don't waste time (mean = 3.44, SD = 1.161), and they feel it takes less time to prepare and eat ready meals compared to authentic traditional foods. At the same time, respondent also prefers to buy a ready meal that provides them with quality information (mean = 3.39, SD = 1.126, 1.107). Meanwhile, respondents who prefer to buy innovative traditional food products rather than authentic traditional food scored the lowest (mean = 3.30, SD = 1.144). The finding is in line with previous research by Bearth & Siegrist (2008); whether a consumer accepts or rejects a new product meal is determined by their willingness to buy or pay, a positive attitude, desire to use, or general acceptability.

"Perceived authenticity" scored second (mean = 3.33). Respondents agreed that when they eat food products, it reminds them of the nostalgic feelings with their family. (mean = 3.49, SD = 1.110). Respondents were neutral that the appearance and shape of innovative traditional Malay foods are similar to the authentic traditional Malay foods (mean = 3.35, SD = 1.003), and ingredients used in the products are authentic and similar to the Traditional Malay foods (mean = 3.33, SD = 1.081). Respondents were neutral that the texture of the products is like authentic traditional Malay foods (mean = 3.27, SD = 1.043). Meanwhile, the taste and flavor of innovative traditional Malay food products, like authentic traditional Malay foods, scored the lowest (mean = 3.24, SD = 1.089). The finding indicates that authentic ingredients influence most people's expectations of authenticity regarding the various qualities that define traditional and ethnic food is supported by Zhang et al.,. (2019).

"Perception" scored the lowest among the variables (mean = 3.13). Specifically, respondents agreed that new products produced using new food innovations can help people have a balanced diet (mean = 3.64, SD = 0.993). Respondents were neutral about new food innovations decreasing the natural food quality. (mean = 3.09, SD = 1.247) This is under the finding of Larasatie & Frost (2019) not all changes in food production are well received by consumers, which may be especially crucial for traditional culinary specialities. Next, society should not depend heavily on innovation to solve its food problems (mean = 3.08, SD = 1.237) followed it can be risky to switch to new food innovation too quickly (mean = 3.05, SD = 1.205), and the benefits of new food innovation are often grossly overstated (mean =3.04, SD =1.208). Next, the second lowest is respondent neutral about new foods are not healthier than traditional foods (mean = 3.03, SD = 1.260). Plenty of tasty foods around, so we don't need to use new food innovations to produce more, scored the lowest (mean = 3.02, SD = 1.248).

The dependent variable – consumer acceptance, scored 3.88. Respondents strongly agreed with satisfied with the overall quality of the product" (mean = 3.93, SD = 1.044). The appearance of the innovative traditional food products looks appetizing, and Respondents will purchase the products again the score second (mean = 3.85, SD = 1.077, 1.074). Respondents will recommend the products to others (mean = 3.81, SD = 1.099). Past research proves that

consumer opinions about food products and food manufacturing technology have an essential role in explaining consumer food choices (Sajdakowska et al., 2018).

Result of Reliability Analysis

Table 4: Reliability Analysis

Variable	Number of items	Reliability Cronbach's Alpha	Level of reliability
Attitude	5	0.189	Unacceptable
Perceived Authenticity	5	0.221	Unacceptable
Perception	7	0.843	Good
Consumer acceptance of innovation in Malay traditional food.	5	0.415	Poor

Table 4 showed the reliability analysis results by Cronbach's Alpha for each independent and dependent variable. The first one, attitude, had a total of 5 items under it with a Cronbach's Alpha value of 0.189 with the reliability level of unacceptable (< 0.4). The following independent variable is perceived authenticity with 5items. The Cronbach's Alpha value for this variable is 0.221. This value is the same as the attitude for the reliability level of unacceptable (< 0.4). The third independent variable used in this study is perception, which had 7 items to test, and Cronbach's Alpha value is 0.843. This value is under the reliability level of good (< 0.8).

The dependent variable, the consumer acceptance of innovation in Malay traditional food, had 5 items. The Cronbach's Alpha results for this variable is 0.415, under the poor reliability level.

Result of Pearson Correlation Analysis

Table 5: Pearson Correlation Analysis

		Consumer Acceptance toward Malay Traditional Food Innovations
Attitudes	Pearson Correlation	.599[**]
	Sig. (2-tailed)	.000
	N	384
Perceived Authenticity	Pearson Correlation	.578[**]
	Sig. (2-tailed)	.000
	N	384
Perceptions	Pearson Correlation	-.178[**]
	Sig. (2-tailed)	.000
	N	384

**. Correlation is significant at the 0.01 level (2-tailed).
The Summary for The Hypothesis Testing

Table 6: relationship hypothesis testing and discussion of result

Hypothesis	P-Value	Result (Supported/Not Supported)
H₁: There is significant relationship between attitudes toward consumer acceptances of innovation in Malay Traditional Food	0.599	H1: Supported
H₂: There is a significant relationship between perceived authenticity and consumer acceptance toward Malay traditional food.	0.578	H2: Supported
H₃: There is no significant relationship between perception toward consumer acceptances of innovation in Malay traditional food.	-0.178	H3: Not Supported

Table 6 shows the relationship between hypothesis testing and the discussion of results. This study was conducted to see the consumer acceptance toward innovation of Malay Traditional Food for consumer attitudes, perceived authenticity, and perceptions.

Research objective 1: To examine the relationship between attitudes toward consumer acceptances of innovation in Malay Traditional Food

The result shows the association between attitude and consumer acceptance of innovation in Malay traditional food is 0.599, as shown in the graph. The correlation coefficient's positive value of 0.599 revealed that their link is moderate positive. As a result, the H1 hypothesis, which measures the relationship between attitude and consumer acceptance of innovation in Malay traditional food, is accepted. According to Abdullah and Nor Azam (2021), most of them favoured traditional food product innovation. However, acceptance, on the other hand, was conditional on innovation that strengthened the traditional qualitiesH2: There is a significant relationship between service quality and customer revisit intention toward Mamak restaurant in Penang.

Research objective 2: To examine the relationship between perceived authenticity toward consumer acceptances of innovation in Malay Traditional Food

The result of hypothesis H2 was reviewed to answer RQ2. H2 stated a significant relationship exists between perceived authenticity and consumer acceptance of Malay traditional food. From the findings, it is moderately positive with a correlation coefficient of 0.578 while P-value is (>0.05), which is less than a highly significant level of 0.001. Therefore, H2 is accepted. The term "authenticity" can be characterized as the idea of being 'original' or 'faithful to an original, and its application implies being true to what someone (or something) truly is (Guignon, 2008). Based on the quality characteristics of the innovation, it is critical to improve and retain the traditional character of authentic Malay foods as much as possible in the innovation in terms of the sensory properties of the products, precisely the taste, flavour, and texture (Abdullah & Nor Azam, 2021). This indicated that if the perceived authenticity of consumer acceptance toward Malay traditional food innovation is positive, the possibility of them accepting the innovation is higher.

Research objective 3: To examine the relationship between perception toward consumer acceptances of innovation in Malay Traditional Food

The results of Pearson's Correlation for perception show a negative relationship between perception and the consumer acceptances of innovation in Malay traditional food. The results showed that the consumer acceptance of innovation in Malay traditional food.

Was 1 and the perception was shown -0.178. Thus, there is a negligible correlation between the dependent and last independent variables. Hence, it is also unacceptable for H3 in this research. According to Hui et al., (2021) perception refers to the way sensory information is interpreted and consciously experienced of a food product. Therefore, it is having a strong positive and highly significant impact on consumer perceived value, respectively a strong negative and highly significant impact on the consumer perceived risk.

In research on food innovation, the impact of relative advantage has been established (Frewer et al., 1998; Joseph et al., 2015). From a business standpoint, according to Larasatie & Frost (2018), neglecting consumer preconceptions when designing modern traditional meals can lead to market failure. Furthermore, from a cultural point of view, continuous development without a proper understanding of consumer perceptions of traditional foods increases the risk of cultural loss regarding food knowledge and diversity in the long run.

DISCUSSION & RECOMMENDATION

Based on this research, the researcher examined the effect of consumer acceptance toward Malay traditional food innovation. These studies had shown that the variables, consumer acceptance as the dependent variable and attitude, perceived authenticity and perception as the independent variable, were significantly correlated with the dependent variable. It is also having a positive correlation and negative correlation relationship. The Pearson's Correlation value (r value) are 0.599, 0.578 and -0.178.

As the recommendations for future studies, the researcher suggests that future research improve collecting data. For instance, future research can give the questionnaires to professionals such as chefs or hospitality students. So, it can help the researcher to collect more data about Malay traditional food innovation by giving it a long period ofcollect more data about Malay traditional food innovation by giving it a long time to answer a given survey. Therefore, it also will help the researcher to be able to get more accurate data and even more convenient in answering the questionnaire and help the researcher to find more respondents to filling out the questionnaire.

Furthermore, in the following recommendations for future research, the researcher suggests using the qualitative method by open interview. So, the data collected can help the researcher get a richer understanding gleaned from personal interaction. Therefore, if the researcher has open-ended questions, it can help to increase the opportunity for respondents to share their points of view and additional specific answers. Further, the interview method allows in-depth investigation of issues from fewer people and produces descriptions of situations, events, people, interactions and observed behaviour.

As a suggestion for future research, the researcher suggested that future researchers conduct research among the millennial generation. This is said because this generation has the potential to move the economy in terms of food production innovation to Malay traditional food. Through this matter, the researcher is confident that it can help the community increase their knowledge to recognize the innovations made to traditional Malay food. At the same time, it can open the eyes of the community not only to focus on innovation in food from other countries such as Korea and Thailand.

Moreover, the research should also be to collect the data in a specific location, especially on people who live in rural or village areas. Indirectly, it is ideal for helping the researcher to introduce the Malay traditional food innovation to all ages where it can save preparation time, human labour, and the uniqueness of the taste of the innovative food.

CONLUSIONS

This research examined the factors of consumer acceptance towards innovation in Malay traditional food. Overall, the results show that perceived authenticity and perception have a low

relationship to innovation in Malay traditional food. Although most respondents agreed that consumer attitude contributes the most to Malay traditional food innovation, the evidence that the relationship between consumer attitude and Malay traditional food innovation is modest because consumers today do not consider Malay traditional food a widespread matter. The study also proves that although the determinants are still far from reaching the maximum level, consumer acceptance of innovation in Malay traditional food should be continued to ensure that the position of Malay traditional food is not forgotten. This is because of various types of food innovations from other countries that can challenge the position of Malay traditional food. Therefore, the objectives of this study were achieved.

3. To identify the relationship between quality value toward local food consumption among domestic tourists in Kota Bharu, Kelantan.

3. To determine the relationship between quality value toward local food consumption among domestic tourists in Kota Bharu, Kelantan.

Significant of Study

Tourism Industry

This research is important to the tourism industry because local food consumption has become one of the choices for tourists to travel. The factors influencing local food consumption should make the tourism industry more understand what reasons tourists consume local food in a destination. Hence, the tourism industry should be able to improve the travel plan provided to domestic or foreign tourists.

To Domestic Tourist

Domestic tourism encourages people to travel within their own countries. This is important at major tourist attractions so that visitors feel safe and satisfied, and tourists may stay longer and visit more places. Tourists can also sample the uniqueness of local cuisine in a variety of various settings.

To Researcher

The highlights point here is the benefit of this research paper to all future researchers. This is because future researchers can use this article to learn about domestic tourist behaviour toward local food consumption. Researchers are also allowed to take an important part of some greatest point on this report to improve their ideas and writing skills.

Local Food Restaurant

The local food restaurant owner in Kota Bharu also will benefit from this research. This is because can find the strategy on how to attract the domestic tourists around Malaysia to come to restaurant and identify what type of local food can give domestic tourists more satisfaction. Thus restaurants generate revenue from selling the local food and do some good marketing to promote the local food in Kelantan.

LITERATURE REVIEW

Eating Local Food

According to Mkono et al. (2013), the typology of the visitor experience in terms of food consumption has been examined. Due to the employment of food tourism as a destination marketing technique, the effects of food on the culinary travel experience, tourist satisfaction, and choice of local food have been actively explored (Kim et al., 2013).

Local food acts as a primary channel for tourists to enjoy a destination's culture and evaluate their cultural capital, known as epistemic value (Alom et al., 2019). People that relocate to other regions or countries will maintain their traditional eating habits, tastes of their local food, and local food cooking methods. In Malaysia, Nasi Lemak, Rendang, Nasi Ayam, Laksa, and various other dishes are among the most well-known (Raji et al., 2017). In Malaysia, rice is a staple food and, more specifically, among the Malays. Kamaruzaman et el. (2020) mentioned that rice and its products are widely employed in numerous local meals.

Emotional Value

There one of the factors influencing Kelantan's local food consumption among domestic tourists in Kota Bharu Kelantan is emotional value. Thomson et al. (2005) state that attachment emotions must be distinguished from other constructs associated with it, such as attitude, satisfaction, and brand engagement attitudes and experience is different from the concept of motivation, brand attachment, or customer pleasure. If the experience exceeds expectations, positive emotions will arise and vice versa if the experience does not match the expected level of service. More communication and interaction can strengthen the community.

Emotional value is the affective or emotional benefit that products can provide customers, such as enjoyment, satisfaction, and so on. According to Nambisan & Baron (2010), customer emotional value experience is interactive and relative, and customer emotional experience value is a significant result obtained by customers participating in online community activities. Neural emotional bonding occurs after emotional awakening, in which our brain and nervous system become more active when we are motivated by the experience. As a result, emotionally charged events will last longer in our memory. The brain will remember the emotional component of an experience better than other aspects.

Epistemic Value

One factor that influences Kelantan's local food consumption among domestic tourist in Kota Bharu Kelantan which is epistemic value. Epistemic means the extent that a cognitive process can provide accurate knowledge. Thus, epistemic value is the specific attribute of a theory or cognitive process to provide knowledge. This is because epistemic value has had a positive effect on tourists' healthier eating choices and also gave a positive impact on positively impacted tourist's attitude towards Kelantan local food too (Raza et al., 2021).

Tourists receive epistemic value when tasting Kelantan local food, so they can search for the recommended street food in multiple areas, fulfilling their curiosity to experience the taste and get a closer look at the famous street food at its place of origin and tourist also can know that real Kelantan's cuisine is not same in other's place, especially the place which is not in Kelantan. Thus, by that experience the tourist will know that Kelantan's cuisine in other places is not original, and there are a lot of differences from the real recipe.

Quality Value

The quality value factor also influences Kelantan local food consumption among domestic tourists in Kota Bharu Kelantan. The relationship between expectations and quality could indicate that a consumer's perception of quality is influenced by familiarity and knowledge with the suggestion that if domestic tourists are given more information about local food, they will have more reasonable expectations, resulting in a higher perception of quality. Tourists see restaurants as an important feature of a tourist destination, as places where the food quality, service and physical atmosphere may display local customs and culture, shaping the domestic tourist local food experience (Klag at el., 2003).

Meanwhile, according to Yan et al. (2015), meal quality and service quality were antecedents of a customer's inclination to return to a restaurant serving local food. Nevertheless, Wu et al. (2018) found that the overall quality of the experience impacted domestic tourists' desire to eat local food, especially the desire to revise. As the primary product of commercial food service, food quality plays a significant role in the dining experience and the success of restaurants in tourist areas. According to Uehara & Assarut (2020), in Japan, the perceived quality of the restaurant in Japan on serving local Japanese food is influenced by the authenticity of dishes and ingredients. This shows the food quality on authenticity, price, nutritious and fresher and the aspects that researchers can take to be measured to domestic tourists who eat local Kelantan food.

Research Hypothesis

According to the literature review, independent variables such as emotional, epistemic, and quality value influence Kelantan local cuisine consumption among domestic tourists in Kota Bharu, Kelantan. As a result, the study intended to examine the effect level between these variables. The hypotheses of this study were summarised in the following manner based on the literature discussed:

H_1 There is the relationship between emotional value toward local food consumption among domestic tourists in Kota Bharu, Kelantan.

H_2 There is the relationship between epistemic value toward local food consumption among domestic tourists in Kota Bharu, Kelantan.

H₃ There is the relationship between quality value toward local food consumption among domestic tourists in Kota Bharu, Kelantan.

Research Framework

Figure 1 below shows the research framework used for this study.

Figure 1: Research Framework

METHODOLOGY

Research Design

This research was conducted quantitatively, which is a structured way of collecting and analyzing data obtained from different sources (SIS International, 2018). The target population in this research was people who had visited Kelantan. There were 385 respondents contributed to the questionnaire, but the data was collected from only 362 respondents who had visited Kelantan.

This questionnaire used the format of multiple choices and 5-point Likert Scales of Agreement. Moreover, the questionnaire was divided into 4 sections which are: screening questions, demographic section, independent variables section and dependent variable section. For screening section the questionnaire requested for filtering the respondents who had beenthe screening section, the questionnaire requested to filter the respondents who had visited Kelantan. For the demographic section, the questionnaire was requested general information such as gender, age group, races, education level, occupation and marital status. While the independent and dependent variable section, the questionnaire was elaborated such as emotional value, epistemic value and quality value which were examined in this research.

Data Collection

The data collection was conducted using a questionnaire using the Google Form application. The questionnaire link was posted on social media such as WhatsApp, Facebook and Instagram. It was easy and minimized cost way to collect the data.

Sampling

In this study, the convenience sampling was used, one of non-probability sampling due to this sampling technique being quick and simple and there are plenty of things to choose from (Etikan, 2016). This sampling method helped researchers to focus on domestic tourists that have experience eating local food in Kota Bharu, Kelantan. By using convenience sampling, the respondents that the researcher selects will be selected randomly from any Malaysian domestic tourist who has experience visiting Kota Bharu, Kelantan and could answer the questionnaire given.

Data Analysis

In this research, the data analysis used descriptive analysis for screening questions and demographic, a reliability test for independent and dependent variables and Pearson Correlation analysis for the relationship between independent and dependent variables. The data were analyzed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1: Frequency Analysis

Characteristics	Frequency	Percentage
Reason		
Travel	90	24.9
Study	220	60.8
Work	19	5.2

Student	283	78.2
Private Sector	29	8.0
Government Sector	39	10.8
Others	11	3.0
Status		
Single	323	89.2
Married	39	10.8

The table showed a high frequency with 220 (60.8%) respondents visiting Kelantan because of study due to there being two public universities in Kelantan. There are 90 (24.9%) respondents who have visited Kelantan because of travel, while there is the lowest frequency with 19 (9.1%) respondents visiting Kelantan because of work. The highest frequency and percentage of respondents who visited Kelantan was 160 (44.2%) respondents who visit Kelantan every day, while the lowest frequency was 8 (2.2%) respondents who visited Kelantan twice per month.

Next, the highest frequency state respondents were Kelantan with 64 (17.7%) respondents, while the lowest frequency state respondents were Melaka with 7 (1.9%) respondents. The frequency and percentage of women is 194 respondents, and the overall percentage is 53.6%. While the frequency of men is 168 respondents, and the overall percentage is 46.4%. In addition, the frequency and percentage of the age group of respondents showed the highest frequency of the respondents is 21-25 years with 266 (73.5%) respondents. Then, the lowest frequency was aged 41 years and above, with 3 (0.8%) respondents. The highest income level was no income with 193 (53.3%) respondents, and the lowest frequency was RM 5,001 to RM 8,000 and RM 8,000 and above with 3 (0.8%) respondents. While the highest frequency of respondents' race was Malays with 271 (74.9%) respondents, there were one respondent from others.

For the frequency and percentage of respondents' occupations, the highest frequency respondent's occupation was a student with 283 (78.2%) respondents. The lowest frequency was others with 11 (3.0%) respondents, including housewives or self-employed. Lastly, it showed the frequency and percentage of respondents' marital status. The highest frequency of respondents' marital status was single, with 323 (89.2%) respondents, while the lowest frequency was married to 39 (10.8%) respondents.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Emotional Value	I think that eating Kelantan food make me feel happy.	4.43	0.73
	I think that eating Kelantan food gives me pleasure.	4.40	0.75
	I think that eating Kelantan food changes my mood positively.	4.29	0.83
	I think that I am fascinated by Kelantan food.	4.41	0.77
	I think that Kelantan food makes me crave it.	4.39	0.78
	I think that eating Kelantan food make me feel excited.	4.38	0.77
Epistemic Value	I think that I want to seek out more information about Kelantan food.	4.23	0.82
	I think that I am more curious about Kelantan food.	4.26	0.82
	I think that eating Kelantan food is a good opportunity for me to learn new.	4.33	0.75
	I think that I want to try more diverse Kelantan food.	4.34	0.74
	I think that my knowledge of Kelantan culture has increased.	4.30	0.75
	I think that I learned 4 dining habits through my Kelantan food experiences (Example: How to eat the food, and how to use utensils).	4.27	0.83
Quality Value	I think that Kelantan food provides a variety of ingredients.	4.45	0.67
	I think that Kelantan food provides appealing flavours.	4.45	0.73
	I think that Kelantan food provides good quality ingredients.	4.36	0.74
	I think that Kelantan food is tasty.	4.48	0.68
	I think that Kelantan food provides a high standard of quality	4.36	0.78
Local Food Consumption Among Domestic Tourists	I love Kelantan food based on the quality.	4.37	0.70
	I love Kelantan food based on my good knowledge about Kelantan food.	4.24	0.77
	I love Kelantan food based on my emotions to eat.	4.27	0.85
	I have eaten Kelantan food before.	4.59	0.68
	Local food in Kelantan is delicious.	4.52	0.73
	I think Kelantan food is good.	4.48	0.72

The mean values for the independent variable, emotional value, were displayed in the table. The item with the highest mean value of 4.43 and the most substantial level of agreement is "I think that eating Kelantan food makes me feel happy." It reveals that the majority of

respondents agree that emotional value has a significant impact on domestic tourist food consumption. Consuming Kelantan cuisine makes you joyful, excited, and in a good mood.

The mean value of independent value and epistemic value were also shown. The item "I think that I want to try more diverse Kelantan food" had the highest mean value of 4.34, indicating a strong level of agreement. It demonstrates that respondents were fascinated by the history of Kelantan food and also wanted to understand the culture when they ate Kelantan food.

The independent variable's mean value, quality, was shown the lowest mean value of 4.36 for two items, "I think that Kelantan food provides good quality ingredients" and "I think that Kelantan food provides a high standard of quality" strongly agrees. Respondents valued taste, quality ingredients, and cleanliness in Kelantan meals.

The mean value of the dependent variable, local food consumption among domestic tourists, is likewise shown the item "I had eaten Kelantan food before" received the highest mean value of 4.59, for "Local food in Kelantan is delicious" It demonstrates how domestic tourists consume native Kelantan food based on quality, sentiment, and epistemic considerations.

Result of Reliability Test

Table 3: Reliability Test

Variable	Number of Items	Cronbach Alpha
Emotional Value	6	0.937
Epistemic Value	6	0.921
Quality Value	5	0.925
Local Food Consumption Among Domentic Tourists	6	0.868

Table 4.18 showed the reliability analysis results by Cronbach's Alpha for each independent and dependent variable. The first one, emotional value, had a total of 6 items under it with a Cronbach's Alpha value of 0.937 with the reliability level of excellent (≥ 0.90). The next independent variable is the epistemic value with 6 items. The Cronbach's Alpha value for this variable is 0.921. This value falls under the reliability level of excellent (≥ 0.90).

The third independent variable used in this study is quality value, which had 5 items to test, and Cronbach's Alpha value is 0.925. This value is under the reliability level of excellent (≥ 0.90).

The dependent variable, the local food consumption among domestic tourists, had 6 items, the Cronbach's Alpha result for this variable is 0.868, which is under the reliability level of good (0.80-0.89).

Result of Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H$_1$: There is a significant relationship between emotional value toward local food consumption among domestic tourists in Kota Bharu, Kelantan.	0.825	H$_1$ is supported/
H$_2$: There is a significant relationship between epistemic value toward local food consumption among domestic tourists in Kota Bharu, Kelantan.	0.706	H$_2$ is supported
H$_3$: There is a significant relationship between quality value toward local food	0.826	H$_3$ is supported.

consumption among domestic tourists in Kota Bharu, Kelantan.		

Table 4 above shows the Pearson Correlation Analysis. Hypothesis one showing a correlation of 0.825, a strong positive correlation between emotional value and local food consumption among domestic tourists. Besides that, hypothesis two showed a correlation of 0.706, a strong positive correlation between epistemic value and local food consumption among domestic tourists. Then, hypothesis three showed 0.826, a strong positive correlation between quality value and local food consumption among domestic tourists.

DISCUSSION AND RECOMMENDATION

Discussions are aimed at solving questions and addressing hypotheses, as mentioned in the first chapter of this study. Based on the study, several recommendations are provided for future researchers: change the methodology sampling from convenient to purposive sampling. Due to purposive sampling, also known as judgement sampling, a participant's purposeful selection based on their characteristics (Ilker Etikan, 2016). It is commonly used in qualitative research to find and pick the most information-rich examples to make the best use of available resources (Patton et al., 2002).

Besides that, future researchers should be concerned with more independent variables other than this study, such as health value, prestige value, price value, and interaction value. This would help gather more information and complete research on factors influencing local food consumption among domestic tourists in Kota Bharu, Kelantan.

CONCLUSION

In conclusion, this research aimed to determine the factor influencing local food consumption among domestic tourists in Kota Bharu, Kelantan. Emotional value, epistemic value and quality were chosen as independent factors to investigate their correlations with the dependent variable, which is the factor influencing local food consumption among domestic tourists in Kota Bharu, Kelantan. 362 respondents aged 18 and up were chosen from all Malaysian states to assess their local food knowledge. Overall, according to Pearson's correlation analysis, the emotional value element received a score of *0.825, followed by epistemic value with *0.706 and quality value with *0.826.

Interpersonal Relationship, Workload Pressure, Work Environment, and Job Stress among Hospitality Internship Students

Revathy A/P Sivaguru, Nor Aidah Bt Tonmezi @Tarmezi, Norakmalisa Azwani Binti Hamadan, Muhammad Faris Bin Mohd Saidi &*Abdullah Muhamad Yusof

Faculty of Hospitality, Tourism and Wellness, University Malaysia Kelantan

Corresponding email: adbullah.my@umk.edu.my

ABSTRACT

Job stress is a type of stress that is induced by work situations that negatively impact an individual's performance and physical well-being. Internships are crucial in all businesses, but in the hospitality industry, the more experience students can gain "serving" customers and guests, the better their chances of promotion. Interpersonal interactions, workload pressure, work environment, and job stress levels are investigated among hospitality internship students in this study. This study aims to discover and examine the link between interpersonal relationships, workload pressure, and work environment and job stress among hospitality internship students. A total of 177 people participated in this study, which was performed using a Google form. This research focused on University Malaysia Kelantan hospitality internship students. The findings revealed that work environment, workload pressure, and interpersonal relationships all play a significant influence in causing workplace stress among hospitality internship students.

Keywords: Hospitality, interpersonal, stress, Internship, Pressure, relationship

INTRODUCTION

An individual who has the stress at the workplace wake weary, unable to meet job requirements, and running out of steam. For the internship student, workplace stress is one of the regular occurrences things for the workplace environment, the workload they received and their ability to handle the work given especially for students in theospitality ((Abu, 2011)). A student in the hospitality industry-, had to work in a kitchen environment which was among the highest tiredness.

In industry hospitality, an individual is involved in labour-intensive with anti-social working hours, intense client contact, and highly emotional labour features in a changing environment. This situation has led to a stress issue for employees and intern students in the hospitality industry. Almost 50% of total employees suffer from depression of overwork, The stress problem that occurred among the internship student was increasing and affected their well-being and health of internship students ((Apuke, 2017)). Naturally, the hospitality industry is fast-paced with lots of pressure.

This study aimed to investigate the relationship factors infusing job stress among the University Malaysian Kelantan (UMK) hospitality internship students. The relationship factors such as interpersonal relationships, workload pressure, and work environment affected job stress for hospitality internship students. There were three research objectives of this study:

1. To determine the relationship between interpersonal relationships and UMK internship student

2. To analyse the relationship between workload pressure and UMK internship students.

3. To analyze the relationship between the work environment and UMK internship students.

Significance of the Study

Researcher

Job stress has been recognized as a major factor in intern students abandoning the hospitality industry along with other considerations such as excessive hours. This research was providing clear information to new researchers. The research also provides new resources, knowledge,

and the latest information on the relationship between workload pressure, interpersonal relationships, and work environment influenced the job stress of internship students.

Student

This study is significant for students because can help them to know a little about the internship in industry hospitality in the future. This study was also significant to the student who was going to the internships. All student needs to undergo an internship to finish their study. Students need to know about internships and how to deal with stress when they intern later.

LITERATURE REVIEW

Overview of Internship

The content of hospitality interns at University Malaysia Kelantan with their internships may play an important influence in determining their direct experience while still in university. Since the hospitality industry is labour-intensive, technology may not be a viable solution for most of the operation. As an outcome, the student has a significant impact on the industry's growth which belongs to exhaustion and having to deal with heavy workload pressures while doing the internship. Furthermore, internship roles are typically scheduled to work, leading to weariness. Thus, the hospitality industry has a higher risk of occupational stress because of the nature of the service sector and the emotional labour involved. Previous research has indicated that even the most committed person may experience burnout due to hospitality and turn to be less dedicated to the industry. ((Abdullah, 2011)). As an outcome, it was being led to a significant impact on the industry growth, which belongs to exhaustion-and must deal with heavy workload compressions to students while doing internships.

Interpersonal Relationship

For people of all ages, the quantity and quality of interpersonal relationships have been determined as one of the most influential factors of happiness and life satisfaction. The development of relationships in the workplace also benefits cooperation and unity in the business to be better (Jehn, 1997). The results of the study also show that friendships at work can improve individual employee attitudes such as job satisfaction and job commitment in their organization ((Ellingwood, 1991)

Failure to manage interpersonal relationships in the workplace resulted in adverse effects on individuals and companies. There are several organizations with no cordial relationships among staff members, subordinates, and superiors. This attitude is very unhealthy for an organization. This situation puts stress on workers. Stress is described as a change in one's mental or physical state as a result of situations (stressors) that offer a challenge or burden ((David S. Krantz, 1985). Stressful employees are more likely to suffer anxiety, anger, and irritability (Arnold, J. 2005), which can impact their ability to maintain interpersonal relationships.

Workload Pressure with Job Stress among Hospitality Internship Students

Workload refers to the concentration of job assignments. It is a cause of mental stress for employees. There are many causes of stress, but workload pressure was a primary cause. A survey by (Mensah, 2020) states that 60% of workers saiwork-related pressure has risen over the years. Workload pressure affects the internship student's performance. Poor mental concentration, lack of sleep, weariness, and psychosomatic issues are typical results of business-related pressure. Most students who do their internships in restaurants are willing to work long hours because of the environment. Students who work more than 8 hours are likely to be infected by tiredness which also affects their mood and behaviour, causing poor mental

focus ((Mensah, 2020)). Representatives with zero power over their work might encounter burnout because of the substantial workload.

Work Environment

The work environment is defined as the environment in which individuals work. The work environment is a scene or a physical workstation environment in which a set of people collaborate to achieve specified objectives. It can involve various factors, such as lighting, workspace design, temperature, and so on ((Robert I, 2017)).

According to (C.Visher, 2007), workplace stress is a feeling of comfort or mismatch between the employees working there with the physical work environment. Employees gain a feeling of mismatch when they discover the wrong environment and find it difficult to adjust and cope with it. Employees' loss of the ability to adapt is related to their ability to complete the job.

Job Stress among the Hospitality Internship Students

Stress is an active state of mind in which a human being faces both an opportunity and limitation (P.Robbins, 2010). Regarding internships, students may have helpless associations with their managers since they are somewhat new in the workplace. Likewise, reports showhat entry-level position understudies are being tormented off (Meulenberg, 2019). Since the internship students are recruited on a restricted time, an internship may give them additional responsibility just to exploit their time with them. The internship students probably won't have the opportunity and assets to play out their work well. This way, this could put them under stress. Factors like actual working conditions, errands (for example managing troublesome customers), and the measure of fulfilmenfrom the actual work are completely included (Tan, 2021).

Research Hypothesis

An experiment uses a hypothesis to define the relationship between two variables. The purpose of a hypothesis is to find the answer to a question. Based on the article that has been reviewed, the hypothesis of this study can be summarized in the following way:

H₁ There is a significant relationship between workplace environments towards job stress levels among hospitality internship students

H₂ There is a significant relationship between interpersonal relationships in the workplace towards job stress levels among hospitality internship students

H₃ There is a significant relationship between workload pressures towards job stress levels among hospitality internship students

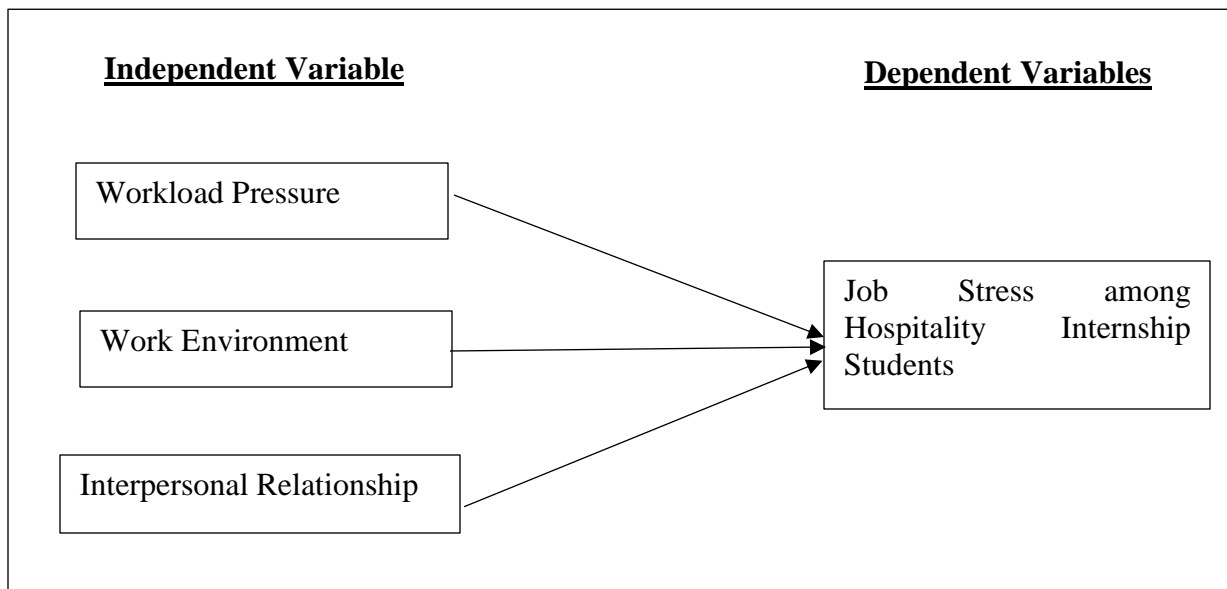
Research Framework


Figure 1 shows the research framework used for the study

Figure 11: Research Framework

METHODOLOGY

Research Design

A research design may be defined as a framework of methods or procedures selected by researchers to integrate various components in a research project. This research discusses job stress levels among hospitality internship students at University Malaysia Kelantan. This research used the quantitative method to gain all the data through a questionnaire. The Quantitative method is the process of collecting and analysing numerical data. The unit analysis is about the independent variable and dependent variable. Second, descriptive research can be used to gain through questionnaires and collect the data from respondents' data.

Data Collection

The questionnaire was used to collect data on the quantitative technique chosen for this project. This type of data collection needs people to respond to research-related questions conducted. This study was adapted from prior studies looking at the interpersonal relationships, workload pressure, work environment, and job stress level among hospitality internship students at University Malaysia Kelantan.

In this research, data collection was collected using Google Forms. This way, looks easy to obtain responses from respondents. The questionnaire was distributed to students undergoing practical training as well as persons who have completed practical training in the hospitality industry. This is because everyone is using a smartphone nowadays. Moreover, we are now in a situation Covid-19 pandemic, which requires that face-to-face contact be limited.

Sampling

In this study, a non-probability sampling technique which is convenience sampling, was selected due to the current situation. Convenience sampling is a technique where samples are selected from the population as it is conveniently available. Most internship students were kept in touch with their juniors, so the respondents were selected randomly as any hospitality internship students from UMK could answer the questionnaire given. The questionnaire is designed using Google Form and distributed throughout social media: WhatsApp, Instagram, Twitter, and Facebook. Using Google Forms and social media, the researchers could get more respondents.

Data Analysis

Researchers utilize the Social Sciences Statistical Program (SSPS) to analyse data for descriptive data. The Statistical Package for Social Sciences (SPSS) version 27 is a program

that uses descriptive analysis and correlation to describe the relationship between independent and dependent variables.

FINDINGS

Result of Frequency Analysis

Table 46:Demography Analysis

Characteristics	Frequency	Percentage (%)
Gender		
Male	96	54.2
Female	81	45.8
Age		
22-23 old	39	22.0
24-26 old	109	61.6
27 and above	29	16.4
Race		
Malay	98	55.4
Chinese	30	16.9
Indian	21	11.9
Others	28	15.8
Internship Year		
2017	16	9.0
2018	31	17.5
2019	26	14.7
2020	65	36.7
2021	27	15.3
2022	12	6.8

Table 1 shows the respondent's demography of the internship student-(1) Gender: 54.2% of the subject were male, and the rest, 45.8% were female. (2) Age: the leading group was 24-26 years old, making up 61.6%, followed by the 22-23 years old, with constituted 22%. (3) Race: Malay student was the leading group, taking up 55.4%, followed by Chinese student, taking up 16.9%. (4) Internship of the year, the year 2020 was the highest student (36.7%) and followed by the year 2018 (17.5%).

Result of Descriptive Analysis

Table 47: Descriptive Analysis

Variables	Items	Mean score	Standard Deviation
Work pressure	I have too much work assigned daily	3.42	0.980
	My work is highly repetitive and monotonous	3.56	1.027
	I feel excessive fatigue and tiredness due to heavy workload	3.56	.987
	I frequently have to work overtime	3.72	0.987

	My company not let me learn everything in the environment	3.52	1.082
Work environment	I always experience bullied in my workload	3.14	1.212
	I always feel uncomfortable in my workplace	3.41	1.120
	I have never been acknowledge and rewarded by the supervisor or management	3.56	1.054
	The staff like to make gossips in the workplace	3.61	1.045
	My workplace is crowded and unorganized	3.61	1.045
	The productivity of employee by work environment	3.77	1.038
Interpersonal Relationship	My colleagues do not show respect to me	3.10	1.088
	There is a lack of effective communication among members in our organization	3.57	.963
	There are lack of cooperative industry training	3.63	1.037
	Good mentor or supervisor make students into comfort zone.	3.67	.914
	There are organization where no friendly relationship among staff members, subordinated and superiors.	3.67	1.084
	Developing positive relationship at work should be rooted in dispositional	3.73	1.149
Job Stress among Hospitality Internship Students	I feel stress due to heavy workload during my internship	3.56	1.117
	I feel stress due to interpersonal relationship issues during my internship	3.77	1.049
	I feel stress due to the negative work environment during my internship	3.63	1.074
	I feel stress during my internship	3.79	1.081

The descriptive statistical analysis provided an understanding of the distribution of the primary attributes of the respondents. Table 2 shows the independent variable of work environment was the lowest mean value, 3.51, while the standard deviation was 1.085. The interpersonal relationship was the highest mean value, 3.56, while the standard deviation was 1.039. The work pressure was scored 3.55 mean value while the standard deviation was 1.010. The mean for the dependent variable of job stress was 3.68 and 1.080 for the standard deviation.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis

Table 48: Reliability Analysis

Variable	Number of Items	Cronbach's Alpha (α)
Interpersonal Relationship	5	0.836

Workload Pressure	6	0.829
Work Environment	6	0.919
Job Stress	4	0.917

The results of the reliability analysis are shown in Table 3. To measure the reliability of the questionnaire, Cronbach's alpha was applied to analyse the collected data. The results indicated that the Cronbach's alpha coefficient $\alpha = 0.836$ for interpersonal relationship, $\alpha = 0.829$ for workload pressure, $\alpha = 0.919$ for work environment, and $\alpha = 0.917$ for job stress. The surveys are highly reliable and can continue with the research because the Cronbach's Alpha value for the variables achieved 0.9. The respondents completed the questions satisfactorily, signifying that the questionnaires were acceptable for this study.

Result of Pearson Correlation Analysis

Table 4 shows the Pearson Correlation Analysis

Table 49: Pearson Correlation

Hypothesis	P-value	Result (Supported/Not Supported)
H₁:- There is a significant relationship between workplace environments towards job stress levels among hospitality internship students.	0.594	H₁ is supported
H₂:-There is a significant relationship between interpersonal relationships in the workplace towards job stress levels among hospitality internship students	0.794	H₂ is supported
H₃:-There is a significant relationship between workload pressures towards job stress level among hospitality internship students	0.619	H₃ is supported

Table 4 shows the result of the Pearson correlation analysis. The result indicated a moderate positive relationship between interpersonal relationships and job stress among hospitality internship students, with a coefficient of 0.594. While both significant values are .000. Consequently, hypothesis H1 is accepted. In addition, the study also showed a moderate positive relationship between workload pressure and job stress among hospitality internship students with a correlation coefficient is 0.619 while both significant values are .000. Consequently, hypothesis H2 is accepted. Furthermore, the study showed a moderate positive relationship between work environment and job stress among hospitality internship students. The correlation coefficient is 0.794, and both significant values are .000. Consequently, hypothesis H3 is accepted. All the result seems to be consistent that interpersonal relationship, workload pressure, and work environment infused job stress among hospitality internship students.

DISCUSSION AND RECOMMENDATION

This study produces another way by emphasizing research suggestions for how workload pressure, work environment, and interpersonal relationship affect job stress among hospitality internship students. The integrity of the respondent's responses to the questionnaire was challenged, resulting in invalid findings that should be eliminated from the research. Future research is advised to strengthen the study's accuracy by being more creative in obtaining data from respondents, such as in-depth interviews, to get reliable and thorough data. Thus, further study is suggested to explore the additional effects of institutions on internship satisfaction. Therefore, future researchers are encouraged to conduct more research by exploring other considerations such as supervision or academic support, which truly affect job stress levels from professional development and industrial perception.

This implies that ways to improve internship satisfaction may have both indirect and direct effects on student intentions; however, there are very few published studies on the issue. As a result, it is essential to conduct a study investigating the indirect impact of supervision support on internship satisfaction, such as longer intention in the hospitality industry. Thus, this research aims to produce valid data that will allow for more effective assistance from an internship in plans in the future and impact career perception for better contribution to scientific research.

CONCLUSION

In conclusion, this study evaluated how workload pressure, work environment, and interpersonal relationships influence stress among hospitality internship students. Three independent variables, namely workload pressure, work environment, and interpersonal relationships, have been chosen to examine their relationships with the dependent variable:job stress among hospitality internship students. A total of 177 respondents aged 23 years old and above were selected from University Malaysia Kelantan to examine their job stress among hospitality internship students. Based on Pearson's correlation analysis, the food workload pressure scored a value of *0.619, followed by work environment with *0.594, and interpersonal relationship with *0.794.

ABSTRACT

Ethnicity includes groups that differ by skin colour, language, and religion. Ethnicity is one of many factors that influence food choices. Ethnic foods are defined as foods derived from the traditions and culture of a particular ethnic group. Although modern technology is made chefs' work easy and timely, this research is more to gain the chef's acknowledgement of traditional food preparation. In line with this, therefore the qualitative research approach is used in this research. This research aims to look at the impact of modern cooking technology on traditional food. This study aims to discover the factors that influence modern cooking technology toward traditional food, such as taste, appearance and texture. These factors are vital in making modern cooking technology into traditional food.

Keywords: Modern cooking technology, traditional food, taste, texture and appearance

INTRODUCTION

Malay food has five characteristics: luxury with spices and herbs, one of the main ingredients is coconut milk, food is usually spicy, meat is usually stewed with thick gravy, and seafood is flavoured with turmeric powder. To make Malay traditional food, there is various terminology of cooking methods used in Malay cuisine, which are divided into dry heat method and moist heat method. For example, in the dry heat method, *menyangai* is a process that uses dry ingredients such as peanuts, dry-fried spices, or grated coconut without using oil in a small skillet or skillet over low heat (Ainuddin, 2013). Besides, the moist heat method is *menanak* which is a method of cooking rice in a pot (Alom et al., 2019).

Nowadays, the methods of preparing and cooking traditional Malay food have been transformed due to the introduction of modern cooking appliances, and the majority of chefs are no longer prepare and cook traditionally. On the other hand, traditional cooking utensils are nearly non-existent among chefs nowadays as more people choose to use contemporary cooking equipment like gas and electric stoves (Raji et al., 2017).

According to Kamaruzaman et al. (2020), many people in this day and age have lost the distinctiveness of the cooking skills and practices our forefathers passed down to us in Malay cuisine. Nowadays, the younger generation is giving up traditional Malaysian eating habits and replacing them with ready-made meals. It shows that switching and comprehensive information technology influences food intake and habits. Apart from that, the use of modern techniques helps Malay chefs adapt traditional cooking methods to the modern environment and cook more efficiently. Overall, it may be concluded that chefs' cooking skills in a traditional way may be deteriorating due to their over-reliance on current technologies. At the same time, contemporary technology has gradually supplanted traditional equipment while food preparation is getting significantly faster, more effective, and more efficient.

Therefore, this study aimed to investigate the impact of modern technology on Malay traditional food preparation and cooking processes among chefs in Malaysia. States below the three research objectives for this study:

1. To investigate modern cooking technology's effect on Malay traditional food preparation and cooking process.

2. To examine the differences in cooking methods while using modern cooking technology.

3. To identify the uniqueness of Malay food using modern technology.

Significant of the Study

This research was aimed to provide more precise information, and the reader can see how strong and effective the impact of modern technology can change the Malay traditional food cooking based on devising and cooking techniques.

This research can show modern technology has a good impact and awareness about outcomes based on three-factor: it gives a good effect on the sustainability of traditional Malay food that uses modern technology and can motivate chefs or food sellers to use modern technology to make perfect traditional Malay food, and the uniqueness of food still the same if using modern technology in the cooking process. This is important because it shows how far the effect of modern technology in the world today can make or change the Malay traditional food that chefs in Malaysia cook based on devising and cooking techniques.

Besides, the research can contribute to two main perspectives: academic and practical. These two perspectives are described how the research can give knowledge to students and lectures and affect the institution itself. The research can have a positive effect on the student to be more hard-working and explore more new knowledge. Academic research can also contribute some new ideas about how to overcome this problem based on topics that explain something very realistic nowadays.

Another else, practical knowledge also can contribute many benefits because it can create awareness in industry field such as foods preparation can more save time, the taste of food and beverages also can more delicious because use modern technology it can make various convenience foods plus modern cooking equipment that very needed in the cooking process right now (Raji et al., 2017).

LITERATURE REVIEW
Modern Cooking Technology
This ingenious device thawed, heated, and even cooked some food in a fraction of the time spent in the oven (BuildDirect, 2016). On the other hand, modern cooking techniques are more than just "better and faster heating methods." There are also odour control, smart timer and temperature control, gas and electricity efficiency, and induction stove. Food production and service encompass complicated procedures such as preparation, cooking, distribution, and serving, is undergoing a new revolution. Many of these operations are already routinely performed by robots, and in activities requiring speed, uniformity, cleanliness control, and high levels of repetition, they almost consistently outperform human workers.

Wide range of convenience foods as well as sophisticated cooking equipment can help speed up the cooking process. This is because 15 traditional Malay cuisine featured a variety of cooking methods, including *menumis* and *menyangai*. Those who like a fast and straightforward lifestyle will opt not to make Malay traditional food from scratch, and in the worst-case situation, they may choose not to cook Malay traditional food. "This technology includes additional ovens and ovens, rice cookers, frying pans, steamers, freezers, refrigerators, vents, grinders, food processors, toasters, chopsticks, bowls, pots, etc.". She explicit, "our festival delicacies are becoming easier to prepare".

Taste

Taste is the sensation of flavour perceived in the mouth and throat on contact with a substance. This is steady with (Goffard, 2005), who demonstrated in his book "The Language of East and Southeast Asia" that the Malay are generally provincial individuals who stay alive on fishing, cultivating, and rice creation. As indicated in their review fair and square of modification of ethnic local food in Sarawak, "the adjustment of food had caused many changes in their food tastes, readiness, parts, plans, systemic methodologies, and the surviving eating politeness and other related issues." Besides, (Engler-Stringer, 2010) expressed that globalization impacts changing assembling and handling strategies, the development of prepared handled/arranged food varieties, and an increment in take-out dinners are generally key motivations behind why tastes are changing (Lang and Caraher, 2001).

At the same time, it affirmed that deficient food practical abilities might hinder an individual's ability to deal with essential food tastes. Regardless, food varieties, such as living things, are touchy to changes. This technique concerns the actual supper yet in addition to its flavour. For instance, 'creolization,' which started with one food taste and advanced to at least two food tastes, set up another culture when they showed up in America (Diamond, 1997). Due to our country's bounty of neighbourhood assets, it is practical to make rich, delectable, novel, and remarkable cooking. " They probably won't have the option to differentiate among customary and Western-style blended food." The absence of inventiveness may be ascribed to the development of innovations and underlying changes in the arrangement of conventional Malay culinary preferences for inns

Texture

Texture definition is the feel, appearance, or consistency of a surface or substance. An exploration directed by (Manderson, 1981) on conventional food convictions and life occasions, which focused on the traditions of Malay townspeople in a couple of states in Peninsular Malaysia, found that the Malay individuals in the kampung still clutched customary thoughts and information. (Zahari, 2011), who explored Malay food courses in Malaysia, gave subsidizing to this review. The food practicality thought, which incorporates three viewpoints like, time, actual energy, and mental energy, makes a huge commitment to the change or modifications (Miller et al., 2007).

According to (Li et al., 2004), a couple of conventional food surfaces are on the edge of termination, even though modernizations benefits food businesses, especially in ruined places, and proposes that a more significant amount of them require some change with the current of the contemporary world. Be that as it may, they were thinking at it from the outlook of good eating rehearses. (Devine, 1999) commented on the progressions that have happened in food and beverages, which he viewed as one of the most confounded activities inside the lodging business. They are the method involved with ageing significantly, changing private home constructions, expanded female workforce interest and longer working hours, purchaser thriving and procedures proprietorship, a shift toward better eating, a craving for various disclosures, independence, contracting cooking abilities, the summary of conventional taking care of times, and sensible cost.

Appearance

Appearance is the way that someone or something looks such as the look of the Malay traditional food situation, style of devising the food, and so on that telling us about how the look can make it attractive. The impact on how the change and difference plus a lot of perspective and opinion about the modern technology used. However, the impact of modern technology can make Malay food have something lacking, especially in the aspect of appearance because appearance is essential to Malay traditional food. After all, it shows authenticity and uniqueness, but when convenience food has in hotel or restaurant nowadays it has a lousy effect on the appearance of Malay traditional food because the present day shows

people prefer convenience food compared to Malay traditional food and it because appearance, taste, ingredients, food preparation, cooking process and other else factor. For example, mixer and electronic equipment show in Malay traditional food using traditional equipment because they can give different appearances based on modern technology, cooking skill, and the taste of food.

However, The appearance of Malay food using modern technology is dishes or food that finish cooking can be served in large quantities because modern technology's function is to prepare food not only one person can eat, but more people can taste the dishes. It show the appearance of food that it can eat for small of the group and large of people can eat without waiting a long time. Exposure of the lot of modern technology and modern equipment can make people more demand about processing food. Based on the study from (Engler-Stringer, 2010), this is true because of modern technology and good cooking skill make demand for Malay food still exists today.

.

Research Framework

Figure 1 below shows the research framework for this study.

Independent Variables

- Taste
- Texture
- Appearance

**Dependent Variable**

- Modern Cooking Technology

Figure 12: Research Framework

METHODOLOGY

Research Design

Research design is a research program that sets out the methods that researchers must follow to achieve their research objectives or test the hypothesis they have created for their investigations. Study design is important to ensure that evidence obtained from data can clearly and convincingly answer the research question (Vaus, 2001). This study is qualitative and is based on the study of basic theory. Researchers who choose this research design will collect data through interviews, observations, record reviews or a combination of these methods (Norhisham, 2019). As a result, researchers seek to see if modern technology impacts traditional Malay food preparation and the cooking procedure among Malaysian chefs.

Sampling

Critical inspecting is utilized in our exploration to meet with culinary specialists in the inn. In our examination of the effect of present-day innovation on Malay customary food varieties readiness and cooking process among gourmet specialists in Malaysia, we will take meet a couple of respondents to get a little information. Our poll will be founded on our dependent variable, which is the effect of present-day innovation towards autonomous variable, which is taste, surface, and appearances of food sources. The course of our meeting with our respondents

will assist the analyst with getting some information that helped us complete the examination. The poll and the way will do is the method of critical testing and snowball inspecting, which is from the example in non-likelihood.

Data Collection

The research uses primary data for methods of data collection. Primary data is originally collected by researcher from the questionnaires for a project from first-hand sources or specific research purpose through various sources such as experiments, interviews, surveys and so on. The data collection method that suitable and easy to do is face-to-face interview with a hotel chef that prepared and cooked traditional foods. Face-to-face interview is a tool or method used in this research because it is the best way to reach the respondent, minimum cost, budget, safe time, and very accurate result.

A questionnaire is applied to gather information on the taste, texture and appearance based on the independent variable (IV). This questionnaire is based on our topic the effect of modern technology that in world today can make or change the Malay traditional food that chefs in Malaysia cook based on devising and cooking techniques. The questionnaires were distributed through face-to-face interview, collected data on selected chefs in this hotel, recoded the response, and the researcher duplicated manually duplicated the data. This is how to get the information and probably it did not lose the data and noted all the important information to put in the research and the meaning not change with the original meanings.

Data Analysis

Once the information and perspective about the research have been obtained from chefs, the information needs to be analysed to get detailed data about the modern technology that has greatly influenced the preparation and cooking processes of Malay Traditional foods. Since the data collection will be received through the recording of interviews, the first theming analysis is preparing and organizing the data. This process can be worked by transcribing the recordings into written form to facilitate analysis (Bailey, 2008). All audio recordings must be transcribed verbatim, no matter how easy to understand the transcript when it is re-read. Sutton & Austin (2015) stated that after all research interviews have been transcribed, checked, and explored the data, the next step to take is coding. The field notes gathered during the interview might be a great source of additional information to help with the coding process. This is because the period between the interview, transcription, and coding can produce memory bias in nonverbal contextual or environmental difficulties, which can alter data interpretation. Coding generally refers to the researcher's interpretation of subjects, issues, similarities, and contrasts indicated by participants' narratives.

Besides, defining and naming the theme is the next step of the theming analysis. In this step, the researcher needs to finalize the theme and rearrange the final definition to clarify the relationship (Michelle & Varpio, 2020). This procedure entails using the theme's labels and giving the theme a thorough name that reflects the relationship or meaning it conveys. As a result, each topic might be the title of a section in the report or presentation when the findings are collated for presentation. There will be a code for each topic, samples from the transcript and the researcher's assessment of the theme's meaning. Finally, the last step of the theming analysis is the researcher's need to produce a report. For this step, after the theme was defined and named, the qualitative researcher began writing the final report by presenting findings and data interpretations of the study. Braun & Clarke (2006) suggest that researchers need to state the meaning of each theme, the assumptions that support it and the consequences of each theme. Therefore, the final analysis should tell an overall story about what is revealed by the many themes of the research topic.

FINDINGS AND DISCUSSION

In this study the primary investigate is to seek the impact of modern technology on Malay traditional food preparation and cooking processes among Malaysian chefs who have been classified according to their age and occupation. This section is begins by presenting the

informants' profile and general knowledge about the impact of modern technology on Malay traditional foods preparation and cooking processes among Malaysian chefs, prior tobefore answering the study's objectives and questions based on the research findings. For this study, the researcher conducts interviews with a total of six informants. Six (6) informants participate in this study, which further enriched the data and provided additional information for discussion regarding their ethnic traditional food practices. The educational background all informants have finished their secondary level.

The following section describes and discusses general questions about the impact of modern technology towards Malay traditional foods preparation and cooking processes among chefs during the interview session. In this study, the thematic analysis is used, and it is a straightforward method that requires the researcher to examine the transcribed data and report on the themes that emergeemerging themes. As a result, the data in this study were able to determine the theme through the use of inductive reasoning. As a result, the three (3) general questions are as follows:

1. The authenticity of Malay food in restaurants with ready-made items and ingredients used in cooking. The authenticity is still maintained or changed because food like chicken rendang and chilli paste have chemical substances that change the taste of traditional foods. It cannot be called authenticity. What is your opinion, chef?

2. Modern technology cannot compete with the taste and aroma of Malay traditional food because of what? And modern technology in the cooking process and traditional food preparation is what the function to look Malay traditional food taste is still same or change because it more value if chef-prepared and cooked traditionally.

3. This research explains appearance, and based on the topic, the appearance mainly discusses traditional Malay foods look inside and outside, how the Malay traditional foods maintain and sustain their originality, heritage, and authenticity, and the probability of threats that come from modern technology impact. What is your opinion, chef, on how to maintain and sustain it?

The authenticity of Malay food is still maintained or change

The first question was about the authenticity of Malay food is still maintained or changed because of using ready-made items in the cooking process. The authenticity of food is in the way the cook prepares the cooking process. However, each state may have a different way to prepare this traditional dish. By using finished goods in cooking, the originality will change little from using raw materials like the traditional way. It also depends on the person preparing it. The chemicals used in the cooking will not change 100% and certainly do not override the originality of recipes such as rendang and so on.

> *If we use the original recipes and techniques that are traditionally practiced, the rendang cuisine can last for a week and can even last up to 2 weeks. However, if ready-made food items have been placed with preservatives that can affect the taste of Malay food from the original Malay food, then it cannot be called authentic Malay food but fusion. (Informant 1)*

The taste of traditional Malay food is still the same or changed by using modern technology?

The second question is whether modern technology cannot compete with the taste and aroma of Malay traditional food. Clearly, innovation in the production of appliances in the kitchen has many advantages. Among them is helping to ease the kitchen task and shorten cooking time. As a practitioner of Malay cuisine, some traditional recipes take a long time to complete. The way they cooked in ancient times was different. They used to cook using firewood instead of a gas stove like now. Nowadays a lot of processed foods are even easier and simpler to cook.

> *The taste of a dish will not change as long as we use the correct soup or standard operating procedure, which means the right ingredients, and the right taste it also depends on the person who cooks or the chef who uses modern technology. If he gets*

the right taste and aroma, he will not change unless the chef does not follow the original recipe, which means that the food will probably change. For example, nasi biryani will be nasi minyak because it does not follow the original recipe.
(Informant 5)

The way to maintain the heritage and authenticity of Malay traditional food

The questions posed clearly state that ingredients play a big role in ensuring that the authenticity of Malay traditional food can stay maintained. Food ingredients have useful functions in various ways such as flavor, mix, thickening and color, and have played an important role in highlighting the original taste of Malay food. The ingredients form part of the recipe and contribute to the special unique characteristics and taste of the food. Relatively speaking, tTraditional food ingredients are closely linked to tradition and nature and thus reflect a particular cultural identity.

Innovation and technology in cooking can help to simplify the cooking process and reduces time in the kitchen. Besides, using the selected ingredients can promise the production of healthy and safe food and maintain the food's appearance and originality. (Informant 2)

As a chef, use fresh and good ingredients such as garlic, ginger, onion and other items to ensure the food taste is maintained. And make sure the quantity was equal and same for every food that was made. This helps your food taste maintain the same taste as well (Informant 3)

The appearance of Malay traditional foods can sustain until now because of the development of modern technology?

Based on my opinion as a chef, I think the appearance of Malay traditional foods can sustain because of development of modern technology because modern technology can be used to produce or make Malay traditional foods. This is consistent with Redman's (2019) that saying modern technology and income level are something similar. When income level is high, automatically food practices can be the different, and the pattern of food consumption of people can influenced the appearance of Malay traditional foods. (Informant 5)

DISCUSSION AND CONCLUSION

Malay traditional food in the restaurant is done by using ready-made items in cooking. Therefore, the question is to identify whether its authenticity is still maintained or changed because foods such as chicken *rendang* and chilli paste have preservatives that might change the taste of traditional foods.

Authentic food is food (or drink) that does exactly what it describes, and what a person reasonably assumes about its character. Generally, the term authentic is used to describe an item that is not a fake or imitation but is genuine. Sims (2009) found that the authenticity of local food consumption can be three ways which are objective, constructive, and existential.

First, consumers consider local food authentic if it is locally produced or made. Next, the authentic relationship between food consumed and the place is socially built. Consumers feel the food is more authentic when there is unity between their expected typical food experience and their experience at a specific location, including the atmosphere, the environment, the food itself, and the heritage associated with the food. Lastly, working with local food also play an essential role in supporting authenticity by connecting consumers to places and people who make food. In other words, authentic Malay food is food that tastes the same as authentic Malay food. Therefore, the researcher conducts a theme analysis based on the aims and questions of the study to collect the results of these qualitative studies and then discusses them in this part. The first research question, which can be seen shown below, is used to kick off the conversation.

Discussion of Research Question 1

The results in research question 1 have shown that technology is having an effect on traditional Malay cuisine among chefs. In order to create a concept about this topic, the informants' ability to provide instances and descriptions linked to their traditional cuisine is essential. The results show that the chef still strives to prepare the old traditional recipes and ingredients rather than using ready-made goods to make your cuisine taste delicious. Even though the meal is served or available late, it is imperative that it be tasted and that more orders be placed.

Discussion of Research Question 2

Research Question 2 examines how meals prepared in contemporary and traditional ways have distinctively different flavours. Because in addition to that, contemporary technology makes use of a greater variety of chemical components to make traditional foods seem appealing. Because of this, the dish's flavour cannot be compared to the flavor of foods prepared with conventional components. The flavor of dishes prepared using ready-made ingredients may be outdone if we can employ more traditional ingredients in their preparation. Because of the equipment and the ingredients, modern technology will never be able to duplicate the authentic flavour of traditional foods. For instance, traditional cooking involves utilizing wood fire and taking your time.

Discussion of Research Question 3

The results show that the development of modern technology can maintain the appearance of traditional Malay food because the ingredients used to prepare food are the same. So, the appearance of food can also be maintained despite new technology. For example, we can take Nasi Lemak. It's old food and very popular in Malaysia. We can get the food anywhere. Even the modern technology has been made; the food taste remains the same. Not only Nasi Lemak but some other foods like Asam Laksa, all the taste is top-notch when they use more traditional ingredients.

Limitations and recommendations for future research

The first limitation identify is not every chef is using modern technology to produce traditional food. Secondly, some of the informants could not afford it contacted again and not everyone was able to meet face to face. Still, this study focuses on the impact of using modern technology on food among hotel chefs. This allows for a more thorough investigation of the effects of evolution and modern technology on traditional food preparation among chefs.

CONCLUSION

The conclusions based on the main topic that the researcher studied is the impact of modern technology on Malay traditional foods preparation and cooking processes among chefs in Malaysia. The traditional foods are basically from generation to generation, and people can notice it when a lot of information can contribute to making young generations didn't forget their origin. Thus, the research is basically to keep the impact still beneficial to the chef because Malay traditional foods preparation and cooking method actually give a lot of impact to Malay traditional foods and make it different right now because of current condition that makes it change. On the other hand, the researcher expects this study to be a meaningful reference for future studies focusing more on detail related to this topic. There is an abundance of division in the Malay cooking area that has not yet been covered. This study can be helpful to the next researcher because it can be the best reference for them to develop the new data and information and take our study as a reference and use it and do more research for the sake of public information. The development of modern technology is difficult to stop because it is based on trends and the current demand of customers themselves. Research is fun to do because it can get new knowledge and know more people. After all, the informer such as chefs, public people and so on can make a variety of data and use it as an idea to benefit people.

ABSTRACT

This study was conducted to determine the relationship between mental health and malnutrition among University Malaysia Kelantan city campus students. The primary purpose of this research is to investigate the relationship between lack of knowledge and malnutrition among university students in Malaysia Kelantan City Campus. The selected qualitative analysis approach and the data collection method used was a semi-structured personal face-to-face interview. The main source of data used in the data collection method for this research. Using purposive sampling or consideration, about ten students conducted a semi-structured personal interview, and five students were interviewed online, i.e. questionnaire. That way is very easy to distribute and collect data information from respondents. Amount respondents were about 15 students conducted in semi-structured interviews, personal and online surveys such as questionnaires. In this study, data were analyzed thematically. Thus, this study can help other researchers in the future come when they want to investigate the link between lack of knowledge and malnutrition among students of University Malaysia City Campus Kelantan

Keywords: Mental Health, Malnutrition, Lack of Knowledge, Among Student UMK

INTRODUCTION

The first chapter contains the study's background, problem statement, research objectives, research questions, the study's importance, and a summary. The study's backdrop includes the theories, concepts, words, and ideas of a topic or issue. A problem statement is a concise and straightforward statement that defines the symptoms of a specific problem that the researchers intend to investigate. (Mukesh Kumar, Salim Abdul Talib, & Ramayah, 2012). The study objectives are declarations of purpose or intended activities that can be defined as actions to respond to the given questions. Major broad inquiries might be supplemented with exploratory questions regarding research topics (Leon-Abao, 2014). Furthermore, the study's relevance might be described as the amount the researchers contributed to changing a notion, improving knowledge, or introducing a new theory in a particular field of study. The definition includes both independent and dependent variables terms.

Rapid economic growth and development are more common in developing countries. Developing nations, on the other hand, will impact the issue of nutritional status. The country's poverty level will determine this; when the country is poor, children in the city will suffer from malnutrition, but when the country is wealthy, children will almost certainly suffer from overnutrition, leading to obesity. Malaysia is one of the developing nations on the list, according to the International Society of Gynaecological Endocrinology (ISGE) (2018), yet it is a moderate country with malnourished people. People with malnutrition may be at a greater risk of getting coronavirus in Covid-19. Malnourished children still exist in Malaysia, and the country will only be able to meet one of the ten global nutrition objectives by 2025. One in every three Malaysians aged 16 and up have mental illness, according to the 2017 National Health and Morbidity Survey. According to Momina Abid (2018), the study's findings show a strong positive link between malnutrition and psychological discomfort, as well as a significant effect of malnutrition on psychological distress. This is because as the level of psychological discomfort rises, so does the risk of malnutrition. As a result, it impacts students, especially during the Covid-19 pandemic season, which is growing by the day.

The objectives of this research are:

1. To study the link between mental health and malnutrition among University Malaysia Kelantan City Campus Student
2. To explore the link between a lack of knowledge and malnutrition among University Malaysia Kelantan City Campus Student
3. To analyze the link between poor food consumption and malnutrition among University Malaysia Kelantan City Campus Student

Significance of the Study

Researcher

This research will assist a student in avoiding mental health issues, which are often the primary cause of malnutrition in students. Students with poor mental health may find it difficult to concentrate on their studies, leading to worse examinations scores and difficulties finishing theses. As a result, students should always be in a positive environment to counter this problem.

Study

This study intends to contribute to the body of knowledge regarding how malnutrition factors might arise among University Malaysia Kelantan students based on the findings of this research (UMK). Mental health, lack of education, and insufficient food consumption are some of the indicators that might suggest malnutrition among UMK students. As a result, diet is an important part of maintaining good health and avoiding sickness. Because students nowadays are unaware of such a circumstance, this study's findings will contribute to enhancing education in healthy and balanced food consumption. As a result, students are required to have sufficient information to consume a well-balanced diet that includes calories, fat, proteins, vitamins, and sufficient fibre to suit the body's demands.

LITERATURE REVIEW

Factor of Family Property

Family was the main supporter that always supported their child that continue study in finance. As we knew, after entering university life it costs a lot of money that consists of many aspects which also can be said that everything needs money. Examples include eating, writing instruments, college fees, and others. Due to financial problems, parents were not able to give their children, that still study to have healthy food (Azriff Zaim, January 19, 2022). The issue that appears from this matter is micronutrient. Those students with financial problems cannot get enough vitamins and minerals for their body, which may cause disease, and the effect that also may appear is weight loss. This issue critically encounters some students that have financial problems and affect them.

Factor of Knowledge About Nutrition Eating

Alongside in their university life where they only have limited time for their leisure time, many students still didn't take the knowledge of nutritious eating as a serious matter in their daily life. Due to that, they were exposed to the most unhealthy lifestyle which they only ate what they only wanted to survive a single day. As we know, students were more exposed to instant food instead of fresh food. It is where they were more love to eat something like instant noodles, fried chicken and many more. In this matter, it is happening because they have little knowledge about nutritious eating and instead of having a good meal, they only think about how to fill their tummy (Zaim, 2022). This has cause many issues among them like being overweight, which can expose them to heart disease, stroke, diabetes, and cancer. This matter may affect themselves and their daily life for the upcoming time.

The Eating Practice

The effect of unhealthy diet can be seen through the changes of the student body shape because there will be lot of changes that happen to the student's body neither skinny or obesity. Some of student didn't have a good eating practise in their daily life which may give effect tostudents didn't have a good eating practise in their daily life which may affect their body. In this matter, most of student especially girls were racing to have a good-looking body and to achieve that instudents, especially girls, were racing to have a good-looking body and to achieve that instant they were dare enough to take the risk by having a bad diet. For example, they throwing back the food they ate just because scare back the food they ate just to look fat. A bad diet habit can cause some issue where they were easier to get sick, stress, tiredness, depression and other because there was no nutrient that enter insides where they were easier to get sick, stress, tiredness, depression and others because no nutrient entered their body (Hindmarsh Square, 2022).

Food Insecurity Among UMK Students

Food is a requirement of daily human existence. Nowadays, the issue of food insecurity is very important to university students, which is produced from the factory and plays an important role for the public to feel safe by eating the food. As a result, that involved proper packaging methods and procedures in producing something good and safe food to eat. Food security is the availability at all times of the world food of sufficient, nutritious, varied, balanced and moderate basic food ingredients to maintain steady food expansion and balance fluctuations in production and prices.Besides that, food insecurity, or limited or uncertain access to sufficient food because of a lack of economic resources for food, is an underlying cause of poor dietary quality and is associated with acute and chronic health conditions like obesity, cardiovascular disease and diabetes as well as weakened physical health and compromised mental health status (Gundersen, 2018). According to the United States Department of Agriculture (USDA), the limitations or uncertainty of adequate and safe nutritional foods or the limited or uncertain ability to obtain acceptable food in a socially acceptable manner. For example, if a university student is stressed about completing an assignment given by a lecturer, he does not eat safe food because he wants to complete the assignment. In the research on university food insecurity, it is frequently stated that university students' experiences with food poverty differ from those of the broader community. If this is the case, we must assess food insecurity in a way that captures these diverse experiences or at the very least, permits researchers to create comparable food insecurity measures.

However, in 2018, 11.1% or 14.3 million households in the US, were classified as food insecure (Coleman-Jensen A, 2020). Food insecurity encompasses food acquisition problems, poor diet quality, and disrupted eating patterns resulting from a lack of resources (Coleman-Jensen A, 2020). Food insecurity impacts caloric intake and diet quality, as well as other aspects of the overall wellness of an individual.

Food security is more than an absence of hunger; it involves access, availability, and safety of food within the context of social acceptance of the processes for acquiring food. Nearly a billion people are affected by food insecurity around the world. Food security, according to the United States Agency for International Development (USAID), implies having physical and economic access to enough food to meet dietary needs for a productive and healthy life. In that case, we need to put it another way. Households can afford and receive enough nutritious food. A family is a food secure if none of its members is hungry or fearful of becoming hungry. For example, when students live in dormitories and are separated from their families, they will inevitably choose less food than healthy food. This will lead to unsafe food choices such as snacks and unhealthy foods.

Food insecurity is frequently linked to poverty in both the United States and developing countries. Changes in the global economy, such as increases in global food and energy prices, can significantly impact food security worldwide, particularly in low-income countries.

Food security is a worldwide issue as well as a domestic one in the United States. According to the United States Department of Agriculture (USDA), around 14.7 per cent of American families have low or deficient food security. In the United States, this translates to almost 50 million people, with about 17 million children. The Supplemental Nutrition Assistance Program (SNAP) is a federal programme that provides food assistance to low-income households in the United States in response to food insecurity (SNAP). This allows families to get electronic benefits from a debit card that they may use to buy bread, cereals, fruits, vegetables, meat, and dairy goods from recognised retailers. Food insecurity is a complex issue, according to extensive studies. Many people lack the financial means to meet their basic demands, putting their families in danger of food insecurity. Even though food insecurity is directly linked to poverty, not everyone who lives below the poverty line suffers from it, and people who live above the poverty line might also suffer from it. Food insecurity does not exist in a vacuum, as low-income families face a slew of obstacles, including a lack of affordable housing, social isolation, economic/social disadvantage due to systemic racism, chronic or acute health conditions, high medical costs, and poor salaries.

Loss of Appetite Among UMK Students

Firstly, we found that loss of appetite is one of the factors of malnutrition among university students. As we all know, this loss of appetite can happen to everyone regardless of gender, children, teenagers, and the elderly. Everyone will feel it, especially when they have a fever or severe illness. Loss of appetite is one of the things that everyone has ever experienced. But some conditions cause the appetite to disappear over a long period of time, causing complications to the patient. It can also accompany other symptoms such as the body becoming weak and weight loss. Loss of appetite (LOA) or anorexia is a condition of absence of hunger in patients. It can occur due to various reasons such as age, acute or chronic disease conditions, and associated medications. Loss of appetite can cause nutritional deficiency and lead to associated complications that can negatively impact a patient's health, overall well-being, and quality of life (Patel, 2017). Decreased appetite can also be caused by physiological factors, which cause a person to lose appetite for food. A phenomenon in society today is still found in a person who has a decreased appetite. so, others consider this a normal thing that can eventually lead to complications and disorders in the body and even lead to death if it lasts a long time and is not immediately addressed.

However, the mechanism driving these weight loss effects is unknown. Some studies suggest that the primary mechanism is decreased appetite. Limiting food intake to an 8- to 11-hour period during the daytime (Alom et al., 2015) and eating a large breakfast and small dinner decrease appetite and food intake in humans, with only one trial reporting an exception (Wehrens SMT, 2017) . Other studies suggest that the primary mechanism is increased energy expenditure. The many processes/mechanisms that underpin phenotypic behaviour could explain individual variances. The ability to self-regulate appetite, as well as the food choices and amounts connected with it, has the potential tocan alter an individual's response to an intervention. Furthermore, trends in specific population rates of obesity and risk transmission between generations imply that determinants do not occur in isolation, making susceptibility identification based on physiological, psychological, and social/environmental mechanisms critical to weight homeostasis success.

Appetite is the system that regulates energy intake (food consumption) and associated motivational states like hunger. Appetite is influenced by and interacts with energy expenditure. As a result, appetite is best understood in terms of energy expenditure (metabolic and behavioural) and should be regarded as part of an energy-balancing framework. Appetite is an

international academic magazine focusing on the cultural, social, psychological, sensory, and physiological factors of food and beverage choices and consumption. It includes studies of human and non-human animal behaviour toward food and covers both normal and disordered eating and drinking. This may occur because of the diversity of factors influencing appetite and energy intake (A. L. Pilgrim, 2015). Still, differences in individual characteristics and behaviours, including adiposity, sex, and habitual physical activity, may also modulate appetite responses to exercise. Given the importance of appetite and energy intake in energy homeostasis, an improved understanding of the key individual characteristics and behaviours that adjust appetitive measures after exercise has important implications for weight management.

METHODOLOGY

Research design

A qualitative research design method will be used in the research. Qualitative research evaluates complicated problems like people's attitudes, actions, value systems, culture, and way of life. As a result, such research can aid in the construction of comprehensive survey tools and the generation of hypotheses reported by (Hesamedin Askari Mjabadi, 2016) to discuss any correlations that could be investigated further in future quantitative research. A research design may be defined as a framework for conducting any research, and there are several sorts of research designs from which to choose and apply based on the research the researcher is conducting. Descriptive research, exploratory research, evaluation research, and explanatory research are examples of this sort of study design. The best research design that can be utilised and used to complete this research was descriptive research, according to the study, factor malnutrition among University Malaysia Kelantan, City Campus students that the researcher is researching. Descriptive research entails describing the study's population, setting, and phenomena. Descriptive research aims to figure out how, what, when, and where something might happen.

In addition, the researcher employed a questionnaire question method to finish the study on the factor of malnutrition among University Malaysia Kelantan City Campus students. This strategy includes implementing a platform that a researcher can utilise to collect data from other people. This method requires the people who are being picked and those who have the link to answer the question to answer a few questions.

Semi-structured interview

A semi-structured interview is the interview that uses the same question for all the respondents. The answer can be in the experience or the perception from the respondent. It can be collected with the researcher making the interview with the respondent and will collect the data from the fullyconducting the interview with the respondent and will collect the data from the full answer with the explanations and the opinion from the respondent.

Sampling

Sampling is a technique that allows researchers to infer information about a community from the results of a subset of the population without having to look into every single person. It's also known as selecting a subset of the population from which a generalization or inference about the full population is produced. Each of these main categories has a different number of sampling strategies.

The non-probability sampling method will be employed in this study. Purposive sampling or consideration, on the other hand, is an appropriate technique for this study. Purposeful sampling is a type of sampling in which the researcher selects respondents or members of the public to participate in the study based on their assessment. This is because the

study was limited to University Malaysia Kelantan, City Campus students. The student who usually don't take the proper diet in daily life are the among the respondent.

Sample size

The sample size is typically used in research to determine the number of persons participating in a study and can be classified as a population. The number of participants or persons from the population involved in the study is the sample size. The sample size is used to determine the sampling procedure employed in the study. Recently, the number of respondents has been suggested to 15 for theme approaches such as semi-structured personal interviews with closed questions posed to all interviewers, and the survey has been conducted the face-to-face interview. To make this study a success, the questionnaire questions were circulated using one by one to the interviewee.,

FINDING

Analysis of Theme 1

Table 1- Analysis of Mental Condition

Research Question	Respondent Answer	Thematic Analysis
What is the link between mental condition and malnutrition among university Malaysia Kelantan city campus student.	R1: Yes, it very important to human.	Mental Condition
	R2, R3,R4, R6, R7, R8, R11: Yes	
	R5, R9, R10: Very important	

Analysis of Theme 2

Table 2- Analysis of Lack of Knowledge

Research Question	Respondent Answer	Thematic Analysis
What is the link between malnutrition and a lack of knowledge among University Malaysia Kelantan City Campus students?	R11, R6, R2, R8 : Yes	Lack of Knowledge
	R4: NO	
	R7: Not often	
	R9: Yes, balance diet are important	
	R3: Yes, important to for human body	
	R1: Yes, because a balance diet is very important for health	

Finding of Theme 1

Table 3 below shows the result Finding of Theme 1

Table 3-Finding for Theme 1

Finding of Knowledge	Respondent Answer
Mental Condition	'Yes' All 11 respondents think that mental health and mental condition are important.

Finding of Theme 2

Table 4-Finding for Theme 2

Finding of Knowledge	Respondent Answer
Knowledge	'Yes' 9 respondents have knowledge and concern about well balance diet.

DISCUSSION AND RECOMMENDATION

The study recommends that the government give subsidised programmes and healthy food aid to impoverished students, such as food, healthcare, or water, to overcome the problem of student malnutrition. The university's administration should then organise a campaign to promote awareness among students about the necessity of leading a healthy lifestyle. This is because the pupils' health and food care level is very low, which might lead to malnutrition. By providing nutritious meals to students at an affordable price, the surrounding community may establish a better food system. As a result, students experiencing difficulties will not be burdened if the price is acceptable. Finally, students should be concerned about nutritional knowledge and make dietary improvements by choosing a more well-balanced diet that fulfils the body's needs. This is since students are less concerned about their regular diet. It takes a lot of self-control to be a student with an ideal figure.

CONCLUSION

To conclude, the focus of this study was to investigate the causes of malnutrition among students at the University Malaysia City Campus Kota. Furthermore, this work might be utilised as a reference by other students who want to undertake additional research on nutritional issues. As an outcome, it can be inferred that mental health, a lack of understanding, and insufficient food consumption are all contributorsto malnutrition among students at University Malaysia City Campus Kota. As a result, it is expected that all of the material presented throughout this research would assist other researchers in their future research.

ABSTRACT

Fast food is a mass-produced cuisine intended for commercial resale, with a significant emphasis on "speed of service" over other culinary science-related criteria. The objective of this study is to analyse fast-food consumption patterns and the impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). This study was conducted using a qualitative research approach. The data collection method used was an in-depth interview which the researcher conducted an interview online with open-ended questions asked to all interviewers through Google Meet. A total of 15 undergraduate students participants participated in this research. In this research, a non-probability sampling method will be used. Purposive or judgmental sampling is an appropriate technique for this research. In this study, the data were analysed by thematic analysis. In the findings, researchers chose respondent 10 for theme one and respondent 13 was chosen for these two.

Keywords: Fast-Food, Consumption, Pattern, Impact, Harmful

INTRODUCTION

Fast food has been gaining popularity and penetration into the food sector since the 1950s. Fast food is produced and served by restaurants or businesses with a significant emphasis on "speed of service" and is presented in well-organized packaging. Aside from that, the trend of needing to dine away from home is growing and becoming more evident. Fast food outlets are being established in more strategic areas, such as universities, medical centres, petrol stations, malls, and terminals (Ismail, 2016). Burgers, pizza, and fries are examples of fast food, as is any meal whichany meal that can be cooked speedily and sold cheaply. Even though practically every consumer is aware of the health risks associated with fast food, they continue to observe customers flocking to fast food outlets in a continuous stream (Alom et al., 2016).

Foods by nationwide fast-food franchises, including McDonald's, Domino's Pizza, Subway, Burger King, Pizza Hut, Kentucky Fried Chicken, and Taco Bell, is referred to as "quick food." However, they can also refer to as dining in. The students attach to fast-food always, additives, obesity, low nutritional value, and high calories. It is currently common sense that fast food is harmful to body fitness among students. A study of "Local Concentration of Fast-Food Outlets Is Associated with Poor Nutrition and Obesity" results that those habits are "at higher risk for adverse consequences of poor nutrition due to the patterns in local fast-food availability, which may restrain the bonanza of nutrition promotion efforts" (Yuchu Song et al., 2016).

The success of fast food is evident in society's deep interest in the consumption of fast food. Based on research conducted, attending by students on their food intake is very important, because it affects the students' physical and mental development, which is regarded as an important asset in advancing human resources. As students' day to day schedule is rather hectic due to packed class schedules and back-to-back assignments, students end up eating on the go than eating clean, opting for fast food as it saves their time and simplifies their lives (De Piero et al., 2015). They can easily infiltrate foreign markets using various ways of globalization strategies.

This chapter begins with an introduction to chapter 1 and then explains the background of the study. Furthermore, chapter 1 also discusses the problem statement in the chosen topic and why this research must be conducted. Besides chapter 1 also explains and discusses the research questions and objectives. Next, this chapter will continue with the scope of the study, the significance of the study and the structure of the report. Lastly, chapter 1 will end with a summary.

This study aims to examine the fast-food consumption pattern and impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). The objectives of this research are:

1. To analyse the fast-food consumption pattern among students in Universiti Malaysia Kelantan (Campus Kota).

2. To analyse the impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota).

3. To suggest recommendations on food consumption patterns among students in Universiti Malaysia Kelantan (Campus Kota).

Significance of the Study

University Students

This initiative at Universiti Malaysia Kelantan (Campus Kota) aims to improve students' understanding of the impact of fast-food consumption. The significance of a healthy diet in one's mental and physical well-being cannot be overestimated. A balanced diet and regular eating habits should be encouraged in a student's daily life. Even if a student must eat healthy food in a restaurant, they must be aware of food quality and consume a well-balanced diet. This study will guide students in Universiti Malaysia Kelantan (Campus Kota) to know more about the pros and cons of fast-food consumption if taken in excess. This is because students will be more aware of the frequent consequences of eating fast food. This is especially significant for Universiti Malaysia Kelantan (Campus Kota) students, who have a wide variety of fast-food outlets and restaurants close to campus.

LITERATURE REVIEW

Fast Food

Fast food is known to be a frequent choice, easy for customers, delicious, and affordable in price (Xiao Yang & Iqbal, 2018). Fast food is also defined as food that is easily purchased on a self-service basis or runs in a dining place with no waiting service. Fast food is a staple of the American diet and has been linked to excessive calorie consumption and poor diet quality (Fryar et al., 2018). Fast-food consumption has become a global phenomenon. Fast food, such as hamburgers, French fries, and pizza, is often made ready rapidly, ordered in self-service from eateries using precooked components, and provided in original packaging to the consumer for take-away. Fast food became famous in the 1970s in the United States, which now possesses the world's largest fast-food sector.

Fast food is food that is low in nutrients (Jones, 2021). Fast food has a high number of calories, sugar, and fat (Xiao et al., 2018). Furthermore, fast-food items produced with food cooked outside the residence had much more calories, were greater more significant in saturated and trans fats, and they were less in dietary fibre, calcium, and iron than meals cooked at home (Nora A. ALFaris et al., 2015).

Types of Fast-Food

The fast-food industry in Malaysia consists of various fast-food outlets that offer a variety of dishes or meals, from local to international products (Xiao et al., 2018). Fast food products use appropriate marketing to attract buyers. In a developing country like Malaysia, advertising plays a vital role in helping the country's economy (Shari et al., 2016). In Malaysia,

MacDonald's and KFC are high-demand fast food. Fast food is usually referred to as a hamburger, pizza, French fries, noodles, taco, hotdog, or any food that can be prepared and served faster at a low price. Kentucky Fried Chicken (KFC), Pizza Hut, Kenny Rogers Roasters, A&W, McDonald's, Burger King, Domino's Pizza, Secret Recipe, Wendy's, Subway, Taco Bell, and others are included (Bustamam et al., 2021).

Harm Of Fast-Food Consumption

Fast food harms the body's fitness among students (Bustamam et al., 2021). Uncontrolled consumption of fast food will lead to various forms of the disease. The disease can be found in the short term and long term. Fast food expires quickly, causing a rapid increase in blood sugar due to refined carbohydrates and added sugars (Jones, 2021). Fast food causes a huge insulin surge, resulting in a drop in blood sugar. This situation will cause students to get tired quickly and interfere with their learning process (Fuhrman, 2018). Fast food also has a high salt content (Wahab, 2020). The high salt content can produce high blood pressure in the body. Fast food contains a very high-calorie content. If a person eats high calories and does not exercise, it leads to weight gain and is at risk of getting obese (Jones, 2021). At the same time, obesity leads to other body diseases (Saifullah, 2016). Among them are diabetes, heart failure due to obstruction, polycystic ovarian syndrome, impotence, and fatty liver. In addition, fast food causes tooth decay, often consuming foods or drinks that are attached and old to the teeth, such as ice cream, honey, sugar, soda, dried fruit, cakes, biscuits, dried cereals, and chips (Bahari, 2020). According to a survey from Harvard University, young men whose eating patterns are a lot of fast food tend to have fewer sperm counts. It also has the potential to make a man infertile or impotent. This problem will lead to stress for men when it happens to themselves (Matthews, 2019).

METHODOLOGY

Research Design

This research used qualitative research to know the fast-food consumption pattern and impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). Qualitative research is used to understand better people's viewpoints, ideas, attitudes, and real-life circumstances and to generate theoretical approaches to those personal experiences (Holloway & Galvin, 2016). Applying qualitative research approaches and techniques has several advantages.

Secondly, the phenomenological studies research design was used to know the impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). Phenomenology is the study of how people perceive their surroundings (Dr. Sadruddin Qutoshi, 2018). Phenomenological studies investigate personal views based on the explanations they give. These would be referred to as "lived experiences" (MaryAnn Demchak et al., 2019). Phenomenological studies research seeks to comprehend issues, concepts, and circumstances from the standpoint of shared comprehension and endurance rather than from the standpoint of disparities.

Data Collection

In this research, the data collection method used is an in-depth interview consistent with open-ended questions asked to all interviewers through Google Meet. In this study, 15 students conducted an in-depth interview. According to M. Rosenthal (2016), in-depth interviews entail using open-ended questions and follow-up inquiries to learn more about the participants' experiences, perspectives, opinions, feelings, and expertise. The questions in the interview guide cover the subject which helps in obtaining fast-food consumption patterns among students in Universiti Malaysia Kelantan (Campus Kota) and the impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). Because of the Covid-19 pandemic, the approach employs in-depth interviews online in this study.

Researchers utilise in-depth interviews online to lower the danger of Covid-19 because of the pandemic.

Sampling

In this research, a non-probability sampling method will be used. At the same time, purposive or judgmental sampling is an appropriate technique for this research. The purposive sampling technique is sampling in which the researcher relies on judgment when selecting respondents or members of the population to participate in the study (Pernecky, 2016). The data for this study will be collected in the Universiti Malaysia Kelantan (Campus Kota) at Pengkalan Chepa, Kota Bharu, Kelantan. Respondents range in age from the first to the fourth year of study. Next, all the faculty students at Universiti Malaysia Kelantan (Campus Kota) are the target population. The number of respondents was limited to 15 students for the data collection technique in-depth interview, in which the researcher will conduct an online interview with open-ended questions to all interviewers through Google Meet.

Data Analysis

Through in-depth interviews, researchers used thematic analysis to analyse the fast-food consumption pattern and impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). The researcher collects data through the in-depth interview, which is conducted online with open-ended questions. Theme analysis summarizes and collects general observations and impressions of the subject, along with explanations and text comments to support them (Kimberly A. Neuendorf et al., 2018). The 6-step method (Braun and Clarke, 2006) is used. This was a method for finding, analyzing, organizing, summarizing, and interpreting ideas in a set of data (Braun & Clarke, 2006). In addition, the subject analysis examines four areas. The first area contained demographic questions and was created to gather basic information about respondents, such as their background. Section B describes the fast-food consumption pattern among students in Universiti Malaysia Kelantan. Section C describes the impact of fast-food consumption among students in Universiti Malaysia Kelantan, and Section D describes recommendations on food consumption patterns among students in Universiti Malaysia Kelantan (Campus Kota). The questions were written in a multilingual language to ensure that respondents understood the study questions and responded appropriately.

FINDINGS

Analysis of Theme 1

Table 1 below shows the result Analysis of Theme 1

Table 1: Analysis of Theme 1

Research Question	Respondent	Theme
What do you know about fast-food consumption? And why do you consume fast food (pattern)?	**R1:** Fast food is preferred by people for a variety of reasons, including convenience, flavour, and enjoyment. Fast food is prepared quickly and moderately inexpensive. **R2:** Fast food is usually referred to as a hamburger, pizza, French fries, noodles, taco, hotdog, or any type of food that can be prepared and served faster at a low price. Fast food is easily accessible for customers and delicious.	Fast-food consumption pattern among students.

	R3: Fast foods are simple to prepare, easy to procure, reasonable price, and enjoyed by people of all ages. Fast food is known to be a frequent choice, affordable price and due to the promotion.	
	R4: Fast food that is easily purchased on a self-service basis or runs a dining place with no waiting service. Fast food is inexpensive, convenient, and tastes good.	
	R5: Fast food is any meal that can be cooked speedily and sold cheaply. Fast food is provided in original packaging to the consumer for take-away.	
	R8: Fast food is any meal that can be cooked speedily and sold cheaply. Students choose to consume fast food since it is inexpensive, tasty, and simple to buy and consume. Fast food is known to be a frequent choice, easily accessible for students, delicious and reasonable price.	
	R9: Fast foods are prepared and served faster at a low price. Fast foods are simple to prepare, easy to procure, reasonably priced, and enjoyed by individuals of all ages.	
	R10: Fast food is any meal that can be cooked speedily and sold cheaply. Secondly, fast foods also are simple to prepare, easy to procure, reasonable price, and enjoyed by people of all ages. This could come from various eateries, including those with table service, quick service, takeaway, drive-thru, as well as delivery. Fast food also is known to be a frequent choice and delicious. Students are easily attracted to buying fast food by looking at packages and advertisements before trying the taste through handphones and fast-food applications. Moreover, fast food is provided in original packaging to the consumer for take-away.	

Analysis of Theme 2

Table 2 below shows the result Analysis of Theme 2

Table 2: Analysis of Theme 2

Research Question	Respondent	Theme
What is the impact of fast-food consumption?	R1: Fast food intake will get the risk of getting various forms of diseases such as high blood pressure, obesity, and overweight. Fast food leads to weight gain. Excessive saturated fast-food	Impact of fast-food consumption among students.

| | intake throughout teenage may damage cognitive abilities in maturity.

R2: Fast food is bad for our body because we will get kidney disease and cancer whenever eat more fast food, especially late at night. We get non-alcoholic fatty liver disease. Fast food will impact students to get tired quickly and interfere with their learning process.

R3: Fast food is bad for our body because we will get stroke and cardiovascular diseases whenever consume a lot of fast food regardless of time. We get atherosclerosis diseases such as coronary artery disease. The impact of tooth decay and cavities from fast food will make students less confident when confronted by classmates or they speak in public.

R4: Fast food is bad for our body because we will get chronic diseases such as osteoarthritis. Fast food is harmful to the fitness of the body among students. Students sleep less than 10 hours a day whenever consumed more soda beverages.

R5: Fast food is bad for our body because we will get diseases such as heart failure due to obstruction. Young men whose eating patterns are a lot of fast food tend to have fewer sperm counts. Fast food might harm the developing brain if taken for a longer length of time.

R6: Fast food is bad for our body because we will get diseases such as obesity, diabetes, and polycystic ovarian syndrome. Fast food which high salt content can produce high blood pressure in the body. Fast food can lead to sudden weight gain and risk of obesity and diabetes. Students have this disease; it will disrupt their learning system.

R7: Fast food is bad for our body because we will get the risk of getting various forms of diseases such as heart attack, obesity, and stroke. We get a higher risk of noncommunicable diseases such as hypertension. Fast food can lead to getting stress at a high level and a lack of concentration whenever lecturers teach.

R8: Fast food is bad for our body because we will get various diseases such as allergies, obesity, heart disease, blood pressure and kidney disease. | |

We will get chronic fatigue and insomnia whenever eat a lot of fast food such as burgers, hotdogs, fried chicken, and French Fries. Fast food can lead to getting depression, and anxiety. Students get tired quickly which interferes with their learning process.

R9: Fast food is bad for our body because we will get various diseases such as obesity, cardiovascular diseases, metabolic syndrome, heart attack and cancer. We will get gastrointestinal problems such as constipation, diarrhea, and acid reflux. Fast food can lead to increased headaches and migraine frequency whenever they study. Students have this disease; it will disrupt their learning system.

R10: Fast food is bad for our body because we will get diseases such as for overweight, obesity, several malignancies, heart failure and impotence. We get tooth decay. This is because there is an intake of soda content found in fast food ingredients. The carbohydrates and sugars in fast food can cause tooth decay. It will make students less confident when confronted by classmates, shy and stressed.

R11: Fast food is bad for our body because we will get diseases such as obesity, diabetes, stroke, and cardiovascular diseases. We get a higher risk of metabolic syndrome, non-alcoholic fatty liver disease and heart disease. Fast food intake can reduce students' productivity while studying as excessive saturated fast-food intake throughout teenage may damage cognitive abilities in maturity. It will disrupt their learning system.

R12: Fast food is bad for our body because we will get diseases such as obesity, overweight, cancer, osteoarthritis, heart attack, diabetes, and tooth decay. We get chronic inflammation such as body pain, weight gain, and arthralgia. We will be sleeping and getting the risk of memory problems.

R13: Fast food intake will get the risk of getting various forms of diseases such as high blood pressure, obesity, overweight and diabetes. We get stroke and cardiovascular diseases such as kidney disease, metabolic syndrome, and cancer. We also get diseases such as heart failure due to obstruction, polycystic ovarian syndrome, and impotence. We also get a higher risk of

| | | noncommunicable diseases such as hypertension whenever students frequently eat fast food such as McDonald's. Fast food is also harmful to the fitness of the body among students. Students have this disease; it will disrupt their learning system. Fast food might harm the developing brain if taken for a longer length of time, students get tired quickly and interfere with their learning process. Fast food also can lead to getting depression, anxiety, headache, and migraine frequency whenever we study. We lose our concentration whenever lecturers teach and not finished our assignments. Finally, our exam result scores also will go down.

R14: Fast food intake will get the risk of getting various forms of diseases such as obesity, kidney disease, diabetes, and high blood pressure. We get an atherosclerosis disease, shortness of breath, and angina which means chest pain caused by the reduced blood supply to the heart. Students sleep less than 10 hours a day whenever consumed more soda beverages such as Coca Cola and Sprite. This is because students cannot concentrate in class during lecture teaching so they will sleep.

R15: Fast food is bad for our body because fast food intake will get various diseases such as overweight, obesity, cancer, high blood pressure, teeth will decay and a high risk of heart disease. The body increases the risk of breast cancer, get loss of appetite, digestion, insomnia, and a high risk of sleep disorders. Fast food will cause students to get tired quickly, stressed, and tension. This is because students cannot concentrate in class during lecture teaching so they will sleep and not come to school regularly. | |

Findings of Theme 1

Table 3 below shows the result Findings of Theme 1

Table 3: Findings of Theme 1

No	Findings of Fast-food consumption pattern	Interview's Transcription
1.	Fast-food consumption pattern among students	*Respondent 10, 23 years old, an Indian female from faculty FHPK 3rd year. Yes, I know about fast food consumption. The fast-food consumption pattern among students in Universiti Malaysia Kelantan (Campus Kota) is any meal that can be cooked speedily and sold cheaply. Secondly, fast foods also are simple to prepare, easy to procure, reasonable price, and enjoyed by people of all ages. This could come from various eateries, including those with table*

| | | *service, quick service, takeaway, drive-thru, as well as delivery. I consume fast food (pattern) because fast food also is known to be a frequent choice and delicious. Students are easily attracted to buying fast food by looking at packages and advertisements before trying the taste through handphones and fast-food applications. Moreover, fast food is provided in original packaging to the consumer for take-away. The types of fast food available near the Universiti Malaysia Kelantan (Campus Kota) which I eat frequently are McDonald's, Eddlee Fried Chicken, Secret Recipe and Pizza Hut within 6-8 times per month.*

We chose respondent 10 because this respondent answered the question more accurately and clearly. She knows well a lot about fast food consumption patterns among students and she also answered all questions about this theme with confidence. She's a very clever and brave girl. We gain a better grasp of she's opinion and experiences through in-depth interviews. We are acquiring a deeper understanding of this respondent 10 and learning more from this respondent. That's why we choose this respondent 10 to do the findings. |

Findings of Theme 2

Table 4 below shows the result Findings of Theme 2

Table 4: Findings of Theme 2

No	Findings of Impact of fast-food consumption	Interview's Transcription
1.	Impact of fast-food consumption among students	*Respondent 13, 23 years old, a Malay female from faculty FHPK 3rd year. Fast food is bad for our body because fast food intake will get the risk of getting various forms of diseases such as high blood pressure, obesity, overweight and diabetes. Secondly, we get stroke and cardiovascular diseases such as kidney disease, metabolic syndrome, and cancer. The effect of fast-food consumption on our body is we also get diseases such as heart failure due to obstruction, polycystic ovarian syndrome, and impotence. We also get a higher risk of noncommunicable diseases such as hypertension whenever students frequently eat fast food such as McDonald's. Fast food is also harmful to the fitness of the body among students. Fast food intake can reduce students' productivity while studying as students have this disease; it will disrupt their learning system. Fast food might harm the developing brain if taken for a longer length of time, students get tired quickly and interfere with their learning process. Fast food also can lead to getting depression, anxiety, headache, and migraine frequency whenever we study. We lose our concentration whenever lecturers teach and not finished our assignments. Finally, our exam result scores will go down.* We chose respondent 13 because this respondent answered the question more accurately and clearly. She better understands the impact of fast-food consumption among students in terms of viewpoints students, attitudes, students' real-life circumstances, and personal experiences. She also answered all questions about this theme with confidence. She's a very brilliant girl. We gain a better grasp of she's opinion and experiences through in-depth interviews. We are acquiring a deeper understanding of this respondent 13 and learning more from this respondent. That's why we choose this respondent 13 to do the findings.

LIMITATION AND RECOMMENDATION

Researchers cannot manage specific parts of research due to limitations. Among them, researchers have difficulty conducting face-to-face in-depth interview sessions with respondents because of the COVID-19 pandemic. Due to the pandemic of Covid-19, most students are still studying online learning sessions in their homes. Therefore, the in-depth interview sessions were conducted online using applications such as Google Meet. Some things interfere with the in-depth interview session because some respondents have a poor internet connection. Interference like this makes data or answers challenging to record because the screen display stops, and the voice is not clear. At the same time, limited time is one of the challenges that researchers have faced while conducting this research. In-depth interview

sessions also experienced limited time as researchers and respondents were busy with studies, coursework of each subject and online learning with a tight schedule. This is because it very difficult for researchers to get time from respondents to interview them. Moreover, the lack of previous studies on qualitative methods in fast food consumption among students also caused researchers to have difficulty obtaining additional information.

The recommendations on food consumption patterns for students are first, every day we eat food, we should follow the Malaysian food pyramid 2022. For example, we must consume accordingly Pinggan Sihat Malaysia #SukuSukuSeparuh which contains palm size protein, sufficient size of fresh vegetables and fruits and grip size of carbohydrate. Every day, students must consume more than enough fresh fruits and vegetables. Furthermore, students should consume protein foods, such as fish one serving, chicken/eggs/meat 1-2 servings, legumes (soybeans, lentils, white beans, split peas, and kidney beans) 1 serving, milk and milk products two servings per day. Moreover, students must drink plain water 6 to 8 glasses per day to improve blood circulation.

CONCLUSION

In conclusion, this study has discovered fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). A total of 15 students from the age of 23 years old were selected from Universiti Malaysia Kelantan (Campus Kota) to analyse fast-food consumption patterns and the impact of fast-food consumption among students in Universiti Malaysia Kelantan (Campus Kota). Researchers conclude that the University can give some proper awareness to students in Universiti Malaysia Kelantan (Campus Kota) about the dangers of consuming fast food frequently. Researchers have explained many fast-food consumptions pattern, the impact of fast-food consumption and recommendations on food consumption patterns in this research. We hope the findings of this study are helpful for future researchers. This will lead to enough sources and ideas for future researchers about this research.

ABSTRACT

This study was conducted to examine the misuse of the halal logo in a restaurant in Seremban, Negeri Sembilan. The misuse of the halal logo happens when there has an irregularity or not by the rules set by halal from the Islamic Development Department (JAKIM). Many issues occur in the misuse of this halal logo among entrepreneurs who open a business. The study conducted has three research objectives which are first to explore halal logo regulation and requirements in Malaysia. The second objective is to identify how far restaurants in Seremban follow the compliance on using halal logo and propose recommendations and suggestions in the future. The researchers choose one data collection method: conducting online survey using semi-structured interviews. The questions prepared in the google form will be sent via WhatsApp to the restaurant. The researcher analysed the data using thematic and related with two themes: knowledge and regulation. Next, the researcher makes a recommendation for the future. In findings, the researcher had chosen two respondents from each theme that had related answers for this research study's research objective. The researcher s implications for conducting the research and collecting the data because facing a limited time, trust issues and limited respondents for this research.

Keyword: Misuse Halal Logo, Halal Logo, Restaurant, Knowledge, Regulation,

INTRODUCTION

The halal logo can provide benefits and positive development for Muslims in Malaysia. Halal certification is a guarantee toguarantees consumers to buy and consume food products (Alom et al., 2019). Many cases involve violations of the halal logo, such as irresponsible managers deliberately using certification by using the halal approval granted by producing products that do not follow the prescribed halal certification rules. The existence of the halal logo causes all matters related to the halal logo to be determined by JAKIM, and this task is given entirely by the community to JAKIM. The knowledge that exists in the community about the importance of the halal logo is still low and not emphasized by the community.

Based on the survey, the main challenge for the halal industry is that the businesses misuse the halal logo. Even though there are still good and accurate law enforcement implemented by JAKIM, there are still some entrepreneurs who misuse the halal logo. Halal logos are victims of counterfeiting and misuse, especially among businesses that want high profits.

The study aimed to analyze the misuse of the halal logo in restaurants in Seremban, Negeri Sembilan. Misuse of halal logos can be identified in several forms, namely forgery of logos, use of unrecognized halal logos, use of expired logos, and several other cases of abuse. Although However, JAKIM has made various ways to provide exposure on to the use of a goodn excellent halal logo. The owner restaurant needs to look at this matter properly as the use of the wrong halal logo will give confusion inrestaurant owner needs to look at this matter properly as using the wrong halal logo will confuse society. They should be more responsible to encounterfor encountering this issue.

There are three objectives of this research:

1- To explore halal logo regulations and requirements in Malaysia.
2- To identify how far restaurants in Seremban follow the compliance on using a halal logo.
3- To propose to recommend and suggest in future.

Significance of the study

Significance This study is about the misuse of halal logos in restaurants in Seremban, Negeri Sembilan. Respondents for this study are entrepreneurs in Seremban who own restaurants. This study was conducted on the owner and staff to answer questions. This research study will also benefit entrepreneurs on the importance of halal logo compliance in the field of food. In addition, this study will help entrepreneurs improve the use of halal logos so as not to get caught up in the misuse of this halal logo. This research study will also help customers not to be easily fooled by the misuse of this halal logo. This is because there have been many misuses of the halal logo. Also, just because there were so many cases of halal abuse at the time, it was difficult for consumers to know whether the food was genuinely halal or not.

LITERATURE REVIEW

Halal

In Arabic, Halal can be defined as legal or permitted (Hasan & Hanif,2017). Two parties handling halal certification in Malaysia which is Jabatan Kemajuan Malaysia (JAKIM) and Jabatan Agama Islam Melaka (JAIM) (as cited in Shafiq et al., 2014) owner business needs to get halal status from JAKIM to ensure their consumer trust to buy the product or food. There is some owner business that do not have a halal certificate, but they print out the fake halal certificate and paste it on the wall. The purpose is to make their customer trust their premises and feel safe eating at their premises.

Halal logo

The halal logo should use for the premises, or food that got the halal certification by JAKIM. In Malaysia, if JAKIM gives a halal logo to the owner business, it means their business complies with the Syariah that has been set out by JAKIM (Hasan & Hanif, 2017). Once the owner business gets the halal logo from JAKIM, it is necessarily displayed on the premise or in food packaging. It also means that the premises can legally use the logo in their premise and packaging products (Majid et al., 2015).

Misuse Halal Logo

Jabatan Kemajuan Islam Malaysia (JAKIM)'s halal logo is one of the symbols of halal compliance known worldwide (Majid et al., 2015). Some issues have related to the misuse halal logo. Jabatan Kemajuan Islam Malaysia (JAKIM) has conducted 740 inspections in restaurants for halal logo compliance, with 308 premises complying and 432 premises failing to meet the requirements of the halal logo (Halim et. al 2019).

These premises are not responsible for halal logo because they did not follow the compliance that need to be followed before opening the premises. Another issue that related to the misuse of the halal logo is premises did not ever apply to the registered halal logo. This will lead 21 the irresponsible owner business to take advantage of the issues arising to produce fake halal logos on the premises or on food packaging.

Restaurant

The restaurant is a place that provides food and beverage to other people, and it will receive many customers in that place. Muslim people need to choose halal restaurants to compare to the non-halal restaurant to buy food. The owner of Halal restaurant should be concerned about halal logo because many Muslim people will choose halal restaurant. There are a lot of issues related to the halal logo and restaurant. This is because some restaurant owners still exploit usage of the halal logo in their premise (Razali et al.,2017).

METHODOLOGY

Research Design

A "deep understanding of the particular" is one of the goals of qualitative traditions (M. Haradhan, 2018). Qualitative research can use data from document extracts and interviews

(Merriam, 2009). Besides, doctrinal methodology refers to a method of legal study that is commonly thought of being standard. The case law and other legal sources will focus on a doctrinal report.

Data Collection

The researcher use an online survey, which is Google form, and the questionnaire will be sent as an attachment on WhatsApp to the respondent. Close-ended and open-ended questions will be used for semi-structure interviews. There are significant differences between open and closed-ended questions, which limit the respondent's options. The researcher will give the open-ended questions to allow the respondent to express their opinion without being influenced by the researcher in part A which is in knowledge theme. Besides, closed-ended question is a limited option choice for the owner and the staff to answer the online survey in part B, which is in part B in regulation theme.

Sampling

The researcher uses non-probability sampling, which is judgement sampling or also known as purposive sampling.

Data Analysis

The researcher used thematic analysis in qualitative analysis. The methods can help researchers understand the scope and purpose of the research method. The researcher divided into three parts: part A, part B and part C. The first theme is knowledge of the halal logo, while part B is regulation. In this section, the researcher examines the extent to which managers implement the use of halal logos in their restaurants. Part C is a recommendation from the researcher in the future.

FINDINGS

Analysis of Theme 1

Table 1 below shows the result analysis of Theme 1.

Table 1: Analysis of Theme 1

Research Question	Respondent	Theme
What is the framework on halal logo regulation in Malaysia?	Respondent 1 : Ya	Knowledge
	Respondent 2 : Ya	
	Respondent 3 : Ya	
	Respondent 4 : Ya	
	Respondent 5 : Ya	
	Respondent 6 : Ya, Faham	
	Respondent 7 : Ya	
	Respondent 8 : Ya	
	Respondent 9 : Ya	
	Respondent 10 : Ya faham, kerana pernah menghadiri kursus tentang logo halal	
	Respondent 11 : Ya	
	Respondent 12 : Ya	
	Respondent 13 : Ya	
	Respondent `4 : Ya	
	Respondent 15 : Faham	

Analysis of Theme 2

Table 2 below shows the result analysis of Theme 2

Table 2: Analysis of Theme 2

Research Question	Respondent Answer	Theme
How far restaurant in Seremban follow the compliance with the terms of using halal logo?	Respondent 1 : Yes	Regulation
	Respondent 2 : No	
	Respondent 3 : No	
	Respondent 4 : No	
	Respondent 5 : No	
	Respondent 6 : Yes	
	Respondent 7 : No	
	Respondent 8 : No	
	Respondent 9 : No

	Respondent 14 : No	
	Respondent 15 : No	

Findings of Theme 1

Table 3 below shows the result Findings of Theme 1.

Table 3: Findings for Theme 1

Findings of Theme	Respondent Answer
Knowledge	'Ya faham, kerana pernah menghadiri kursus tentang logo halal' All 15 respondents understood does entrepreneurs deeply understand about halal logo. Out of 15 respondents, the researcher choose respondents 10, namely Mohd Raziz bin Sharim Shukur who is the owner of Ramzia Kitchen New restaurant. The researcher choose him because he had the right answer to meet the researcher's question. He stated that he had attended a halal logo course. This shows that the management attaches great importance to the concept of a halal logo in their business.

Findings of Theme 2

Table 4 below shows the result Findings of Theme 2.

Table 4: Findings for Theme 2

Findings for Theme	Respondent Answer

Regulation	'Ya'
	A total of 15 respondents, 4 respondents said yes this restaurant exploited the halal logo to attract the customers.
	Out of 15 respondents, the researcher choose respondents 11, Mohd Zaidi Bin Abdul Nasir, 28 years old. He is the staff of Restoran Victory. The researcher choose him because his answer was yes for restaurant exploited the halal logo to attract the customers. This indicates that the restaurant is using the halal logo incorrectly to gain customers and profits. This action is wrong and violates the conditions set by JAKIM.

DISCUSSION AND RECOMMENDATION

During the entire study, there was some limitations that came out while conducting this research and collecting data from respondent. This study is focused on Misuse halal logo in a restaurant in Seremban Negeri Sembilan. The researcher has limitation based on three things which are limited time, trust issue and limited respondent. The researcher faces limited time because of time constraints to get feedback from respondents. The researcher also needs to WhatsApp them to remind the restaurant to fill in the google form.

Next, the researcher is facing a trust issue because some respondents thought the researchers were a scammer. Also ,a restaurant does not want to share their business information and personal information because they think their personal information is not safe if they give it to the researcher. The researcher also faces limited respondent because the researcher only put the limited respondent to the owner or staff of the restaurant in Seremban, Negeri Sembilan.

For the recommendation to carry out on this topic of misuse of halal logo in a restaurant, the researcher is the restaurant needs to display the halal logo to gain customers confidence. This is because it is compulsory to display the halal logo after getting the certificate and halal logo from JAKIM.

Next, the JAKIM should tighten the enforcement of the Halal logo in every restaurant. This is because, it wants to improve law and halal related enforcement so that consumers can overcome the problems and issues regarding halal and haram. This shows that law and enforcement are relevant halal conducted in Malaysia with a proper and good foundation but still needs some improvement to strengthen such enforcement further.

CONCLUSION

The purpose of the study was to determine the misuse halal logo in a restaurant in Seremban, Negeri Sembilan. The researcher have found that some restaurants misuse the halal logo in restaurants in Seremban, Negeri Sembilan. The researcher hopes that the restaurant's owner and staff have an obligation towards halal logo in their premises.

ABSTRACT

This study examines factors influencing the customer to use food delivery apps in Klang Valley and to find the relationship between convenience, trustworthiness and price on customer perceived value. A survey was conducted using a questionnaire, involving 275 respondents who use food delivery apps. Descriptive and correlation analyses were used to analyse the data obtained. A structured questionnaire will be collected using a Google Form and questionnaire. The data collected will be analysed using Statistical Packages for Social Science Version 12.0 (SPSS Version 12.0) systems, based on descriptive statistics and correlation analysis. In conclusion, all of the independent variables, which are convenience, trustworthiness, and price, that have been studied in this study have a relationship with the dependent variable, customer perceived value, in the use of food delivery apps.

Keywords: food delivery, customer perceived value, convenience, trustworthiness, price

INTRODUCTION

Food delivery refers to a company, store or restaurant that uses a courier or runner service to deliver food to customers (Viktor,2021). The food delivery orders are executed through mobile apps, websites, or telephone. Customers who use food delivery app services searched for a favourite restaurant, chose available items, and provided their delivery address (Alom et al., 2019). As a result of advances in modern technology. The development of internet providers and increasing penetration of smartphones have driven the growth of various food delivery apps such as Food Panda, Swiggy, Zomato, and Uber Eats (Ken, 2018).

According to Baindur and Macário (2013), food delivery apps have existed in India since the 1890s, with services like Mumbai dabbawallas. However, the growth of the various online food delivery services in India came about in the 2010s with the emergence of Food Panda, Swiggy, and Domino. Food delivery apps have grown rapidlyproliferated, and the competitive dynamics of the food delivery app market have reached its global development (Jeong S, 2016). Besides, the idea of food delivery apps has spread from the United Kingdom (UK) to the United States (US), and food delivery has become a new business model worldwide.

Malaysia also has many consumers using food delivery apps service (Abirami D, 2021). According to Spykerman (2013), the internet penetration rate in Malaysia is 67%. In 2014, the Malaysian 100% home delivery market was worth RM253 million and was expected to grow at 11% per year (Rezaei S, 2017). Online food delivery services have hit essential cities in Malaysia since 2017, such as the Klang Valley, Penang, Melaka, Kuching, Ipoh, and Johor Bahru. There are various food ordering platforms on the market, including FoodPanda, Uber Eats, Grab food, Honestbee, Dahmakan, DeliverEat, Running Man Delivery, Food Ninja and LalaFood. Consumers prefer online food delivery services because of their convenience, trustworthiness, and price (Albatat A. et al., 2019).

This study aims to examine the relationship between food delivery apps towards customer perceived value. This study was also conducted to analyse the independent variables regarding convenience, trustworthiness, and price in food delivery services. There are three objectives of this research:

1. To examine the relationship between convenience and customer perceived value on food delivery apps in Klang Valley, Malaysia.
2. To examine the relationship between trustworthiness and customer perceived value on food delivery apps in Klang Valley, Malaysia.
3. To examine the relationship between price and customer perceived value on food delivery apps in Klang Valley, Malaysia.

Significance of the study

Researcher

The research paper helped the researcher understand and understand the known relationship between convenience, trustworthiness and price towards customer perceived value in Klang Valley. In addition, this study assisted in identifying factors influencing food delivery apps that impact customer perceived value, referring to a few previous studies that have focused on this topic. By relating to this research issue, the researcher may be able to provide the greatest solution or suggestion to solve the problem.

Food Service Industry

The owners may be providing better planning to increase their sales and improve their marketing strategy with the advanced technology in the food industry, which uses food delivery apps to encourage customers to place orders through the apps quickly. In addition, with improvements in online systems in the food service industry which use marketing, sales and others, the owner and customers could improve their skills to use the current facilities, making it simple to make reservations to use the food delivery apps provided. The food service industry's operator was able to respond to consumer expectations and establish an attempt to identify customer perceived value in Klang Valley by achieving customer perceived value. This study also assisted the industry and hospitality players in increasing their sales.

Future Customer

The users understood the known relationship between convenience, trustworthiness and price towards customer perceived value in Klang Valley. The researcher used this knowledge in this study to give some kindness to online food delivery apps organization, especially in Malaysia, because through this study, they were assisted get a lot of information to manage good service for customer satisfaction. This might assist the owner in increasing the quality of customer service, which in turn attracts a large number of users to try out the facilities given access through the app's information.

LITERATURE REVIEW

Food Delivery Apps in Malaysia

The foodservice business improved positively as consumer sophistication and income increased, contributing to a rise in Malaysia's food service sales (Euromonitor, 2010). Per the world Retail and Consumer Study, (2004), street stalls or kiosks dominated in terms of transactions, thanks to the recognition of hawker stalls and food stalls, which are found in both urban and rural areas. The food delivery industry is growing and has a good potential in Malaysia and globally now (Alom et al., 2020). Taste, presentation, textures, colour, warmth, portion size, and entrée complexity are all factors in food attraction. Dietary considerations are becoming increasingly significant in food quality, whether it's low-fat, low-carbohydrate, vegetarian, or vegan meals (Siguaw and Enz, 1999).

Food panda, headquartered in Berlin, Germany, is a global online platform for food delivery (Hassan,2020). In other parts of the world, they are known as "hello food.". Ralf Wenzel, Rohit Chadda, Ben Bauer, and Felix Plog established the food panda group in 2012, and it has expanded since. The services work like Grab food, allowing customers to order menus prepared by any restaurant near the delivery location. Food panda is the first app for

food delivery service in Malaysia since 2012, according to Pang (2017), followed by Deliver Eat, Honest bee, Dahmakan, and others. These apps are aggressive in their attempts to provide users with food delivery services. Customers' orders could be easily determined by observing a mobile application or website. According to Maimaiti, Zhao, Jia, Ru, and Zhu (2018), online food delivery is more convenient and user-friendly than the previous approach. Convenience, a more straightforward menu to organize, and significant savings are the benefits of online purchasing and the causes of the expansion of the food delivery app industry (Gloria, 2015)

Convenience

Convenience is the key motivator in their decision regarding how they spend their time and also their money (Parkard, J et al., 2018). Convenience represents a guarantee to access and use top-quality mobile applications (Liu et al., 2017). For example, net food delivery apps' social media platform gives consumers more alternatives and convenience by allowing them to purchase from a large variety of restaurants with just one click of their smartphone. (Hirschberg et al., 2016). Das (2018) discovered that the most attractive elements are doorstep delivery and convenience, and this is because user convenience would prioritize service quality (Chen et al., 2011).

According to He et al. (2019), a significant food delivery app's benefit comes from food options (VFCs). Cho and Park (2001); Cho et al. (2019), when utilizing food delivery apps, customers may choose between different kinds of food and pip out several vendors at various prices. Customers will get to choose from various flavours from a list of food businesses offered within the e-commerce area at any point (Jayadevan et al., 2019). As a result, consumers choose food delivery apps due to the ordering procedure's efficiency, quickness, and easiness (Verma et al., 2009). Convenience may be a significant success factor for online businesses, according to (Jiang et al., 2013). Every day, consumers can choose from many food suppliers represented on the internet at any time and from any location and to enticed to use food delivery apps frequently due to their convenience (Thamaraiselvan et al., 2019).

Trustworthiness

Trust is additionally characterized as customers' contemplations, sentiments, feelings, or practices once they feel they will rely on the provider (Patrick, 2002; Woon, Kee, Hwee, Lee, & Cheng, 2015; Sinaga et al., 2019). According to Al-Msallam and Alhaddad (2016), trust can directly increase consumer loyalty. When compared to other performance characteristics such as convenience and price, the food delivery app's trustworthiness was perhaps the essential factor for the food delivery apps, as it influences customer behaviours, customer perceived value, and purpose to use the service again (Cho, Bonn, & Li, 2018). As a result, trustworthiness benefits technical acceptability, which leads to consumer loyalty (Winnie, 2014).

According to past literature, user-trustworthiness toward mobile apps increases their decision-making for online shopping, resulting in stronger loyalty to utilizing mobile apps (Nilashi et al., 2015). Trustworthiness was the most effective result for a respondent; they are concerned about the services, trust in the merchandise and services, and the up-to-date equipment to feel comfortable when using the benefit of the food delivery apps within the previous researcher (Azizul et al., 2019). Consumers who lack trust could even be hesitant to online shopping or avoid making transactions online altogether (Isa et al., 2016).

Thus, trust is crucial for both the seller and the patron when conducting an internet transaction (Isa et al., 2016). Cho, Bonn, and Li (2018) came to the same conclusion, stating that trust is essential in influencing the perceived value of food delivery apps. To develop trust in food delivery apps, companies must focus on source credibility, webpage structure, safety, and online payments, among other things (Kedah et al., 2015). " User-trustworthiness can play a crucial role in higher cognitive operation for online shopping, as well as increased loyalty for mobile apps," says the researcher (Cho, Bonn, & Li, 2018).

Price

Price is the amount of cash asked in payment for receiving a decent or service, as well as the sum of the qualities that customers trade for its benefits of getting the product or services (Kotler & Armstrong, 2012; El Husseiny, 2018). The quality (monetary or none) a customer should give forward by exchanging goods or commodities is called price, ; a few of the important crucial elements impacting customers' satisfaction is the value-oriented (PSO), which mainly includes promotions and deals offered by merchants (Nagle et al., 2016: Sabilillah et al., 2021). Price is an essential factor in a customer's purchasing decision (Ali, Amin, & Cobanoglu, 2016; Chiang & Jang, 2007; Ryu & Han, 2010).

According to Ray, A., Dhir, A., Bala, P. K., and Kaur (2019), customers will have better experiences if given coupons, discounts, offers, and other monetary discounts. Their study has revealed that the economic incentives engagement mechanism would be ready to improve the reuse intention of the customer on the mobile food delivery apps. Azizul et al. (2019) have also discovered that food prices best impact the customer perceived value. Other studies have also found that monetary incentives like discounts and special promotions are crucial factors in customer satisfaction with food delivery apps (Ali Abdallah Alalwan, 2020; Kalimuthu & Sabari Ajay, 2020).

The recognition of food delivery apps is fast growing due to a range of perks, including food delivery to customers' doorsteps, a variety of payment choices, and appealing promotions, bonuses, and discount coupons are just a few of the features that consumers can search through virtual retail stores to locate the most straightforward deal (Market Watch, 2019). Morganti et al. (2014) said price, product quality, and repair quality influenced customer satisfaction and decision-making. Price-conscious and value-conscious consumers were defined by Jin and Gu Suh (2005). Price is a vital customer factor in other hospitality contexts, including tour operators (Talwar et al., 2020a, Talwar et al., 2020b; Lien et al., 2015; Agag and El-Masry, 2016). One of the reasons why business owners are apprehensive about subcontracting distribution to third-party online shipping companies is customers' willingness to pay delivery fees (See-Kwong et al., 2017).

Customer Perceived Value

Perceived value is the dependent variable that refers to a customer's perception of a product's services or desirability, especially compared to a competitor's product (Carol, 2020). Customer perceived value refers to "a consumer's overall assessment of the utility of a product based on their perceptions of what is received and what is given" (Zethaml, 2016). According to Carol (2020), perceived value is measured by the price the public is willing to pay for a good or service (Carol M., 2020). Perceived value explains the customer's satisfaction with a service such as a food delivery service. According to Fernandez G et al. (2018), perceived value is an equity theory; it expresses the proportion between provider revenue and consumer input. In this study, researchers agree that the price of certain goods and services influences the value of consumers who use food delivery services.

Research Hypothesis

In this study, the three hypotheses tested are:

H$_1$ There is a significant relationship between the convenience of food delivery apps and customer perceived value at Klang Valley

H$_2$ There is a significant relationship between the trustworthiness of food delivery apps and customer perceived value at Klang Valley

H$_3$ There is a significant relationship between the price of food delivery apps and customer perceived value at Klang Valley

Research Framework

Figure 1 below shows the research framework used for this study.

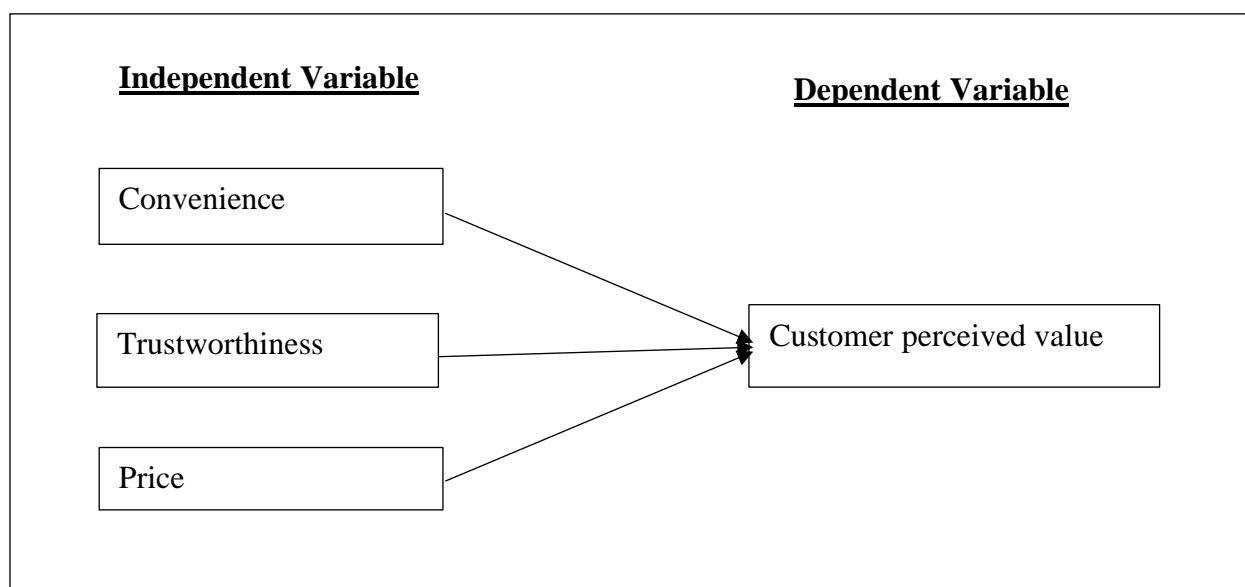

Figure 13: Research Framework

METHODOLOGY

Research Design

The research used a quantitative method to gain data through a questionnaire. The questionnaire was designed in English. There were three sections to the questionnaire: Section A, Section B, and Section C. Section A consists of demographic profile questions such as gender, age, ethnicity, marital status and time a week used food delivery services. Sections B and C on independent variables and dependent variables included 20 items with five-point Likert-scale ranging from 1=strongly disagree to 5=strongly agree. The questions were adopted from previous studies (Vincent et al., (2017), Dr Ahmad AlBattat (2019), Rodney Lim (2021), and Mahmud Hamid (2021)) by measuring customer perceived value to use food delivery apps which include convenience, trustworthiness and price. Therefore, the instrument is considered reliable.

Data Collection

Pilot testing was conducted with 30 respondents in Klang Valley to test the reliability of the study before conducting fieldwork. The fieldwork was then proceeded by distributing questionnaires randomly to 384 target respondents who use food delivery apps in Klang Valley upon consent from respondents. Respondents were required to answer all questions according to the five-point Likert scale. After all, the questionnaire is answered by the respondent; the data is collected. Researchers collected the questionnaires personally from the respondents to secure the information obtained. The final collected questionnaires reported 71.9% of response rate with a total of 276 usable questionnaires.

Sampling

This study was conducted by using simple random sampling as a sampling method to collect the data. It is the simplest form and carrying out without any biasness (Malhotra, 2017). The purpose of simple random sampling is to select the individual sample as the representative of the population. In brief, the sample size would be 384 persons based on the rule of thumb proposed by George& M (2017).

Data Analysis

SPSS statistic version 26.0 was used to analyse the quantitative data collected from the respondent. Frequency analysis is used to analyse the data on respondents' demographic profiles. Descriptive analysis was employed to identify and examine customer perceived value on food delivery apps. Person's Correlation was adopted to examine the relationship between convenience, trustworthiness and price on customer perceived value in the use of food delivery apps. Findings with a p-value of less than the conventional value of 0.05 were regarded as statistically significant, and the hypotheses can be accepted.

FINDINGS

Result of Frequency Analysis

Table 50: Frequency Analysis

Characteristic	Frequency	Percentage
Gender		
Male	93	33.7
Female	183	66.3
Status Marital		
Single	204	73.9
Married	72	26.1
Ethnicity		
Malay	151	54.7
Chinese	45	16.3
Indian	38	13.8
Other	42	15.2
Age		
Below 20	42	15.2
20-29	164	59.4
30-39	39	14.1
40-49	26	9.4
50 and above	5	1.8
How many times per week did you order food from a delivery service?		
1-4 times	174	63.0

5-7 times		86	31.2
More than 7 times		16	5.8

Table 1 shows the characterization of respondents. 93 out of 276 respondents are male, representing 33.7%, while 183 respondents are female, representing 66.3%. 73.9% of the respondents were single, and only 26.1% were married. The majority of the respondents were Malay which is 54.7%. While for the Chinese respondents only 16.3%, 13.8% of the respondents were Indian and the other 15.2%. 15.2% aged below 20 years old, 59.4% of the respondents aged between 20 to 29 years old, 14.1%% of the respondents aged between 30 to 39 years old, 9.4% of the respondents aged between 40 to 49 years old and only 1.8% of the respondents were aged 50 years old and above. In addition, 63.0% of the respondents used the delivery app food service 1 to 4 times a week, 31.2% of the respondents used the delivery app 5 to 7 times weekly, while 5.8% of respondents used it more than seven times weekly.

Result of Descriptive Analysis

Table 51: Descriptive Analysis

Variable	Items	Mean Scored	Standard Deviation
Convenience	Using the food delivery apps would be convenient for me.	4.30	1.004
	The food delivery apps would allow me to order food from any place.	4.25	1.019
	Food delivery apps would allow me to order food any time.	4.31	0.983
	I would find it easy to become skilful at navigating through online food delivery services web pages.	4.21	0.946
	I would find interaction through online food delivery services web pages clear and understandable that.	4.20	0.998
Trustworthiness	I trust the food delivery apps.	4.13	1.063
	The information provided by the food delivery apps is reliable.	4.14	0.991
	I felt secure in ordering food through the food delivery apps.	4.12	0.994
	Using food delivery apps presents the information in an appropriate format.	4.21	0.956
	Using food delivery apps provides information at the right level of detail.	4.19	0.985
Price	When I order food through the delivery apps the food is reasonably priced.	4.14	1.077
	When I order food through the food delivery apps, the food is a good product for the price.	3.95	1.002
	I like to search for cheap food deals in different online food retailer's websites.	4.28	1.015
	When I order food through the delivery apps, the food is economical.	4.10	0.986
	Online food retailer offers better value for my money.	4.22	0.945

Customer Perceived Value	Using a food delivery apps is worthy for me to devote my time and efforts.	4.34	0.960
	Compared with conventional food purchasing ways, it is wise to use the food delivery apps.	4.11	0.889
	I feel I am getting good food product with a reasonable price when I use the food delivery apps.	4.20	0.975
	I feel relaxed in receiving delivery service of online purchase.	4.21	0.961

"Convenience" scored the highest (mean = 4.25, SD = 4.404), indicating that convenience determined customer perceived value since respondents agreed with most of the items. Respondents agreed that using the food delivery apps would be convenient for me (mean = 4.30, SD = 1.004). The respondents agreed that the food delivery apps would allow me to order food from any place (mean = 4.25, SD = 1.019), and food delivery apps would allow me to order food at any time (mean = 4.31, SD =0.983). Meanwhile, I would find it easy to become skilful at navigating through online food delivery services web pages (mean = 4.21, SD = 0.946), and I would find interaction through online food delivery services web pages clear and understandable, scoring the lowest (mean= 4.20, SD = 0.998).

"Trustworthiness" scored second (mean = 4.16, SD = 4.395). Respondents agreed using food delivery apps presents the information in an appropriate format and scored the highest (mean = 4.21, SD = 0.956). The respondents agreed that using food delivery apps provides information at the right level of detail (mean = 4.19, SD = 0.985) and information provided by the food delivery apps is reliable (mean = 4.14, SD = 0.991). Meanwhile, I trusted the food delivery apps (mean = 4.13, SD = 1.063), and I felt secure in ordering food through the food delivery apps that were the lowest (mean= 4.12, SD = 0.994).

"Price" scored the lowest among the variables (mean = 4.14, SD = 4.294). Specifically, respondents slightly agreed that when I order food through the delivery apps, the food is reasonably priced (mean = 4.14, SD = 1.077), and when I order food through the food delivery apps, the food is a good product for the price scored the lowest (mean = 3.95, SD = 1.002). Next, the respondent agreed that I like to search for cheap food deals on different online food retailer's websites and scored the highest (mean= 4.28, SD = 1.015). Respondent agreed that when I order food through the delivery apps, the food is economical (mean = 4.10, SD = 0.986), and Online food retailer offers better value for my money (mean =4.22, SD = 0.945).

The dependent variable – customer perceived value scored (mean = 4.22, SD = 4.124). Respondents strongly agreed that Using a food delivery app is worth for me to devote my time and efforts scored the highest (mean = 4.34, SD = 0.960), and the lowest score was compared with conventional food purchasing ways. It is wise to use the food delivery apps (mean = 4.11, SD = 0.889). I feel I am getting good food products at a reasonable price when I use the food delivery apps (mean = 4.20, SD = 0.975), and I feel relaxed in receiving delivery service of online purchase (mean = 4.21, SD = 0.961).

Result of Reliability Analysis

Table 4 below shows the result of the reliability analysis

Table 52: Reliability Analysis

Variables	Number of Item	Cronbach Alpha
Convenience	5	0.934
Trustworthiness	5	0.928
Price	5	0.907
Customer Perceived Value	5	0.923

Table 4 shows the reliability analysis of the three variables of customer perceived value. The reliability Cronbach's alpha coefficient value for convenience (0.934), trustworthiness (0.928) and price (0.907) is scored highest, which indicates a very excellent level of reliability. However, customer perceived value also gained (0.923), which indicates questionable.

Result of Pearson Correlation Analysis

Table 4 shows the result of the Pearson correlation analysis

Table 53: Pearson Correlation Analysis

Hypothesis	P. Value	Result (Supported / Not Supported)
H₁: There is a significant relationship between the convenience of food delivery apps and customer perceived value at Klang Valley.	0.889	H₁ is supported
H₂: There is a significant relationship between the trustworthiness of food delivery apps and customer perceived value at Klang Valley.	0.869	H₂ is supported
H₃: There is a significant relationship between the price of food delivery apps and customer perceived value at Klang Valley.	0.854	H₃ is supported

Table 3 indicates that convenience and customer perceived value 0.889, which indicated a strong linear relationship. Following trustworthiness and customer perceived value showed 0.869, indicating also a strong linear relationship. Meanwhile, price and customer perceived value 0.854, indicating the same strong linear relationship. All three variables positively correlated to customer perceived value and were significant since $p<0.09$.

H1: There is a significant relationship between the convenience of food delivery apps and customer perceived value at Klang Valley.

The current study is similar to previous research that mentioned clients prefer online ordering since it gives them more control and convenience, which leads to increased satisfaction (Jeneefa & Rajalakshmy, 2020). The convenience of online shopping might lower non-monetary costs such as time, energy, and effort spent purchasing goods or services (Zeithaml, 1988).

H2: There is a significant relationship between the trustworthiness of food delivery apps and customer perceived value at Klang Valley.

Previous research supports this assumption from Zhang et.al (2016). The growing practice of manipulating online material threatens the value of online sites by compromising their trustworthiness as a source of essential product and service decision-making. The relationship of confidence and loyalty between consumers and their influencers was observed to have a positive impact on the durability of the relationships between followers and influencers, sales, and brand recognition (Munnuka et al, 2016).

H3: There is a significant relationship between the price of food delivery apps and customer perceived value at Klang Valley.

Here is evidence from previous studies to recalibrate the above statement. According to El-Adly & Eid (2015), customers perceive value as a multidimensional construct focusing only on cost, price, or money. Taxes and different contracts can see as capacities with numerous information sources; the result is a current or future price (Cho et al., 2019)

DISCUSSION AND RECOMMENDATION

Several challenges and limitations faced in the study and to be highlighted for future research purposes. The limitation of the study the limitation encountered in pursuing this study is time constraints because the time given for finishing this study is short. Furthermore, limitations for

this study also make it difficult to find the right time to initially distribute group discussion with the current problem of Covid-19, but also get the proper response from our group members.

Next limitation in this study is the problem for researchers to complete the study as soon as possible and to wait longer to collect information from the respondent. The required number of responders is 384, but the time given is limited because some respondents did not respond or cooperate in answering the questions. Therefore, our group members worked hard to spread the questionnaires through all social media platforms and too many contacts to suffice the required number of respondents.

There are numerous suggestions for future studies that researchers can investigate. Although methodologically challenging, longer-term studies that sought to answer the research question "What is the relationship between the convenience, trustworthiness, and price of food delivery apps and customer perceived value?" would be highly beneficial. The end of this study will benefit the customer's perceived value to use food delivery apps in Klang Valley, Malaysia. According to M. Cho, A. Bonn, J. Li (2019), another recent study emphasized the significance of improving a vital set of smartphone app performance criteria able to represent 'convenience,' 'design,' and 'trustworthiness' in order to improve user-friendliness. Three factors influence customers to use a food delivery app: convenience, trustworthiness and price. As a result, if all customer expectations for this application are met, they will continue to use it, influencing other customers to do the same.

CONCLUSION

This final chapter has had the entire decision and mentions the findings of factors influencing the value of customer perception to use food delivery applications in Klang Valley, Malaysia. Once the data was collected, the study's objectives were met, the research questions were answered, and the hypotheses were validated and accepted in this study based on an analysis of 276 usable questionnaires. Ultimately, the relationships between convenience, trustworthiness, and price on food delivery apps in Klang Valley are incredibly positive and strong. The relationship between convenience and food delivery app was positively significant, the highest compared to trustworthiness and price. Even though the significant relationship between price on food delivery app was lowest, but the result was also being the positive strong relationship. The study successfully found that more than half of respondents regarded convenience as the most important factor influencing customers' perceived value of using food delivery apps. At the same time, price played the least important role in determining the influence customers' perceived value of using food delivery apps.

ABSTRACT

The study examines customer satisfaction towards Airbnb in Klang Valley and finds out the relationship between reliability, assurance, tangible responsiveness and empathy on customer satisfaction with Airbnb. Descriptive and correlation analysis were used to analyse the data obtained. Finding revealed that the five variables are significantly related to customer satisfaction with tangible showed the strongest relationship while reliability was the weakest relationship on customer satisfaction. The results are in line with previous research whereby assurance, responsiveness and empathy are essential determinants affecting customer satisfaction. Implications and recommendations were provided for future researchers in line with the study.

 Keywords: customer satisfaction, assurance, tangible, reliability, responsiveness and empathy

INTRODUCTION

The accommodation industry is a crucial component of tourism. (AJ Veal et al., 2015). Tourists desire to receive a local cultural experience that they cannot get from superficial tour packages. Hence homestay has always been considered immersive tourism rather than merely visiting a destination (N.A. Ahmed et al., 2014), (Sin, 2009). One of the accommodations nowadays is Airbnb trends has growth in Malaysia. Over the previous decade, the sharing economy has become increasingly important globally. Since its launch in 2008, Airbnb significantly impacted the hotel business (Ert et al., 2016; Oskam & Boswijl, 2016). Airbnb now operates in over 5,600,000 places worldwide (Brian Chesky, 2021), with over 1 billion tourists staying in Airbnb accommodations in 2021, about 22% more than Hilton Worldwide (Price Waterhouse Coopers, 2021).

Malaysia is where the progressive spread of internet booking is a trend in the tourism industry (Bhatiasevi & Yoopetch, 2015). Travellers from 78 countries have used Airbnb to book rooms in Malaysia, according to Razli et al. (2017). The population of Malaysia is 147 million people (Malaysia Department of Statistics, 2021). In 2010, about 20% of all international visitors were under the age of 20. Malaysia's National Youth Development Policy, passed in 1997, applies to people aged 15 to 40. (2020) Azhar et al.

Airbnb rental platform is a brand that has emerged in recent years due to technological advancements that have disrupted the old way of people reserving accommodations. Airbnb is often regarded as the most successful peer-to-peer model for the two hotel businesses, owing to its excellent reputation worldwide. (S. Q. Liu and A. S. Matilla, Int. J. 2017). With around 32,000 daily listings, Airbnb climbed by over 137% in Malaysia throughout the year, making it the most in the Asian region (The Star Online, 2018).

Popular tourist destinations such as Kuala Lumpur, Penang, Port Dickson, and Ipoh all have Airbnb. (2020, Al Sadat Zyed et al.) Airbnb is a service provider. Service quality is a critical aspect of an organization's success since it is highly linked to customer happiness, especially in the service business. Service quality is described as how well a service meets a customer's satisfaction and criteria, demonstrating the term's versatility, which is highly reliant on the context (Alom et al., 2019). In a market where competition is fierce, service quality is one of the most critical requirements for hoteliers to preserve their competitive advantage and acquire

consumers' trust (Chen and Chen, 2014). Since the 1980s, various scholars have been interested in analysing service quality because of its importance to organisational effectiveness (Greenrooms, 1982; Zeithaml et al., 1993). This study aims to provide insight into customer satisfaction with Airbnb in Klang Valley. Those study findings are important since Airbnb is growing in the cities. However, this study emphasizes the determinants influencing customer satisfaction to Airbnb in the scope of selected areas in Kuala Lumpur. There are five objectives of this research:

       1. To examine the relationship between reliability and customer satisfaction Airbnb service quality

       2. To examine the relationship assurance and customer satisfaction on Airbnb service quality

       3. To examine the relationship between tangible and customer satisfaction on Airbnb service quality

       4. To examine the relationship between empathy and customer satisfaction on Airbnb service quality.

       5. To examine the relationship between responsiveness and customer satisfaction on Airbnb service quality.

Significance of the Study

Researcher

The paper helped the researchers explore and discover critical aspects on how reliability, assurance, tangible , responsiveness and empathy determine customer satisfaction on Airbnb in Klang Valley ,Kuala Lumpur that past research have not discovered. Future scholars may provide ideas and assumptions to fix this challenge by referring to this research issue.

Hospitality industry

The research paper provides insights into the industry on customer satisfaction with Airbnb in Kuala Lumpur. The hospitality manager will change service quality to further strengthen and improve service quality of reliability, assurance, tangible, responsiveness and empathy to more strategic and good.

To future customer

Customers have complete control over their data, which they may access at any time and from any location. The increased internet usage to shop, research, and make purchases 13 emphasizes the importance of speed and connectivity in consumer satisfaction and service expectations. Consumers are growing savvier, with the gap between the skilled seller and the knowledgeable buyer narrowing. Hotel visitors return to the same hotel and suggest it to others, depending on their degree of happiness, resulting in a rise in revenue for the hotel. As a result, any study should focus on service quality, as practically all businesses strive to improve their service quality to increase customer satisfaction.

LITERATURE REVIEW

Overview of acommendation Industry in Malaysia

Any tourism product's key component is accommodation (AJ Veal et al., 2015). The quality of available lodging is a central deciding element in choosing a trip. While typical lodgings such as hotels provide a consistent experience regardless of location, a Homestay gives individualized services with an authentic local' touch (Gunasekaran N, 2012). Homestay is a type of tourism that allows visitors to better understand the destination's culture and lifestyle (Biswakarma, 2015). According to Beard (2014), various arguments are utilized to highlight the importance of customer satisfaction since a satisfied client has a higher probability of repurchasing. According to Radder and Yi (2006), guesthouses are cheaper than hotels. The services of a guesthouse include a kitchen, a sitting room and washing and drying facilities (Malhotra, 2014). One of the accommodations nowadays is Airbnb trends has growth in Malaysia. Airbnb (Guttentag, 2015) is one of the most well-known and much-debated examples

of this phenomenon, with over 3 million listings in 65,000 cities across 191 countries, facilitating an average of 500,000 stays per night and having been used by over 150 million guests since its founding in 2008. Trustworthy persons to be allowed permission to book (Karlsson et al., 2017). Indeed, depending on their location and apartment type, Airbnb hosts can make a lot of money by renting out a shared room, a private room, or their entire apartment for a few days, weeks, or even months (Jung et al., 2016). The ability of hosts to generate income is dependent on how much demand they can attract at a given price. Trust is, therefore, essential in order to convert an interested user's attention into a concrete booking request (Gebbia, 2016; Hawlitschek, Teubner, and Weinhardt, 2016).

Assurance

Assurance of service quality is described as whether or not the service providers have awareness and civility when providing faith and self-belief services to their potential clients (Bharwana et al., 2013). Competence, courtesy, credibility, and security are the four components of assurance (Bharwana et al., 2013) .According to Francais (2012), assurance relates to how service providers may create trust and confidence in their clients while providing services. To increase overall customer satisfaction in the Airbnb industry, service providers must have a variety of skills, including providing courteous service, having a broad range of relevant knowledge about Airbnb,and the ability to make guests feel safe and secure while staying in the Airbnb(Ahmad et Al,2018).As a result, manager Airbnb must provide proper training to all service providers to ensure their credibility and believability to entice guests to return.(Eshetie et al,2016).When using Airbnb's many services, customers must feel safe and secure and want to feel safe during their stay (Anwar & Louis,2017). Staff at Airbnb must be consistently pleasant and friendly with customers. The Airbnb provides a safe environment to stay in; Airbnb also keeps customers up to date on service quality(Bayad Jamal Ali,2021).

Tangible

Tangibility, according to (Abdullah et al.2017), refers to the cleanliness of the rooms, restaurants, and other locations, as well as the clean and proper uniforms worn by personnel, the use of disposable gloves, and so on. The look of physical factors such as the apparatus and facilities given by a service firm are is characterised as tangibility of service excellence. It also refers to the service providers' appearance when serving potential customers (Alhkami & Alarussi, 2016). The visual appearance of the customer service workers is also considered tangibility (Mukhles Al 24 Ababneh, 2016). In reality, Airbnb managers must nurture tangible service quality traits to ensure that the dimension of tangibility enables them to meet or even surpass clients' expectations (Rao & Sahu, 2013). The AIRBNB features modern-looking equipment, clean and comfy rooms, a swimming pool, sauna, health club, and fire safety facilities and instructions, to name a few practical examples (Bayad Jamal Ali et al.). Because service providers commonly use tangibles to reinforce their reputation, provide consistency, and convey quality to clients, most businesses combine tangibles with other tangibles to build a service quality strategy for the company (Anwar & Balcioglu) fact, people living in urban areas (UK) are more likely to produce higher quantities of food waste than people living in rural areas (India) but mostly kids had to generate minimum food waste. Focusing on socio-economic status and standards of living, it was found that highly educated individuals with higher disposable income as well as higher income families waste more than poorer households. In contrast, other researchers found little or no correlation between income and food waste (Secondi et al., 2015). People living in urban areas have great jobs, and high incomes that tend to be indifferent and also have an attitude of extravagant buying. instead, people living in rural areas are more concerned and have awareness about food waste which is help them to produce less food waste.

Reliability

The ability of service providers to provide and deliver the proper and appropriate services promptly is referred to as service quality reliability (Bharwana, Bashir & Mohsin,2013). According to Bucak (2014),reliability is also known as trustworthiness, and it indicates the trustworthy and correct services that a services organization provides to its potential clients. The definition of reliability is the stability of measurement instruments; different measurements produce the same results (Janet mc coll- Kennedy & Ursula Schneider, 2000). The Airbnb policies must be improved to ensure that service providers can consistently provide the promised service to potential clients while visiting the Airbnb (Wang'ombe & Ngige, 2016).In reality, reliability is linked to customer satisfaction because it is an efficient strategy to boost customer happiness when service providers are dependable in providing relevant solutions constantly (Eshetic et al., 2016).

Responsiveness

The responsiveness of a service provider to rapidly assist its potential customers demonstrates the responsiveness of service quality (Alhkami & Alarussi, 2016). It is an important factor that will negatively impact customer satisfaction because most customers prefer quick service over sluggish service (Virgillito, 2016).In general, responsiveness focuses on how service providers enable customers' complaints and problems to be resolved quickly (Chamber 2014). In the Airbnb industry, service providers should always be found and available to provide personalized or individualized attention to each guest as much as possible; they should also be required to have enough knowledge and abilities to provide relevant information to guest whenever they are needed.(Ahmad & Papastathopoulos).Responsiveness is one of the most important service quality factors closely associated with service providers because they can tell whether a service company succeeds or fails when solving a customer's problem or query.

Empathy

Empathy is paying close attention to consumers to provide compassionate and distinctive service (MM Kobiruzzaman,2015).Accessibility, communication, and understanding of the clients are three different components of empathy in service quality (Lovelock & Wirtz,2011). Service providers develop their attempts to recognize consumers' requests and requirements is related to customer comprehension (Jasinskas, Streimikiene, Svagzdiene & Simanavicius, 2016). Then, the manager of Airbnb should organize specific courses for their service providers to ensure that they can improve their communication skills when dealing with clients (Rau & Sahu, 2013). As a result, discovered that to achieve high customer satisfaction, hotels must strategically choose their location, train their service providers to deliver an effective communication process, and ensure they are wellequipped to understand and fulfil the customers' needs and wants.

Customer satisfaction

Customer satisfaction is sometimes regarded as a critical issue that every organisation, particularly those in the service industry, should carefully consider because it indicates an effective strategy for improving service quality and sustaining customer loyalty in today's highly competitive analysis (Awwad,2012; Alhkami & Alarussi,2016).In today's sector, winning entails more than just creating goods; it also entails providing more excellent value to target customers than competitors.Customer feedback on the satisfaction they obtain from consuming the products will determine if a business provides quality services or not Because better levels of quality lead to increased consumer satisfaction(Kotler & Keller,2009).

Research Hypothesis

The literature review highlighted that independent variables like attitude and value of awareness do affect household food waste in Malaysia. Therefore, the study planned to examine 114 the level of effect among these variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H_1	There is significant relationship between Assurance and customer satisfaction.
H_2	There is significant relationship between reliability and customer satisfaction.
H_3	There is significant relationship between responsiveness and customer satisfaction.
H_4	There is significant relationship between tangible and customer satisfaction.
H_5	There is significant relationship between empathy and customer satisfaction.

Research Framework

Figure 1 below shows the research framework used for this study
Figure 1: Research Framework adopted from Bayad Jamal Ali et.al (2021)

METHODOLOGY

Research Design

In this research, the survey will conduct by online internet survey. The advantages of internet online survey are cost saving, easy editing/ analysis, faster transmission time and access to unique populations (Kevin B.wright, 2006). The questionnaire contains a demographic section with multiple choices answers. The respondents must have to choose the determinant choices. On the google form, several sections are related to the impact on individuals and companies, Factors, and so on that need to be answered by the selected Airbnb customers. The google form has one to five options for answers. The first is firmly disagree until five, which is strongly agree. The selected employee only needs to choose one answer. The questions given are straightforward to understand, and concise.

Data Collection

The researcher will collect this study using a questionnaire and secondary data. A questionnaire is a set of questions or prompts used to gather information from a respondent (Kumar, Talib & Ramayah, 2013). The survey will be divided into three sections: section a, section B, and section C. All information will be given to Airbnb customers in Malaysia. The respondents will be given the questionnaire in English and Malay. Before distributing the questionnaire, the researcher would go throughout Kuala Lumpur collecting data by first obtaining consent from the target respondent. The data will be collected after the respondent has completed all 25 questions on the questionnaire.

Sampling

In this study, a non-probability sampling technique which is convenience sampling, was selected due to the current situation. Convenience sampling is a technique where samples are selected from the population as it is conveniently available (Khalid et al., 2012). Respondents in the target group are Malaysians who use Airbnb. The questionnaire was designed using Google Forms and distributed across social media, namely WhatsApp, Instagram, Twitter, and Facebook. By using Google Forms and social media, researchers can get more respondents.

Data Analysis

The quantitative data collected from respondents were analysed using SPSS version 26.0. The data on the demographic profile of respondents is being analysed using frequency analysis. Customer satisfaction with Airbnb service quality was identified and examined using descriptive analysis, and Pearson's Correlation was used to investigate the relationship between food reliability, assurance, palpability, empathy, and responsiveness to customer happiness on Airbnb service quality. Findings with a p-value less than or equal to 0.05 were considered statistically significant, and the hypotheses were accepted.

FINDINGS

Result of Frequency Analysis

Table 1: Demographic Respondent

Respondent profile	Classification	Frequency n=365	Percentage (%)
Gender	Female	222	60.8
	Male	143	39.2
Age	Below 20	43	11.8
	21-30	308	84.4
	31-40	12	3.3
	Above 40	2	0.5
Race	Malay	336	92.1
	Chinese	15	4.1
	Indian	12	3.3
	Other	2	0.5
Status	Student	249	68.2
	Employee	100	27.4
	Unemployed	16	4.4
Income	Below RM1000	275	75.3
	RM1001-RM2000	63	17.3
	RM2001-RM3000	27	7.4

Table 1 shows the characterization of respondents. 143 out of 365 respondents are male, represented 39.2%, while 143 respondents are female, representing 60.8%. Next, 11.89% of the respondents are below 20 years old, 84.4% of the respondents are between 21 to 30 years old, 3.3% of the respondents are between 31 to 40 years old, and only 0.5% of the respondents were aged 40 years old and above. The most famous race of respondents is Malay with 92.1%, followed by Chinese with 4.1%, Indian with 3.3% and others with 0.5%. 68.2% of the total respondents were student students remaining represented by both employees and non-employees. In addition, most respondents earned below RM1,000 monthly 75.3%, followed by the income of RM1001-RM2,000 with 17.3%, and RM2,001-RM3,000 with 7.4%.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variables	Statement	n	mean	SD
Assurance	The property and its facilities have operating hours convenient to all their guest.	365	5.8521	1.02712
	It is easy to access to the property (transportation, car parking area, etc).	365	5.7205	1.06840
	Staff at the Airbnb are consistently courteous and friendly with customer.	365	5.7041	1.02180
	Airbnb area providing a safe and secure place.	365	5.6795	1.07863
	The capability of service providers to provide and deliver the relevant and correct service within a promised way	365	5.7699	1.06217
Tangible	The atmosphere and equipment are comfortable and appropriate for purpose to stay (beds, chair, room, etc, comfortable, clean and tranquil)	365	5.8521	1.02712
	The equipment of the property works properly without causing breakdowns.	365	5.7205	1.06840
	The Airbnb host provides the services.	365	5.7041	1.02180
	The Airbnb host provides the services at the time it promises to do so.	365	5.6795	1.07863
	Food and beverage served are hygienic. Adequate and sufficient. (Soap, shampoo, towel etc).	365	5.7699	1.06217
Reliability	Staff of the hotel able to provide service as promised.	365	5.5863	1.07485
	Staff of the hotel are dependable in handling customers' service problem.	365	5.5260	1.14475

	The hotel keeps customers informed of the performance of service.	365	5.4411	1.24696
	The service providers enable to consistently deliver a promised to its potential guests while visiting the Airbnb.	365	5.5562	1.09957
	The service providers are trustworthy to provide relevant responses consistently	365	5.5671	1.11632
Empathy	The Airbnb gives its customers individualized attention.	365	5.6438	1.05312
	Staff of the Airbnb understand the specific needs of them customers.	365	5.6521	1.04673
	Staff of the Airbnb have customers' best interest at heart.	365	5.6000	1.05299
	Staff understand customer need or try to understand it	365	5.6164	1.05391
	Staff is very cooperative to provide customer the request service.	365	5.6877	1.00054
Responsiveness	Staff at the Airbnb are ready to respond to customers' requests.	365	5.7315	1.06607
	Staff at the Airbnb are always willing to help customers.	365	5.7233	1.06783
	Staff is never being too busy to respond customer queries.	365	5.4767	1.15198
	Staff treat all customers equally regardless of whether they know someone in the Airbnb	365	5.6000	1.14546
	Does your service provider is willing to resolve your complaint?	365	5.6438	1.06608
Customer satisfaction	Your overall experience as a Guest?	365	5.6959	1.02341
	Customer satisfaction refers to a person's satisfaction with a product, a service, or a supplier	365	5.7589	1.02279
	Service quality is an important element of customer satisfaction.	365	5.7808	1.09503
	Customer satisfaction is taken as a yardstick for measuring the quality of service and providing excellent Customer service that decides the	365	5.08082	1.06464

	effectiveness of delivery process			
	Customer satisfaction has significant implications for the economic performance of firms	365	5.8137	1.03421

Table 2 shows the mean and standard deviation for 32 statements under five independent variables under the dependent variable based on the survey involving 365 respondents. The highest mean value for the effects of assurance and tangible was obtained by question 1 with 5.8521. The respondents agreed that the property and its facilities have operating hours convenient to all their guests for assurance. The atmosphere and equipment are comfortable and appropriate for the purpose of staying (beds, chairs, room, comfortable, clean and tranquil) for tangible. The lowest mean value of assurance and tangible was question 4 with 5.6795, where the respondents agreed that the Airbnb area provides a safe and secure place and the Airbnb host provides the services at the time it promises to do so.

As for types of reliability, the highest mean value was obtained by question 1 with 5.5863, where the respondents agreed that the Staff of the hotel is able to provide service as promised. The lowest mean value belongs to question 3 with 5.4411, where the respondents agreed that the hotel keeps customers informed of service performance. Meanwhile, the highest mean value for empathy was obtained by question 5 with 5.6877, where the respondents agreed and they know that the staff is very cooperative in providing the customer with the requested service taking. The lowest mean value belongs to question 6 with 5.600, where the respondents agreed that staff of the Airbnb have customers' best interest at heart. While for responsiveness, the highest mean value was obtained by question 1 with 5.7315, where the respondent agreed that Staff at Airbnb is ready to respond to customers' requests. Next, the highest mean value for the dependent variable of customer satisfaction on Airbnb service quality was obtained by question 5 with 5.8137, where the respondents agreed that Customer satisfaction has significant implications for the economic performance of firms. The lowest mean value belongs to question 4 with 5.08082, where the respondents agreed that customer satisfaction is a yardstick for measuring the quality of service and providing excellent Customer service that decides the effectiveness of the service delivery process.

Pearson's correlation between Assurances, tangible, reliability, empathy and responsiveness on customer satisfaction on Airbnb service quality.

Result of Reliability Analysis

The below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of items	Cronbach Alpha
Reliability	6	0.950
Assurance	6	0.942
Tangibles	6	0.941
Empathy	6	0.940
Responsiveness	6	0.941
Customer satisfaction	6	0.944

Following the pilot reliability test, the usable questionnaires, which include the selected 365 respondents, will be subjected to a real reliability test. Table 4.4 shows the reliability analysis of the five service quality variables toward Airbnb customer satisfaction. The reliability Cronbach's alpha coefficient value for reliability was 0.950, indicating excellent reliability. While reliability Cronbach's alpha coefficient value for assurance is 0.942 and for tangibles 0. 941 indicates good, customer satisfaction toward Airbnb gained only 0.944, which indicates questionable.

Result of Pearson Correlation Analysis

The below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Significant (p-value)	Decision
H_1: There is significant relationship between assurance and customer satisfaction on Airbnb service quality in Lembah Klang.	3.3167	H_1 is supported.
H_2: There is significant relationship between tangible and customer satisfaction on Airbnb service quality in Lembah Klang.	2.8544	H_2 is supported
H_3: There is significant relationship between reliability and customer satisfaction on Airbnb service quality in Lembah Klang.	1.2192	H_3 is supported
H_4 : There is significant relationship between empathy and customer satisfaction on Airbnb service quality in Lembah Klang.	6.5893	H_4 is supported
H_5: There is significant relationship between responsiveness and customer satisfaction on Airbnb service quality in Lembah Klang.	6.5893	H_5 is supported

**. Correlation is significant at the 0.01 level (2-tailed)

DISCUSSION AND RECOMMENDATION

The study experienced some specific issues and limits, which the influence of service quality on Airbnb customer satisfaction in Klang Valley, Malaysia, will highlight for future research. Respondents' survey responses cast doubt on the truth, resulting in incorrect findings that service quality should eliminate from the study. Future research is encouraged to be more creative and original in gathering respondents' data using qualitative methods such as in-depth interviews to obtain more reliable and detailed data. Second, due to eliminating unsuitable data, researchers confront restrictions in the accuracy of interpretive data. The researchers alone covered five determinants in this study. However, other crucial criteria may play a part in deciding the researcher's propensity to revisit consumers who were left behind. As a result, future researchers should perform additional research into other characteristics such as location, atmosphere, and proper facilities to accurately identify a customer's propensity to return to Airbnb. Customers may have varied opinions based on customer satisfaction; thus, future studies should examine new ones to perform surveys. A comparative study for Airbnb in different states in Malaysia might be undertaken by widening the sampling framework to include Kuala Lumpur and Selangor as a benchmark of customer revisit intentions.

CONCLUSION

This research examines the factors of service quality that influence customer satisfaction with Airbnb in the Klang Valley. The findings revealed that reliability, certainty, responsiveness, and empathy moderately affect customer satisfaction with Airbnb. Although most respondents agreed that tangibility was the most important factor in service quality when it came to Airbnb customer satisfaction, service quality discovered that the relationship between tangible and customer satisfaction is significantly weaker now that customers expect Airbnb to be more than just a place to work. Due to its popularity among millennials and locals, the study found that even though the factors are still far from achieving their optimum level, customers will return to Airbnb in Klang Valley in Kuala Lumpur. As a result, the study's goals have been completed.

ABSTRACT

The study investigates the impact of online restaurant menus on consumers' purchase intentions in Klang Valley, Malaysia, to determine the relationship between menu visual appeal, menu informativeness, and food desire on consumers' purchase intentions. The online restaurant menus faced problems during COVID-19 and associated with the customers purchased. Hence, there are strong indications that digital or online menus will be around long after the pandemic ends, for the simple reason that many customers enjoy using them. The study's objectives areo examine the effect of menus visual appeal, menu informativeness and desire for food on consumers' purchase intentions. A questionnaire-based survey of 279 people who had previously used online menus at Klang Valley restaurants was conducted. The data were analysed using descriptive and correlation analysis. The findings demonstrate that the three variables are highly related to consumers' purchase intention, with the most vital relationships being visual menu appeal, menu informativeness, and desire for food. Following the findings, future researchers were given implications and recommendations. The implications of this research study supplied all of the necessary facts, particularly on how visual menu appeal, menu informativeness, and desire for food influence consumers' purchase intentions. This research may also help future consumers better understand the elements that influence their purchase intention.

Keywords: Klang Valley, consumers' purchase intentions, menu visual appeal, menu informativeness, desire for food

INTRODUCTION

In 2020, the coronavirus (COVID-19) was declared a pandemic, causing significant economic damage worldwide. As a result of the pandemic, policymakers all around the world have encouraged individuals to restrict their face-to-face interactions. People heard demands from the news and social media daily such as social distancing, self-quarantining, and isolation. For example, after the White House advised individuals to avoid mass gatherings and personal interactions to aid limit COVID-19 transmissions, most Americans (approximately 9 out of 10) stayed at home (Balz and Guskin, 2020).

Most restaurants were required to halt dine-in services during the first wave of the pandemic, which began in mid-March 2020, and only takeout, drive-thru, or delivery services were allowed. According to studies conducted by the National Restaurants Association (2020), the restaurant business lost more than $120 billion in sales by May 2020, and 8 million people were put off or furloughed. According to estimates, the pandemic might cost up to $240 billion by the end of the year (National Restaurant Association, 2020). Even though restaurants in every state were eventually authorized to reopen, restaurant owners still needed vital health information to reduce the chance of COVID-19 spreading.

Restaurant menus on the internet are frequently an afterthought. However, they are more significant than you may believe (Katherine Pendrill, 25 June 2021). An online restaurant menu is a list of various foods and beverages that are displayed on the owners' websites. It didn't simply look at foods and drinks; the information was presented in various ways, including pictures, titles, and formats. At the time of publication, all pricing and information were correct. Most people used to choose where to eat by looking at the menu in the window of any restaurant or asking a friend for a recommendation.

Online food delivery is defined as "the process by which food ordered online is prepared and delivered to the consumer" (Li et al., 2020). Food safety and hygiene are a challenge for online food delivery services because food delivered through online food delivery services can be contaminated due to the addition of delivery processes to the traditional restaurant business model (Alom et al., 2019). Additional concerns with online food ordering services include temperature control, packaging, and appropriate food containers during the delivery process (Maimaiti et al., 2018). As a result, customers who use online food delivery may have a higher food safety risk perception because they cannot observe the restaurants' and employees' hygiene in person, which may affect online restaurant menus on consumers' purchase intentions.

This study aims to provide insight into online restaurant menus on consumers' purchase intention in Klang valley. The findings of this study are essential since online restaurant menus are growing since covid-19 starts. However, this study emphasizes the determinants influencing consumers' purchase intention to online restaurant menus in the Klang Valley.

There are three objectives of this research:

1. To examine the effect of menus' visual appeal on consumers' purchase intentions in Klang Valley, Malaysia.
2. To examine the effect of menus and menu informativeness on consumers' purchase intentions in Klang Valley, Malaysia.
3. To examine the effect of menus and the desire for food on consumers' purchase intentions in Klang Valley, Malaysia.

SIGNIFICANCE OF THE STUDY
Researcher
The research paper assisted the researchers in exploring and discovering critical aspects of how visual menu appeal, menu informativeness, and consumer purchase intention in online restaurant menus in Klang valley that previous research had not discovered. By referring to the title of this research paper, future researchers will most likely be able to define what is required.

Food and Beverage Industry
In the Klang Valley, the study paper offers insights into consumer purchase intentions for online restaurant menus. Operators and marketers will be able to adapt to consumer intention and match customer demand. The sector will be able to obtain competitive advantages through better decision-making, resulting in increased profit.

LITERATURE REVIEW
Customer purchase Intention
Purchase intent is an important factor for consumers to consider when evaluating a product. Purchase intention, according to a previous study, refers to a customer's intention to buy a product or service. To put it another way, purchase intention refers to the likelihood of a consumer purchasing a product after considering it. Customers who have motives to buy a given product are said to have purchase intention. Acquire intention, according to Morwitz (2012),cording to Morwitz (2012), acquire intention is a sort of consumer behavior that appears in reaction to objects that suggest a person's desire to purchase something.

Menu visual appeal, menu informativeness, and food desire are all factors that strongly influence customer buy intent. In a prior study, a menu's aesthetic appeal and informativeness were proven to have a significant impact on client purchase intent. In a restaurant, bar, or hotel, a digital menu is displayed on a screen rather than printed on paper (Scott Schulfer, 2021). Menus describe the characteristics of the cuisine served in a restaurant, and each menu has its description. Menus are a powerful marketing tool that can affect consumers' purchasing decisions and their enjoyment of the meal served.

Menu visual appeal

Menu visual appeal relates to menu selection, graphics, and background colours that help to improve the overall appearance of menus on the website and in other smartphone applications (Van van Heijden, Verhagen, & Creemers, 2003).In contrast, the visual appeal of the food on the menu is just as significant as the tasting experience. Using design in plating raises the dining experience above just eating and enjoying it to a work of art and artistry. Form, texture, and colour are used to tell the story to create emotions and feelings (McCall and Lynn, 2008). Although many of these efforts have been successful in raising consumers' purchasing intentions and behaviours, little study has been done on how menus' aesthetic appeal and informativeness have influenced consumers' intermediate states and purchase intentions (Hou et al., 2017).

Tonkin et al. (2019), the appeal of menus influenced how consumers felt about their purchased food. According to Choi et al. (2010), menus can psychologically engage consumers' senses when they make food choices. Much of the research on this topic has focused on using the visual appeal of menus to increase revenue from food purchases (i.e., Brewer & Sebby, 2021). Menu visual appeal has been linked to perceived food quality because menus serve as a benchmark for establishing customers' expectations for their dining experience (Lin et al., 2015). Verma et al. (1999) discovered that diners from certain cultures prefer more visual stimulation in their menus than others to encourage them to purchase a menu item.

Menu informativeness

The informativeness of menus has also been investigated and used to increase revenue from food purchases (Brewer & Sebby, 2021). While the visuals on menus are essential in piquing customers' curiosity and intention to purchase (Wyer et al., 2008), the descriptions of meals on menus can also influence customers' purchase behaviour (Peters & Remaud, 2020). According to Tuorila et al. (1994), how menus present information can influence an individual's willingness to try new foods.

Several studies have found that customers expect a menu with nutritional information, ingredients, and food preparation methods (Mills and Thomas, 2008; Peters and Remaud, 2020). According to other research, detailed descriptions of menu items influence customers' food choices and increase restaurant sales (McCall and Lynn, 2008). (Wansink and colleagues, 2001) The researcher examined that an online restaurant menu that attracts consumers to buy online restaurant menus should have descriptive names, ingredients, and food preparation methods for the current study.

Desire for food

The term "desire for food" refers to a strong desire to consume food (Pelchat et al., 2004). Hunger, seeing images of food in the media, and watching others eat all influence the desire to eat food (Burger et al., 2011). Furthermore, hunger can sometimes contribute to negative emotions, but once satisfied, people feel better (McCormack and Lindquist, 2019). When people are stressed, they eat to try to alleviate their feelings (Cardi et al., 2015; Van Strien and Ouwens, 2007), and higher food intake occurs in response to negative emotions (Van Strien and Ouwens, 2007).

Food craving is another term for the desire for food. A problematic term for food addictions is "food craving." Physiol Behav. 2016, Rogers PJ, Brunstrom JM. Appetite and energy balancing. However, food craving can also refer to a desire for a specific food. Not yet going to the store, but already imagining how the food's appearance, taste, and attractiveness exaggerates the feeling of desire for the food. Wageningen Academic Publishers, Wageningen, 2014.

Research Hypothesis

The literature review highlighted that the independent variables like menu visual appeal, menu informativeness, and desire for food affect the online restaurant menus in Klang valley. Based

on the literature discussed, the hypotheses of this study were summarized in the following manner:

H₁ There is a significant relationship between menu visual appeal and purchase intention.

H₂ There is a significant relationship between menu informativeness and customers' purchase intention.

H₃ There is a significant relationship between the desire for food and customers' purchase intention.

**Research Framework**

Figure 1 below shows the research framework used for this study.

Figure 1.1: Conceptual Framework
Source: Framework adopted from Yusof (2016)

METHODOLOGY

Research Design

A questionnaire is used in this study to collect data in a quantitative method. The questionnaire is available in two languages, which are English and Malay. The survey had three sections with a total of 25 questions. Five multiple-choice questions were included in the first segment, which is a demographic profile. Twenty items with menu visual appeal, menu informativeness, and desire for food on consumers' purchase intentions in Klang Valley, Malaysia were included in the second and third sections on independent and dependent variables. The questionnaire uses a 6-point Likert scale for simplicity and ease of administration. The Likert scale ranges from 1 to 6, with 1 representing "Strongly Disagree" and 6 representing "Strongly Agree." The questions were adapted from previous research (P. Brewer and A.G. Sebby) that measured consumers' purchase intentions in the Klang Valley, Malaysia. They included visual menu appeal, menu informativeness, and desire for food. As a result, the instrument is regarded as trustworthy.

Data Collection

Before fieldwork, pilot testing was undertaken with 30 respondents in the Klang Valley to ensure the study's reliability. The fieldwork was subsequently conducted by randomly distributing questionnaires to 384 target respondents who consented to return to Klang Valley restaurants. Respondents were expected to use the six-point Likert scale to answer all questions. The data is collected once the respondent has completed all of the questionnaires. To protect the information obtained, researchers personally collected questionnaires from respondents. The final questionnaires revealed a 72.6 % response rate with a total of 279 usable questionnaires.

Sampling

The data for this study were collected using convenience sampling as a sample method. The goal of convenience sampling is to find individuals who live nearby and are willing to participate in the study. In brief, the sample size would be 384 persons based on the rule of thumb proposed by Krejcie & Morgan (1970).

Data Analysis

The quantitative data collected from respondents were analysed using SPSS version 24.0. The data on the demographic profiles of the respondents are being analysed using frequency analysis. Descriptive analysis was used to identify and investigate consumers' purchase intentions in Klang Valley restaurants, and Pearson's Correlation was used to investigate the relationship between menu visual appeal, menu informativeness, and desire for food in consumers' purchase intentions in Klang Valley restaurants. Findings with a p-value less than or equal to 0.05 were considered statistically significant, and the hypotheses could be accepted.

FINDINGS

Result of Frequency Analysis

Table 1

Demographic Profile (n=279).

Characteristics	Frequency	Percentage (%)
Gender		
Male	71	25.2
Female	211	74.8
Marital Status

50 and above	30	10.6

Elaboration: The characteristics of respodents are gender, marital status, religion, ethnicity, and age.

Result of Descriptive Analysis

Table 2
Mean, Standard deviation (SD) of items and variables (n=279).

Variable	Items	Mean Score	Standard Deviation
Menu Visual Appeal	The way this restaurant displays its online menu is attractive	5.0645	0.95367
	The online menu is visually appealing	5.1254	0.89886
	This online menu has a nice look and feel to it	4.9427	1.05101
	This online menu's design appeals to me	5.0717	0.99381
	This online menu's graphics appeal to me	5.1075	0.97223
Menu Informativeness	This restaurant's online menu is well presented and helpful	5.0323	0.98680
	The food on the menu is well described	4.9355	1.02283
	The menu lists all of the ingredients as well as the procedures used to prepare the cuisine	4.7204	1.34939
	The menu gives potential diners a complete image of the cuisine available	4.8925	1.07083
	The menu gives me enough information to determine whether the cuisine on offer is appropriate for my appetite	4.9211	1.12567
Desire For Food	The menu made my mouth water	5.0609	0.9994
	The menu whetted my appetite	5.0753	0.97342
	I feel hungry after looking the restaurants menu	4.9498	1.09166
	I felt compelled to grab and eat the meal when I saw the menu	4.9749	1.05398
	When I viewed the menu, I had and overwhelming desire to eat everything	4.8674	1.15381

Result of Reliability Analysis
Table 3

Variable	Number of Items	Cronbach Alpha
Menu Visual Appeal	5	0.921
Menu Informativeness	5	0.935
Desire For Food	5	0.935

Elaboration: Menu visual appeal is lowest than menu informativeness and desire for food, according to Cronbach Alpha.

Result of Pearson Correlation Analysis
Table 4
Pearson's Correlation between menu visual appeal, menu informativeness and desire for food on consumers' purchase intentions.

Hypothesis	P-Value	Result (Supported/Not Supported)
H₁: There is significant relationship between menu visual appeal and customers' purchase intentions	0.821	H1 is supported
H₂: There is a significant relationship between menu informativeness, and customers' purchase intentions	0.831	H2 is supported
H₃: There is significant relationship between the desire for food and customers purchase intentions	0.867	H3 is supported

Elaboration: All three hypothesis are supported for the P-Value.

DISCUSSION & RECOMMENDATION
Recapitulation of the Findings
Menu Visual Appeal

RO1   To examine the effect of the menu's visual appeal on consumers' purchase intentions in Klang Valley, Malaysia.

RQ1   What is the relationship between menu visual appeals and consumer purchase intentions in Klang Valley, Malaysia?

H1   There is a significant relationship between menu visual appeal and customer purchase intention in Klang Valley, Malaysia.

The Pearson's Correlation value (r-value) of menu visual appeal on customer purchase intention is strong (0.821), whereby the p-value is 0.000 ($p < 0.05$). This indicates that visual menu appeal is significant and positively related to customer purchase intention but is the lowest among the three variables. The average mean score for menu visual appeal is the highest reported at 5.0624. The respondents agreed that the menu's visual appeal is authentic and stimulates purchase incentives. Therefore, menu visual appeal facilities customers to choose their favourite food to purchase. Thus, the hypothesis is accepted whereby the relationship between menu visual appeal and customer purchase intention in Klang Valley is significant. As a result, the findings have met the first research objective, answered the first research question, and fully supported the first research hypothesis.

Menu Informativeness

RO2   To examine the effect of menus and menu informativeness on consumer's purchase intentions in Klang Valley, Malaysia

RQ2   What is the relationship between online restaurant menus and menu informativeness in Klang Valley, Malaysia?

H2   There is a significant relationship between menu informativeness and customer purchase intention in Klang Valley. Malaysia

The Pearson's Correlation value (r-value) of menu informativeness is 0.831, indicating a positive, strong relationship in determining customer purchase intention in Klang Valley, Malaysia. Since the p-value is less than 0.05 (0.000), the relationship between menu informativeness and customer purchase intention is significant, supporting the study's hypothesis. On the other hand, the average means for menu informativeness is the lowest reported at 4.9004.

The menu is borrowing techniques from the retailing industry that make items stand out as if to say, "Buy me." (David V. Pavesic, 2009). Proper menu informativeness can direct the diner's attention to specific items and increase the likelihood that those items will be ordered. It made researchers realize that menu informativeness is key to business success. As a result, the findings have met the second research objective, answered the second question, and fully supported the second research hypothesis.

Desire for Food

RO3	To examine the effect of menus and the desire for food on consumers' purchase intention in Klang Valley, Malaysia
RQ3	What are the relationships between online restaurant menus and the desire for food in Klang Valley, Malaysia?
H3	There is a significant relationship between the desire for food and customer purchase intention in Klang Valley, Malaysia

Pearson's Correlation value (r-value) was reported at 0.867, which indicates a positive, strong relationship. Meanwhile, the p-value is below 0.05 (0.000), showing a significant relationship between the desire for food and customer purchase intention. Hence the hypothesis is accepted. The average mean score for the desire for food is 4.9857. The desire to taste the food is a customer's behaviour to decide whether to buy or not. As a result, the findings have met the third research objective, answered the third research question, and fully supported the third research hypothesis.

Implication of the Study

The purpose of this study was to look at the factors that influence the effect of online restaurant menus on consumers' purchase intentions in Malaysia's Klang Valley. Th, the food and beverage business, and future clients of Klang Valley restaurants were among those who benefited from the consumers' purchase intentions in Klang Valley, Malaysia. The researcher will concentrate on the relationship between the dependent variable, which is consumers' purchase intentions, and the independent variables, which include menu visual appeal, menu informativeness, and desire for food, throughout this studyroughout this study, the researcher will concentrate on the relationship between the dependent variable, which is consumers' purchase intentions, and the independent variables, which include menu visual appeal, menu informativeness, and desire for food.

Firstly, for the new researcher or entrepreneur interested in this topic, this research study supplied all of the necessary facts, particularly on how visual menu appeal, menu informativeness, and desire for food influence consumers' purchase intention. This information will help the researcher determine what factors impact consumers' purchase intentions in Klang Valley, Malaysia. Furthermore, this research enabled the new researcher to identify crucial variables that have yet to be examined but can influence the consumers' purchase intention. Due to the findings of this study, future researchers may be able to select research findings that have a higher chance of being efficient in this research area. In fact, by referring to this research report, future researchers may develop an instinct for conducting research. Additionally, this research report could serve as a model for future literature reviews.

Second, the food and beverage industry benefits from this research because it provides information on the factors that influence the effect of online restaurant menus on consumers' purchase intention in Klang Valley, Malaysia. By responding to customer expectations about

menu visual appeal, menu informativeness, and the desire for food, restaurant operators can determine the effect of an online restaurant menu on consumers' purchase intention. As a result, restaurant operators must perform significant research about consumers' purchase intention, especially those who frequently return to restaurants, to completely satisfy the consumer's desire. As a result, the food and beverage industries can gain competitive advantages and profit by making more intelligent decisions.

Finally, by influencing online restaurant menus' effect on consumers' purchase intention in Klang Valley, Malaysia, the analysis of these findings benefits future customers. This research may also help future consumers better understand the elements that influence their purchase intention. This study explains the factors to consider when consumers plan to return to a restaurant to determine what factors influenced their intention. Because the true purchasing intention of the restaurant is proven in this research, future consumers will know what they want when they browse online restaurant menus.

Limitation of the Study

Several challenges and limitations were encountered in this research study, which should be highlighted for future research purposes. Firstly, researchers have faced challenges, such as time constraints, insufficient respondents, accessibilities, and communication barriers. The questionnaire was open to anyone with experience using online food delivery services. Besides, respondents are also limited to only those who used online food delivery or about online food delivery.

Secondly, the primary data for the study was collected via an online questionnaire; however, researchers were unable to determine the truthfulness of the respondent while answering the questionnaire using this method. This eventually led to invalid findings that had to be excluded from the study. This questionnaire may also be answered by others if distributed outside Malaysia if they have external contacts and may exceed the target respondents studied by the researcher.

After that, aside from the three independent variables (visual menu appeal, menu informativeness, and desire for food) that were included in the study, there was still a slew of additional factors that could influence consumer purchase intention. However, because the researchers only have a limited amount of time to explore more variables, this study primarily focuses on three primary independent variables. It comprises food characteristics, food prices, and the ease with which food may be purchased.

Finally, this study is limited to those with previous experience with online food delivery in the Klang Valley. As a result, the study's findings may not be representative of the entire community, particularly customers from other states in Malaysia who may not share the same views on their consumers 'purchasing intentions.

Recommendations for Future Research

Some of the challenges and limitations encountered in the study and some recommendations will be highlighted for future research purposes. In this study, the researchers only made coverage in the Klang Valley that may influence customers 'purchase intentions of online restaurant menus. Future research should consider the survey's location, as customers from different states in Malaysia may have different opinions due to differences in demographic profiles. This is because some places will not be affected to buy after seeing the online restaurant menu ads. This is because they have been exposed to online restaurant menu ads.

Furthermore, another study is proposed to study specifically on adults, one of the restaurant's regular customers. This is because this group often does not have time to cook at home due to busy work and lack of time. The advancement of technology and the problem of preparing online restaurants provides a solution faced by today's adults. Moreover, this study only focused on the consumer's point of view. Future research may examine these factors from a restaurant perspective to better understand the impact of online restaurant menus on customers 'buying intentions. This is because restaurants play an essential role in ensuring the best service to customers primarily through online restaurants.

CONCLUSION

The purpose of this study was to look at the factors that influence the effect of online restaurant menus on consumers' purchase intentions in Klang Valley, Malaysia. The findings revealed that the three variables are substantially related to consumers' purchase intentions, with visual menu appeal, menu informativeness, and desire for food having the strongest relationships. Although most respondents felt that their desire for food influenced their restaurant's purchase intentions the most, it was discovered that the relationship between menu visual appeal and menu informativeness has a substantial impact on consumers' purchase intentions. According to the study findings, consumers will buy through the online menu in Klang Valley restaurants based on the study variables, which include menu visual appeal, menu informativeness, and demand for food. As a result, the research objectives were achieved.

ABSTRACT

Mobile applications are digitally crucial to customers because of advances in mobile technology, mobile access to high-speed internet, and the interactivity of mobile phone interfaces. The mobile applications experience is critical in the the hospitality industry, but the mechanism of customer intention development is still unknown. This study aims to examine the relationship between interactivity, functionality and perceived ease to use of mobile applications to perceived security and privacy. There are 335 respondents from Universiti Malaysia Kelantan (UMK) Pengkalan Chepa of FHPK students involved to answer the questionnaires conducted by the researcher. Google Forms was used to distribute the questionnaire and collect the data. The data collected through questionnaire surveys and SPSS software were used for the decision analysis. Descriptive analysis, reliability test and inferential analysis, which is Pearson correlation, were performed in this study. The findings showed that the interactivity, functionality, and perceived ease to use have a relationship with a p-value less than 0.001. The result indicates a significant relationship between interactivity, functionality and perceived ease to use of mobile applications to perceived security and privacy. The researchers have proposed a few recommendations related to the study.

Keywords: Mobile Applications, Interactivity, Functionality, Perceived Ease to Use, Hospitality Industry, Digitally

INTRODUCTION

Mobile applications have become an inseparable part of our daily lives. Mobile applications are digitally crucial to customers because of advances in mobile technology, mobile access to high-speed internet, and the interactivity of mobile phone interfaces. From communicating to funny, mobile applications provide some key activities that cause customers to spend a lot of time using them (Reychav, 2019). Every day, new mobile applications are released in the app store to meet customer demand for online shopping, gaming, financial management and other services that may be performed using mobile applications (Balapour, Reychav, Sabherwal, & Azuri, 2019).

The subject of the research is to explain the issues arising in mobile application interaction. In the hospitality business, mobile applications are divided into various application areas. Mobile applications are divided into opportunities and potential issues to strengthen customer security from irresponsible parties gaining access to specific personal data (Alom et al., 2019). These issues have been categorised to be addressed, and they have been discussed to improve people's impressions of the security and privacy of mobile applications in the hospitality business. Furthermore, customers who perceive privacy threats will be unwilling to register and refuse to disclose personal information to the company due to this issue.

Significance of the Study

Hotel Industry

Mobile applications can influence the customer experience in the hotel business. Because of the improved and unmatched comfort throughout their stay, mobile applications play a vital role in attracting new hotel customers and retaining existing ones. Due to the advent of mobile

applications, the quality of the visitor experience has improved dramatically, and the customer database has grown tremendously. The hotel may attract more customer attention and appeal to a bigger audience by establishing a mobile application that makes it easier for hotel customers to access services.

Customers

Mobile applications that offer self-service features and gather customer data can also help to improve hotel staff efficiency. Customers want to be able to choose how they interact with hotel staff and services. For example, many people would prefer to check in on their mobile applications rather than wait in line at the front desk. For customers who want to use their devices to organise their hotel experience, there can be fewer direct interaction points with staff, meaning there is more opportunity to allocate labour to other operational areas. Furthermore, many services that currently require staff to manually complete tasks, such as book reservations and valet requests, can be handled via mobile applications. As already mentioned, data gathered from a customer using the app can also help inform where and when more resources need to be allocated.

Travellers

Many hospitality companies launched mobile applications to reach out to potential customers. For example, Southwest Airlines allows its customers to reserve, change, cancel flights and check in using its mobile application (Southwest Airlines Co., 2015). In the traveller, mobile applications could do much more than simply provide information about specific locations or recommend places and itineraries based on the user's location. Travellers may use their mobile applications to purchase any service, like ordering an airline ticket, a hotel, a cab, or even creating a complete travel plan. Furthermore, carrying a smartphone everywhere is more convenient than carrying a lot of tourist guidebooks, documentation, and plans. Furthermore, the traveller may share their experiences with others regarding the service quality, cost, and experience while using any service, from plane tickets to rail tickets to hotel reservations.

LITERATURE REVIEW

Interactivity

Interactivity defines deals with the influence of engagement, interest, and appeal that may be an intrinsic characteristic in technology-mediated groups (Barreda, 2016). In this definition, interactivity is an essential high-tech capability to establish long-term relationships with its users (Neelotpaul, 2015) and the primary determinant of building an online brand (Voorveld, 2017). It allows reciprocal communication with other systems and users. Interactivity also deals with mobile applications designed as human attempts to structure the environment and create interaction between people. Interactivity also refers to emphasis on application interaction by bringing out user interactions (Sundar, 2010).

Interactivity can also be seen as a two-way communication flow that allows customers to respond, synchronise, and control. Two-way communication is conceptualized as a two-way information flow that allows the customers to respond (Kim, 2016). Interactivity has also been embraced, and scholars in the subject of interaction are very interested in seeing how well customers can participate in real-time changes in shape and content environments (Mollen & Wilson, 2017). Another critical aspect of the interactivity construct is controllability or customer control. Customer input and choice capacity (Yoo, 2015) is conceptualized as the ability of customers to determine the timing, topic, and sequencing of communications (Dholakia, Zhao, Dholakia, & Fortin, 2017).

Functionality

Functionality refers to the extent to which technology or system can aid customers in completing their intended goals (Wong, 2018). The ability of a computer programme or application to do a specific task or the number of operations it can carry out (Collins, 2017). The goal of functional mobile app design is to promote client satisfaction. For example, style and functionality, should ideally work together to make it easy for customers to explore mobile applications and access the most essential functionalities without being distracted by too many options (Ewen, 2019).

Several hotels have adopted a mobile-first strategy. They recognised that mobile applications are an excellent way to encourage potential customers to book rooms, check availability, learn about hotel services, read reviews, browse hotel images, and more (Chiang, 2017). Similarly, mobile applications are a great way to give customers a quick booking experience while keeping them updated about special discounts, events, and other information through regular mobile applications notifications (Jang, 2017). Hotels may also employ mobile applications to market their resorts and services to a far bigger audience in a fun and engaging ways. Customers may enjoy a seamless browsing experience on their smart devices due to the adoption of mobile applications without having to wait for a desktop computer (Linton, 2015).

Perceived Ease of Use

In the sphere of electronic banking, the relevance of perceived utility has long been acknowledged (Guriting and Ndubisi, 2006). Perceived ease of use (PEOU) is considered as the central element of technology adoption and technologythe central element of technology adoption and utilization behaviour. Perceived ease of use (PEOU) could be described as, a point where a person accepts that the application of a detailed system will be liberated of exertion, and simple to comprehend or utilize (Davis, Jen & Hung 2015). The technology acceptance model (TAM) was used to understand consumers' sustainability label usage behaviour for apparel products (Davis et al. 1989). The TAM depicts the relationships between perceived ease of use (PEOU), perceived usefulness (PU), and attitudes with behavioural intention (BI).

In hospitality and tourism information systems research, Perceived ease of use (PEOU) is a critical aspect of technology acceptance and utilisation (Bilgihan, Barreda, Okumus, & Nusair, 2016). PEOU is a widely used concept that refers to a customer's evaluation of the effort required to complete a technological task (Venkatesh, 2017). The desire to utilise mobile applications is positively influenced by perceived ease of use (PEOU) (Okumus & Bilgihan, 2015). PEOU denotes the degree to which customers believe the technology is simple to use, whereas PU denotes the degree to which customers believe the technology is useful (Davis et al. 1989). TAM theorises that PEOU and PU influence the formation of favourable associated with the use of technology, which, when paired with PU, leads to people's enhanced BI to use it. PEOU is also expected to positively influence people's perceptions of the technology's utility (Davis, 1989).

Perceived Security and Privacy

Perceived security and privacy refer to the degree to which users believe that a mobile application platform is secure regarding both financial aspects and personal information (Hartono, Holsapple, Kim, Na & Simpson, 2014). Perceived security and privacy refers to using mobile applications that appear to have specific security and privacy sensitivities to customers, particularly social networks, online banking and data customers (Fife, 2015). Concerning the diversity of definitions, people's perceptions of security and privacy on mobile applications are subjective variables. Hartono, Holsapple, Kim, Na & Simpson (2014) defined the notion of security and privacy as the ability of customers to trust that their data will not be disclosed at will by hotel owners who will take good care of customers' personal information. Perceived

security and privacy should not be taken lightly as it is the perception of customers that should be emphasized towards a hotel when they use mobile applications.

To deliver hospitality services highly, hospitality services companies must track customers' preferences, behaviours, and whereabouts (Kansakar, 2019). Hospitality service companies must ensure that customer data is managed and preserved appropriately to safeguard customers' data from physical, economic, and societal threats. The system that interacts with customers is the most susceptible in a hotel. This technology should ensure that customer interaction are safe and confidential by applying thorough security measures to avoid data leakage and theft (Munir, & Shabani, 2019). This will impact how customers react to perceived security and privacy when using mobile applications (Zhang, 2019).

Research Hypothesis

In this study, the following three hypotheses have been demonstrated based on the objectives of the study:

H₁ There is a positive relationship between interactivity of perceived security and privacy.

H₂ There is a positive relationship between functionality with perceived security and privacy.

H₃ There is a positive relationship between perceived ease to use of perceived security and privacy.

Research Framework

The framework has to identify the factor of perceived security and privacy as the independent variables (IV), such as interactivity, functionality and perceived ease to use and perceived security and privacy as the dependent variable (DV). The framework is used to study the direct effects of the relationship between interactivity, functionality and perceived ease to use.

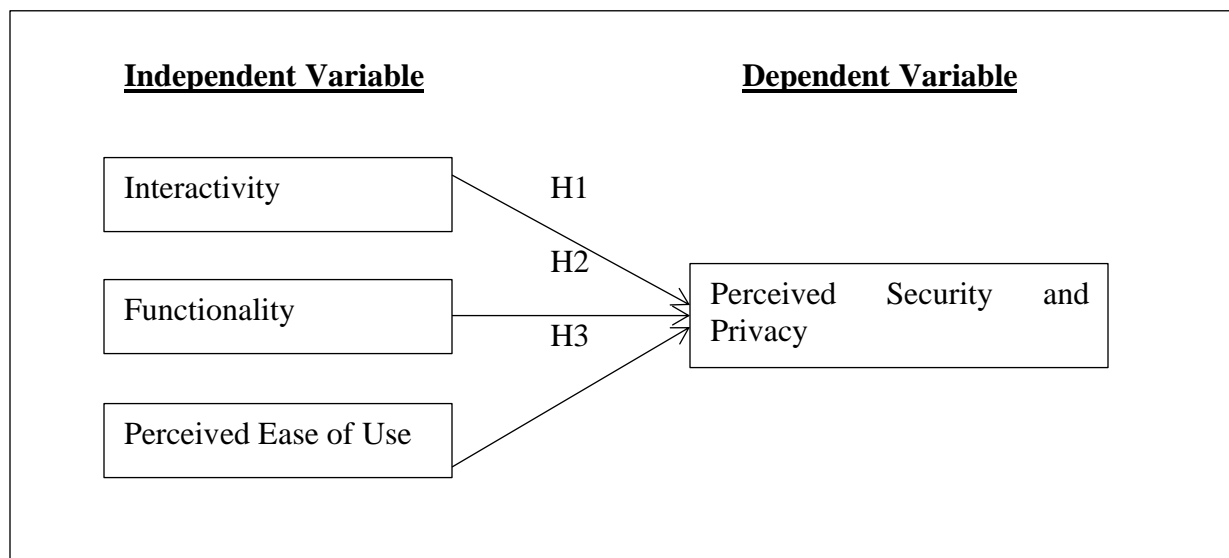

Figure 14: Research Framework

METHODOLOGY

Research Design

The research design refers to the overall strategy utilized to carry out research that defines a concise, and logical plan to tackle established research questions through the collection, interpretation, analysis, and discussion of data. This study focused on descriptive research. This study used the quantitative research to collect data on perceived security and privacy on

interactivity, functionality and perceived ease to use mobile applications. Quantitative research is the process of collecting and analysing numerical data. It can be used to find the patterns and averages, make predictions, test causal relationships and generalize results to broader populations. This is because quantitative research strategy means there will be continuous and distinct numeric data.

Data Collection

Data collection is a method for assembling and measuring data from a variety of sources to obtain comprehensive and accurate data. Data collecting allows an individual or organization to answer relevant questions, evaluate results, and make predictions about future probability and trends. The researchers will conduct and distribute the questionnaire online to students from the course Hospitality, Tourism and Wellness, which are from year 1 until year 4 at University Malaysia Kelantan (UMK).

Sampling

In this research, the researchers selected a non-probability sampling technique, which is snowball sampling. Non-probability is a sampling technique in which the researcher chooses samples from the subjective assessment of the researcher instead of from a random point of view. Snowball sampling is a technique in which samples are taken from a sampling frame.

Data Analysis

The tool used in analyzing the data is a statistical tool, or Statistical Package Social Science (SPSS), programmed version 25 computer software. The SPSS software helps the researcher determine the best statistical technique to use. SPSS data will interpret into statistics such as good percentage and cumulative percentage.

FINDINGS

Result of Frequency Analysis

The table 1 shows the result of frequency analysis.

Table 54: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	151	45.1
Female	184	54.9
Age		
18 – 20 years old	64	19.1
21 – 23 years old	238	70.0
24 – 26 years old	33	9.9
Race		
Malay	144	43.0
Chinese	100	29.9
Indian	86	25.7
Other	5	1.4
Are You a User of Mobile Applications?		
Yes	335	100.0
No	0	0

What Mobile Applications Do You Usually Use To Find A Hotel Online?		
Trivago	112	33.4
Agoda	102	30.4
Bookings	94	28.1
Others	27	8.1
How Do You Check-In The Hotel?		
Mobile apps	142	42.4
Self-check-in	133	39.7
Counter	60	17.9
How Do You Manage Your Online Booking?		
Mobile apps	148	44.2
Self-check-in	90	26.9
Counter	97	29.0

Table 1 shows the frequency analysis characterization of respondents. 151 out of 335 respondents are male, which represents 45.1% of the total the sample, while 184 respondents are female, representing 54.9% of the total sample. There were 64 (19.1%) respondents aged 18 - 20 years old, while the majority of respondents were in the age range of 21 - 23 years old, which are 238 (70.0%) respondents and only 33 (9.9%) respondents were reported in the age of 24 – 26 years old. Next, the majority of respondents are Malay, with 144 (43.0%), followed by Chinese, with 100 (29.9%) respondents. There were also Indian with 86 (25.7%) respondents, and other races, namely Kadazan, Iban, and Sikh, represented 5 (1.4%) of total respondents. Besides, all respondents answered yes, which is 335 (100.0%) respondents to the question you are a user of mobile applications. Next, the majority of respondents who answer this question use Trivago, with 112 (33.4%), followed by Agoda, which is 102 (30.4%) respondents. From mobile applications of Bookings with 94 (28.1%) respondents and others in this part, namely, OYO represented 27 (8.1%) of total respondents. Besides, the majority of respondents in this part use Mobile apps with 142 (42.4%), followed by Self-check-in with 133 (39.7%) respondents, and Counter with 60 (17.9%) respondents. Lastly, the majority of respondents answered this question from the Mobile application with 148 (44.2%), followed by Self-check-in with 90 (26.9%) respondents and Counter with 97 (29.0%) respondents.

Result of Descriptive Analysis

Table 2 below shows the result of the descriptive analysis.

Table 55: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Interactivity	I believe mobile applications can be interactivity to customers in terms of perspective.	5.34	0.969
	I believe interactivity is two-way communication and becomes an important feature of mobile applications.	5.41	0.924
	I am confident that interactive contact can be done either with other customers or with other online organizations.	5.46	0.959
	I am sure that interactivity is also focused on the other consistently which is receiving and	5.36	1.034

	replying to its messages on the mobile applications.		
	I believe interactivity is an important feature for customers in order to help improve their efficiency.	5.44	0.974
	I aware the mobile application is smooth and easy to understand for the customers when interact with others.	5.41	0.940
	I am confident that interactivity can be achieved when they use the mobile application.	5.39	0.925
Functionality	Mobile applications provide information that is simple to understand and use for customers.	5.47	0.921
	The functionality mobile applications help a lot of customer to booking their hotel.	5.46	0.917
	Mobile applications can help customers check in faster and save their time.	5.39	0.915
	Mobile applications fulfil my expectations and meet my requirements.	5.37	0.957
	I am satisfied with mobile applications when I use throughout the trip.	5.42	0.947
Perceived Ease of Use	For me, learning to operate a mobile applications is ease to use.	5.50	0.935
	It would be easy for me to become skilled when using the mobile applications.	5.49	0.909
	I found that mobile applications to do what I want it to do is easy.	5.51	0.875
	By using mobile applications, my interaction would be clear and understandable.	5.41	0.946
	I would found that the mobile applications to be flexible to interact with.	5.55	0.894
	I would find that mobile applications easy to use.	5.47	0.908
Perceived Security and Privacy	I am aware that, the hotel has a clear security policy about "bring your own device" at the hotel.	5.43	0.945
	I have sufficient knowledge about the hotel's security policy regarding corporate communication conducted on mobile applications.	5.54	0.857
	I know that the hotel has implemented appropriate steps to secure mobile applications I use in the hotel.	5.64	0.829
	I am aware that the hotel has a clear policy regarding disaster recovery plan in case I experience security breach on mobile devices I use in the hotel.	5.54	0.904
	I am aware of the hotel's deployed Mobile Device Management that secures, monitors,	5.60	0.899

	manages, and supports the protection of data on mobile applications.		
	I'm aware that the hotel places limitations on corporate data that workers can access on their personal mobile applications.	5.50	0.975
	I'm aware that the hotel has a good handle on enforcing security and privacy measures to access sensitive or confidential data.	5.66	0.904
	I'm aware that security software on all mobile applications used in the hotel is updated on a regular basis.	5.62	0.917

Table 2 shows the descriptive analysis of the individuals' perceived security and privacy of mobile applications in the hospitality industry. The mean range for the interactivity is from 5.34 – 5.46, and the standard deviation is from 0.924 - 1.034. Eight (7) questions were measured with the highest mean of 5.46 agree for question number 3 on the statement 'I am confident that interactive contact can be done either with other customers or with other online organizations'. Meanwhile, the lowest mean with 5.34 was for question number 1, which agrees with the statement that 'I believe mobile applications can be interactivity to customers in terms of perspective'. The mean values for the other five (5) questions for numbers 2, 4, 5, 6 and 7 were 5.41, 5.36, 5.44, 5.41, and 5.39, respectively.

Next, the mean range for the functionality is from 5.37 – 5.47, and the standard deviation is from 0.915 – 0.957. Five (5) questions were measured with the highest mean of 5.47 agree for question number 1 on the statement 'Mobile applications provide information that is simple to understand and use for customers'. Meanwhile, the lowest mean ,5.37 was for question number 4 agrees with the statement that 'Mobile applications fulfil my expectations and meet my requirements. The mean values for the other three (3) questions for numbers 2, 3 and 5 were 5.46, 5.39 and 5.42, respectively.

Besides, the mean range for the perceived ease of use is from 5.41 – 5.55, and the standard deviation is from 0.875 – 0.946. Six (6) questions were measured with the highest mean of 5.55 agree for question number 5 on the statement 'I would found that the mobile applications to be flexible to interact with'. Meanwhile, the lowest mean, with 5.41, was for question number 4, which agrees with the statement that 'By using mobile applications, my interaction would be clear and understandable. The mean values for the other four (4) questions for numbers 1, 2, 3 and 6 were 5.50, 5.49, 5.51, and 5.47, respectively.

Lastly, the mean range for perceived security and privacy is from 5.43 – 5.66, and the standard deviation is from 0.829 – 0.975. Eight (8) questions were measured with the highest mean of 5.66 agree for question number 7 on the statement 'I'm aware that the hotel has a good handle on enforcing security and privacy measures to access sensitive or confidential data'. Meanwhile, the lowest mean, with 5.43, was for question number 1, agreeing with the statement that 'I am aware that the hotel has a clear security policy about "bring your own device" at the hotel'. The mean values for the other six (6) questions for numbers 2, 3, 4, 5, 6 and 8 were 5.54, 5.64, 5.54, 5.60, 5.50 and 5.62, respectively.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis.

Table 56: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Interactivity	7	0.885
Functionality	5	0.836
Perceived Ease of Use	6	0.861
Perceived Security and Privacy	8	0.884

Table 3 shows the reliability analysis of the individuals' perceived security and privacy of mobile applications in the hospitality industry. The Cronbach's Alpha values of the variables questionnaire were above the acceptance level (i.e. 0.70), with the value range between 0.836 - 0.885. The first independent variable, Interactivity, was found to be good reliable (7 items; α = 0.885). The second independent variable, Functionality, showed good reliability (5 items; α = 0.836). The third independent variable, Perceived Ease to Use, showed a good reliability (6 items; α = 0.861) and the dependent variable, Perceived Security and Privacy, was found to be good reliability (8 items; α = 0.884). As a result, the data was considered suitable for further analysis.

Result of Pearson Correlation Analysis

Table 4 below shows the result of Pearson correlation analysis.

Table 57: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported / Not Supported
H₁: There is a positive relationship between interactivity of perceived security and privacy.	0.748	H₁ is supported
H₂: There is a positive relationship between functionality with perceived security and privacy.	0.779	H₂ is supported
H₃: There is a positive relationship between perceived ease to use of perceived security and privacy.	0.790	H3 is supported

Table 4 shows the Pearson correlation analysis of the individuals' perceived security and privacy of mobile applications in the hospitality industry. There is a significant high positive relationship between perceived security and privacy interactivity with 0.748. Next, there is a significantly high positive relationship between the functionality of perceived security and privacy with 0.779. Lastly, there is a significantly high positive relationship between perceived ease of use of perceived security and privacy with 0.790. All the significant positive relationships indicated that respondents are well- accepted the individuals perceived security and privacy of mobile applications in the hospitality industry.

DISCUSSION AND RECOMMENDATION

This study only discusses some factors on the relationship between individual perceived security and privacy of mobile applications in hospitality. Therefore, researchers studied factors such as interactivity, functionality and perceived ease to use. The results of the analysis of the study can show the number of university students who experience using mobile applications while booking their hotel. For suggestions, future studies could use other variables to reduce the problem while booking the hotel. For example, mobile room key. There are a couple of advantages to having a mobile room key. First, the obvious one is the convenience of it. The second, which is less discussed, is the security part of it. Traditional hotel room key cards can be lost and can also be hacked wirelessly, causing security issues for guests. In the case of mobile room keys, even if you lose your phone, it's theoretically more challenging for someone to hack into your phone than a standard room key for an experienced thief. (Terri Miller, 2018).

Future researchers could use this topic to create future studies to show the relationship between interactivity, functionality and perceived ease of use with perceived security and privacy. Researchers hope that future studies will maintain the method in collecting data quantitatively from the intended respondents. This is because researchers have selected the population among university students at UMK as many as 335 students and located in Kelantan. Therefore, the data were collected using an online questionnaire method to prevent the spread of the Covid-19 outbreak. Research done in the future is highly encouraged to use this method because researchers have now successfully conducted this study. Throughout the data collection, the researchers found that respondents were more inclined to fill out online questionnaires than written ones. This is because most researchers only use English and Malay to conduct the questionnaire. In addition, researchers can also use various languages such as Mandarin and Tamil in future questionnaires. This can make it easier for the Chinese and Indians to understand better the questions and not cause stress when answering the questionnaire by the respondents. Indirectly, researchers can further increase the level of foreign languages to make it easier to communicate between races.

CONCLUSION

The primary purpose of this research is to examine the relationship between interactivity, functionality and perceived ease of use with perceived security and privacy. According to the result, interactivity, functionality, and perceived ease of use are independent variables, and it is caused by influences on the dependent variable, which is perceived security and privacy. The Chapter 3 also mentions the total number of 335 respondents administered among the university students in UMK. The population of respondent were focused on students from the faculty of Hospitality, Tourism and Wellness. Next, in Chapter 4 ,the findings of results from the questionnaire survey that analyzed using descriptive and inferential analysis. The data obtained from the questionnaire has been evaluated by a software program using Statistical Package for the Social Science (SPSS). Lastly, Chapter 5 summarises the results based on data analysis. Thus, all hypotheses such as H1, H2, and H3 stated are accepted. In addition, limitations and recommendations when carried out this research also include that can be used for further studies.

ABSTRACT

E-learning has evolved into an educational tool, much like technology has evolved and improved over time. Major changes in their environments have presented significant challenges to higher education institutions, including hospitality and tourism programmes. Students face some problems or technical difficulties when using these systems, and this causes dissatisfaction among the students. This study aims to examine the factors influencing student's satisfaction in using e-learning. The researchers used a quantitative technique and questionnaires by Google Forms to conduct this survey. Statistical Package Social Science (SPSS) version 26.0 are used as a tool for analysing the data. The findings showed the strongest correlation would be the online interaction factor, followed by the system quality factor, and the lowest correlation will be the system quality factor. In this regard, the learning management system should be enhanced to boost online interaction. Collaboration between students and instructors should be the foundation for improved interaction.

Keywords: E-learning, Information Quality, System Quality, Online Interaction, Students' Satisfaction

INTRODUCTION

The government began privatising higher education in the 1980s in order to increase public access to higher education while reducing reliance on the public sector. As a result, Malaysia's private higher education sector is seeing exceptional and unprecedented expansion (Chai & Mei, 2009). In response to the wave of privatisation of higher education, a growing number of educational institutions are beginning to offer tourism and hospitality courses at the diploma, bachelor's degree, and even learning experience levels to meet the demand for skilled employment in the tourism and hospitality sector. By converting theory into practical learning, hospitality management education seeks to enrich students with technically oriented learning.

An e-learning system is now an essential tool for students to improve their learning processes. It's one of the systems that has significantly contributed to the IT industry (Mokhtar, Omar & Yuki, 2020). Learning is now regarded from a more significant viewpoint in general, with the use of technology, particularly the internet, in learning becoming increasingly popular at all levels of education, including schools and higher education institutions. Students today have grown up with access to the internet and digital devices.

Higher education institutions, especially hospitality and tourism programmes, have faced substantial problems as a result of huge changes in their respective settings. When students use these systems, they encounter issues or technological challenges, leading to discontent. Students behave differently than prior generations. As a result, educational practitioners and designers must recognise these distinctions and construct educational offers that are tailored to individual learning patterns, features, and behaviours (Song, 2010).

Quality instructor information is critical for students to comprehend each subject they study (Alom et al.,2019). This study aimed to investigate the influence of students' satisfaction in using e-learning for hospitality and tourism practical-based courses. Educators and academics are interested in students' perspectives and satisfaction with online learning courses. The dominating power result predicting student satisfaction with online courses is interaction-

driven quality rather than information-and-system-driven quality (Mokhtar et al., 2020). There were objectives of this research:

  1. To identify the relationship between information quality and students' satisfaction in using e-learning.

  2. To determine the relationship between technology and system quality and students' satisfaction in using e-learning.

  3. To examine the relationship between online interaction and student's satisfaction in using e-learning.

Significance of the Study

The study looked into the elements influencing student satisfaction with e-learning for practical-based hospitality and tourism courses. According to Cox (2012), as e-learning resources have become more widely available to educators, researchers have focused their efforts on an increasing number of points of view, with many assumptions and limitations surrounding research methodologies used and the subsequent interpretation of findings. Future researchers who want to perform a similar experimental study or any other study involving student satisfaction with e-learning can use the findings as a guide and reference. This requires researchers to thoroughly understand past evidence, theories, and practises to establish what they should be assessing.

  Furthermore, the study's findings will benefit students, professors, lecturers, and the general public. Students appear to benefit from and appreciate online courses that are detailed, logical, and user-friendly (Eom et al., 2006). When the course learning objectives are more specified, students have a better knowledge of the expectations for success and learning in the course. Student research e-learning course benefits show that interactive qualities appear to be crucial in influencing course quality as judged by student performance, grades, and course satisfaction. According to Roblyer and Ekhaml (2001), students do far better in online courses due to the flexibility and reactivity of e-learning.

LITERATURE REVIEW

Overview of E-learning

E-learning is introduced to students enrolled in open and distance learning (ODL) programmes. (Ali, 2004). It's critical to define exactly what e-learning means here. Learning providers can use e-learning applications to help them organise, deliver, and track the overall learning and teaching process. An e-learning system is a substantial reservoir of information because of its accessibility (accessible everywhere at any time), low cost, ease of use, and interactive nature. This emphasises the importance of being clear about what the term "e-learning" means anymore (Almaiah, Al-Khasawneh & Althunibat, 2020). Students can download instructional information onto mobile devices, connecting to mobile networks or local wireless networks. This definition emphasises that e-learning has evolved into a teaching tool, similar to how technology has evolved and developed over time. Surprisingly, there is currently a greater emphasis on technical innovation than on understanding the needs and cognitive strategies of different students and course design. The internet and online learning have advanced dramatically (Tham & Werner, 2005).

  E-learning should always offer current and relevant content. Learners need access to available professionals, the best sources, promptly responding instructors, and quick solution providers through e-learning. In addition, good learning requires effective and engaging learning content (Nagy, 2005). Intensive collaboration is required to exchange critical knowledge and information among partners, specialists, and professional colleagues (Nagy, 2005). As a result, e-learning must move away from a teaching-centred paradigm that encourages great knowledge dissemination by academics and toward a continuing-to-learn strategy. Students are becoming knowledge creators and builders. Aside from that, universities have traditionally had a wide range of instructional methods to choose from. However, given the scope and diversity of having to invent e-learning within universities, which usually

necessitates a strategic and academy methodology for its deployment, they may begin to exert more control over their education. (Knight & Trowler, 2001).

Information Quality

Information quality is defined as how customers perceive and use information, which can be described as useful outputs for business users (Gorla, Somers & Wong, 2010; Miller, 1996). There have been several definitions of information quality offered. Information quality is defined by Cheng (2012) as the accuracy, completeness, currency, efficiency, relevance, scope, and timeliness of information generated by an information system, with aspects such as information accuracy, completeness, currency, efficiency, relevance, scope, and timeliness being assessed.

Students will use the same interactive notes provided by this university because information quality is crucial for receiving accurate and correct information about the course (Adeela, Diana, Fadilah, Huda, Ismail, Jaafar Mokhtar, Rashidah, Sukiman Tahar, Zamani & Zuriati, 2013). The notes are also written by the appointed professors, making them more reliable to be used by students throughout the system (Adeela et al., 2013). Information quality positively impacts use and user satisfaction, which is consistent with findings on the success of e-learning systems (Aparicio, Cidral, Felice & Oliveira, 2017).

Information quality is vital in e-learning systems since the system course comprises the students' learning grounds, and content positively impacts learner satisfaction (Aparicio et al., 2017). The study's participants were all enrolled in university programmes. In contrast, the other study sample included students from various levels of education, and the findings support predictions that information quality has a positive impact on the use and user happiness, which is consistent with similar findings on the success of e-learning systems (Aparicio et al., 2017).

Technology Related and System Quality

System quality is a term used in the automobile industry to describe how far an industry has identified a set of desirable attributes that should be applied to a system in order to improve the product's overall lifecycle performance (Dubey, 2012). In this context, it is critical to specify exactly what system accessibility means. Accessibility, adaptability, simplicity of access, reliability, and response time are all aspects that can be used to assess system quality. (Bayraktaroglu et al., 2014). The success of technology designed to expand organisational knowledge and effectively execute technologies that assist organisational learning is dependent on the success of the technology.

Two critical drivers that promote technology usage are an applicant of information technology in task completion and finds turned into information, as well as perceived simplicity of use (Lee & Lee, 2008; Parka, Roman, Leec, & Chungd, 2009; Roca et al., 2006). Individuals are also motivated to use e-learning when they receive high-quality e-learning services to assist them in overcoming barriers. The quality of an e-learning system's service has been linked to a beneficial impact on technology adoption (Wang & Wu, 2007). End-users become more interested in learning and, as a result, happier when an e-learning system provides useful valuable knowledge for their job duties (Roca et al., 2006).

Furthermore, previous research has demonstrated the effects of perceived quality on learning satisfaction in three different areas of study, as previously indicated in the literature. Each of these has been examined further. User happiness, service support and quality, and the existing system are all considered (Baharudin, Hoon & Tajuddin, 2013). In e-learning contexts, perceived efficacy and anticipation have been proven to be critical. Assume the user had fewer opportunities and achieved greater success with the e-learning system, resulting in increased total user satisfaction. In e-learning, being satisfied with the system's operation leads to higher learning satisfaction, which may help to preserve the system (McKinney et al., 2002).

Online Interaction

Barnes (2000) examines online interactions in terms of affordances and opportunities for action, as well as the appropriate medium for boosting learning, and warns against their drawbacks. A communication-based framework defines the sender and receiver of three types of interactions in online education: learner-content, learner-instructor, and learner–learner (Reeves & Woo, 2007). Online contact is a new type of communication that is neither written nor spoken (Sher, 2009). Like face-to-face communication, computer-mediated communication (CMC) is a real-time interaction in which individuals negotiate meaning by modifying their input and output (Lee & Lina, 2001).

Allowances are a component of online interaction. The term "affordance" was coined by Day and Lloyd (2007) to describe how various technologies support learning by providing structures and opportunities for involvement. Lloyd (2010), for example, discussed how forums and wikis facilitate teacher-student collaboration in the generation of new information and reflective learning, because the capacity to record online exchanges allows for revisiting the experience, which encourages reflection.

A previous study demonstrated a beneficial association between online interaction and student satisfaction with e-learning. Richardson and Swan (2003) found that student satisfaction was influenced by online contact between learner and learner, learner and content, and peer interaction. They feel that emphasising the link between students and educators is vital. Weinert's (2001) research also found that whether or not students engage in meaningful engagement influences the quality of an online encounter. As a result, it is envisaged that peer interaction would influence learning results and satisfaction.

Student's Satisfaction

A person's state of mind after receiving a performance or outcome that satisfies his or her expectations is referred to as "satisfaction." Satisfaction is determined by the relative degree of expectations and how performance is viewed (Ilias, Rahman & Razak, 2008). Student satisfaction with an e-learning system was described by Mokhtar et al. (2020) as "success in the prescribed assignment."

Student satisfaction plays an essential role when teachers, their course programmes, and the overall quality of educational programmes are evaluated (Fernandez et al., 2015). In the context of the e-learning system, students' satisfaction with the quality of the e-learning system is crucial. As a result, various studies have highlighted the relevance of user satisfaction in determining the success of an e-learning system (Samarasinghe, 2012). Satisfaction increases students' motivation as a key "intermediate outcome," and motivation has long been considered one of the most important psychological aspects of academic performance (Babar, Gondal, Qadri & Zaheer, 2015). Peer engagement, student-faculty connection, and a sense of academic inspiration among both the student and the student's peers all have a significant influence on student satisfaction, according to Powers and Rossman (1985). Students' perceptions of online courses can be influenced by a positive attitude and expectations about curricular goals and activities to be achieved (Fernandez et al., 2015).

Research Hypothesis

The hypothesis for this research is to see if there are any significant differences between the independent variable and dependent variable:

H_1 There is a significant relationship between information quality and students' satisfaction in using e-learning.

H_2 There is a significant relationship between technology and system quality and students' satisfaction in using e-learning

H_3 There is a significant relationship between online interaction and student's satisfaction in using e-learning.

Research Framework

Figure 1 below shows the research framework used for this study

Figure 1: Research Framework

METHODOLOGY

Research Design

This research used a quantitative method, with questionnaires delivered to 309 students at the University Malaysia Kelantan. This research's target population comprises UMK students majoring in tourism, hospitality, and wellness practical courses. According to the Faculty of Hospitality, Tourism, and Wellness, there are 1,191 students enrolled in practical courses related to hospitality, tourism, and wellness.

This research aims at the link between information quality, technology and system quality, online interaction as independent variables, and student satisfaction with e-learning as a dependent variable. A survey questionnaire will be used to collect data for this study. Each research subject will be given a personality questionnaire. For the study, the questionnaire will be divided into five sections: A, B, and C. Section A contains demographic data about the respondent, such as gender, age, year, and registered programmes at UMK. Section B will cover the independent variables that influence the student. Meanwhile, section D will concentrate on dependent variables, such as student satisfaction with e-learning for hospitality and tourism.

Data Collection

The data collection was conducted using questionnaires. The researcher addressed the class leader to seek for help passing the questionnaire in the WhatsApp group, which was offered through various platforms such as a WhatsApp group. The online form will be created using Google Forms. Will give the questionnaire to any hospitality, tourism, or wellness faculty member. The researcher would request assistance in disseminating to members of the same faculty or students currently enrolled in hospitality and tourism programmes at the University Malaysia Kelantan (UMK).

Sampling

In this research, the non-probability sampling approach was applied. Non-probability sampling is a method of selecting samples dependent on the researcher's variable instead of random selection. The Snowball sampling technique was employed as a basic sample method by the researchers. Inside this research, researchers will focus on respondents who have used e-learning and are UMK students. To identify the appropriate number of study participants.

Data Analysis

The Statistical Package for the Social Sciences (SPSS) researchers collected and analysed data from the questionnaire form distributed to the respondents. Data analysis may also be divided into descriptive statistics, reliability testing analysis, and correlation analysis.

FINDINGS

Result of Reliability Analysis

Table 1 below shows the result of the reliability analysis

Table 1: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Information Quality	5	0.805
Technology Related and System Quality	5	0.836
Online Interaction	6	0.866
Student's Satisfaction	5	0.824

The Cronbach's Alpha values for the questionnaire were very good (0.8) to excellent (0.9) in Table 4.2. (0.9). The first independent variable, information quality, was determined to be very good and dependable in terms of the degree of correlation (5 items: a = 0.8), as were the technology-related and system quality variables. The last independent variable, online interaction, was similarly determined to be very good and dependable in terms of Correlation strength (6 items: a = 0.8). The dependent variable, student satisfaction, was determined to be very good and trustworthy in terms of correlation strength (5 items: a = 0.8). The overall variables have remained with twenty-one (21) items as the current Cronbach's Alpha result is already above the excellent level. Therefore, the data were considered suitable for further analysis.

Result of Frequency Analysis

The distribution of the respondents in terms of their background characteristics was analysed using descriptive statistics involving frequency and percentage. Table 2 shows the result of the frequency analysis:

Table 2: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	97	31.4
Female	212	68.6
Age		
17 -19	19	6.1
20-22	111	35.9
23-25	179	57.9
Program		
Hospitality	123	39.8
Tourism	112	36.2
Wellness	74	23.9
Year		

1		41	13.3
2		48	15.5
3		178	57.6
4		42	13.6

Table 2 shows the gender distributions of of 309 respondents collected from data collection. Table 2 shows that female respondents made up 68.9 percent (n=212) of the total, while male respondents made up 31.4 percent (n=97). Because university students are more feminine than males, female respondents outnumber male respondents. The total number of responders by age was shown. Ranging in age from 17 to 19, 20 to 22, and 23 to 25 years old. According to the table, the age group with the biggest number of respondents is 23-25 years old, with 179 respondents and 57 percent. Second, responders aged 20-22 made up 111 people, accounting for 35.9 percent of the total. Finally, the lowest age group of respondents was 17-19 years old, with 19 respondents and a value of 6.1 percent.

Other than that, based on the table shows the total respondents by the program at University Malaysia Kelantan (UMK) in Faculty Hospitality, Tourism and Wellness (FHPK). According to the table, Hospitality received the most responses, with 123 people responding for 39.8 percent. Tourism came in second with 112 respondents and a 36.2 percent response rate. Then came Wellness, which had 74 responses and a value of 23.9 percent.

For the years, the table above clearly reveals that year 3 respondents accounted for the biggest number of respondents, with 178 totalling 57.6 percent. The second year had 48 responses and a value of 15.5 percent. Meanwhile, the number of respondents in year 4 is 42, with a value of 13.6 percent. Year 1 had the lowest number of respondents, with 41 people responding for a value of 13.3 percent.

Result of Descriptive Analysis

Table 3: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Information quality	I agree the information provided by UMK e-learning system is useful.	4.28	0.705
	I agree the information provided by UMK e-learning system is understandable.	4.29	0.738
	I agree the information provided by UMK e-learning system is interesting.	4.25	0.784
	I agree that the information at my university online course website is relevant.	4.27	0.745
	I believe the online course website at my university is always willing to help students get information.	4.23	0.824
Technology related and system quality	I believe the e-learning system provided by UMK has an attractive appearance.	4.19	0.843
	I agree that the e-learning system provided by UMK has a stability.	4.17	0.853
	I agree that the e-learning system provided by UMK is easy to access.	4.09	0.847
	I believe the e-learning system provided by UMK is easy to find the content of user needed.	4.18	0.849

	I agree that the e-learning system provided by UMK is up to date.	4.23	0.798
Online interaction	I agree that my instructor responded promptly when students ask questions.	4.33	0.785
	I believe that I contributed to the learning environment by responding to my peers**.**	4.29	0.743
	I agree that my instructor encourages students to ask questions.	4.40	0.717
	I agree my instructor provided me feedback on my work through comments.	4.29	0.742
	I believe that I regularly communicated with my instructor of the course.	4.12	0.840
	I agree that increased contact with fellow students helped me more out of this course.	4.39	0.734
Student's satisfaction	I believe using an online learning service can help me learn more effectively.	4.30	0.758
	I believe online learning in our faculty is better than another faculty.	4.16	0.818
	I am generally satisfied with the online class arrangement.	4.21	0.818
	I am satisfied with the faculty members' alternative assessment plans.	4.23	0.792
	I agree that online learning service have a beneficial for me.	4.33	0.747

Table 3 shows the mean and standard deviation of information quality, which could determine students' satisfaction with e-learning. The respondents agreed (mean= 4.23, standard deviation= 0.824) that students believe the online course website at their university is always willing to help students get information. Meanwhile, the respondents also agreed (mean= 4.29, standard deviation= 0.738) that the information provided by the UMK e-learning system is understandable.

Regarding technology-related and system quality, the respondents agreed (mean= 4.09, standard deviation= 0.847) that the e-learning system provided by UMK is easy to access. While the respondents agreed (mean= 4.23, standard deviation= 0.798) that the e-learning system provided by UMK is up to date.

The lowest mean that respondents agree that they regularly communicated with their instructor of the course (mean= 4.12, standard deviation= 0.840). Meanwhile, the highest mean that the respondents totally agree is that their instructor encourages students to ask questions (mean= 4.40, standard deviation= 0.717). Other than that, online interaction might be the factor influencing student's satisfaction in using e-learning.

After that, as for the student's satisfaction as a dependent variable that influences respondents in using e-learning for hospitality and tourism practical-based courses, the respondents agreed (mean= 4.16, standard deviation= 0.818) that online learning in their faculty is better than other faculty. Meanwhile, the respondents agreed (mean= 4.33, standard deviation= 0.747) that online learning services are beneficial for them.

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis		Correlation Coefficient (r) + Strength	P-value	Result (Supported/Not Supported)
H^1: There is a significant relationship between information quality and students' satisfaction in using e-learning.	Information Quality ▼ Student's Satisfaction	0.749 + High Positive	< 0.01	H_1 is supported
H^2: There is a significant relationship between technology and system quality and students' satisfaction in using e-learning.	System Quality ▼ Student's Satisfaction	0.717 + High Positive	< 0.01	H_2 is supported
H^3: There is a significant relationship between online interaction and student's satisfaction in using e-learning.	Online Interaction ▼ Student's Satisfaction	0.786 + High Positive	< 0.01	H3 is supported

The Pearson correlation coefficient and significant value are shown in Table 4. For each variable, the p-value was less than a significant level of 0.0. 309 respondents who have utilised e-learning for hospitality and tourism practical-based courses found a significant relationship between student satisfaction and information quality. The independent variable is information quality, while the dependent variable is student satisfaction. The correlation coefficient is 0.749, indicating that the dependent variable and the interpretation of information quality have a high positive correlation in Table 4.4.

Meanwhile, the relationship between student satisfaction and technology-related and system quality among 309 respondents who participated in the questionnaire has shown the result correlation of that indicates 0.717 and online interaction shows the result correlation of that indicates 0.786. In that case, the technology-related variable and system quality and online interaction also showed the same result as information quality, where the interpretation of it has a high positive correlation between the student's satisfaction. The index of both values shows information quality and system quality at between 0.70 and 0.90 significant levels.

Therefore, based on the results, all hypothesis is supported and became a factor in students' satisfaction with using e-learning.

DISCUSSION AND RECOMMENDATION

The research study's objective is to examine the relationship between information quality, technology related and system quality and online interaction towards student's satisfaction in using e-learning among student Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan. The data result shows a significant relationship between the independent variables and the dependent variable. Similarly, an earlier study has discovered a link between information quality, system quality, online interaction and student satisfaction. In addition, online interaction has the strongest correlation compared to information quality and system

quality based on the Pearson Correlation values, followed by information quality and system quality represented by the correlation (0.786 > 0.749 > 0.717).

Based on the study's findings, the current study would provide several recommendations for future research to include new variables that have a more significant influence or lead to the student's satisfaction in using e-learning. Future research should aim to broaden the scope of the study to include more fields and levels. Researchers should consider how perceived interaction quality influences output variables such as access, teacher satisfaction, student learning, and cost-effectiveness. It will be fascinating to learn more about how learning process variables affect faculty satisfaction.

Furthermore, students' social skills, such as communication, reasoning, and practical abilities, will be diversified through interactive learning activities during the online learning process. As a result, professors should play a role in offering online learning that includes activities that can improve students' knowledge and excite and develop crucial social skills.

CONCLUSION

In conclusion, this study has discovered the factors influencing students' satisfaction in using e-learning for practical courses in hospitality and tourism. Four independent variables, information quality, technology-related and system quality and online interaction, have been chosen to examine their relationships with the dependent variable, which is the students' satisfaction in using e-learning for hospitality and tourism practical-based courses. A total of 309 respondents aged 17 years old and above were selected from UMK students who majored in tourism, hospitality and wellness practice based courses. Overall, online interaction has the strongest correlation compared to information quality and system quality based on the Pearson Correlation values, followed by information quality and system quality represented by the correlation (0.786 > 0.749 > 0.717).

ABSTRACT

Covid-19 has produced conditions that impact all countries and individuals worldwide, causing society to adjust their political, economic, and social behaviour on an unprecedented scale in the contemporary age. The researchers wanted to research whether the independent variable (destination choice, accommodation hygiene, and group size) and the dependent variable (decision-making) were related. 384 questionnaires were distributed to those travelling during the post-pandemic era. The researcher conducted questionnaires through social media such as WhatsApp, Instagram and Twitter. Descriptive analysis was used to describe the respondent's demographic and to study the relationship between Independent Variables (IV) and Dependent Variable (DV) by using Pearson correlation. A pilot study was used to measuring the reliability of the questionnaire. The researcher conducted a pilot study with 30 respondents before conducting the questionnaire. Data for pilot tests were conducted using Cronbach's Alpha analysis to ensure the internal reliability of the information. This research will also benefit future research to further studies related to this topic.

 Keywords: Destination choice, Accommodation hygiene, Group size, Decision making.

INTRODUCTION

The spread of the Covid-19 pandemic has affected the entire world and, at the same time, forced a change in political, economic and social behaviour in society. This change is a large-scale and unprecedented change in today's modern era. Due to that, some countries are tourist havens feeling the effects of the Covid-19 epidemic. Among them are the U.S.A., United Kingdom, France, Spain, Belgium, South Africa, Norway, Italy and Sweden. Since travel is required for tourism activities, any factors that hinder travel may profoundly impact the tourism industry (Verma et al., 2020). The Covid-19 epidemic has changed many aspects of human life, and business, including tourism management, as almost half of the global population adopts movement restrictions on a large scale (Rahman, Gazi, Bhuiyan, & Rahaman, 2021).

Safety and health measures are a priority when travelling. Safety and health precautions can protect individuals from the threat of disease or danger that can invite harm. Every tourist has risks in terms of health, especially children, pregnant women and the elderly, due to having weakened immunity. Therefore, the Ministry of Tourism, Art and Culture Malaysia (MOTAC) and the Ministry of Malaysia must provide health accreditation programs to the tourism industry covering the aviation, hotel, transportation and shipping operations sectors (Idris, 2020). Through this accreditation, the tourism sector that passes the assessment from the Ministry of Health MOTAC is given a special badge as a health and safety certification. With this assessment, individuals with weak immunizations can travel safely during the post-outbreak.

The destination is the main thing in making vacation planning. Therefore, before planning a vacation, individuals need to make the right destination selection so that the intended destination is safe from Covid-19 infection during the vacation. Tourism destination decision-making has been extensively explored, and many variables have been recognized as explanatory variables of destination choice (Alom et al., 2019). For destination selection, tourists prefer destinations that are not crowded with other tourists to avoid congestion (Rahman, Gazi, Bhuiyan, & Rahaman, 2021). In addition, accommodation hygiene is the

second thing in making holiday planning. This is because the cleanliness of the accommodation is essential during the holiday so that tourists feel comfortable, and safe and do not worry about the epidemic infection. The Covid-19 infection rate is low when the accommodation is clean because of frequent cleaning.

Moreover, tourists will seek safe accommodation with proper social spacing and sanitation as a precaution (Awan, Shamim, & Ahnn, 2020). Once travel decisions have been made, group size is also an essential element during a post-pandemic vacation. Traveling in a small group can prevent the transmission of Covid-19 infection because there are not many at once. Therefore, tourists can keep their distance from other tourists. Traveling in larger groups is prone to infection and complicates the situation when miscommunication and schedule conflicts occur (Su, Cheng, & Huang, 2021). Decision-making also influences tourists to decide to travel.

This study examines the perception of health and safety precautions regarding post-pandemic Malaysia domestic travelling decisions. Decision-making also influences tourists to decide to travel. Tourists do not want to risk of traveling during the post-pandemic because of safety and health concerns. Therefore, industry players in tourism need to adhere to prevention protocols and Standard Operating Procedures (SOPs) and SOP compliance to tourists to curb the spread of Covid-19 infection. There are three objectives in this research:

1. To identify the relationship between destination choice and the post-pandemic Malaysia domestic travelling decision.

2. To examine the relationship between accommodation hygiene and the post-pandemic Malaysia domestic travelling decision.

3. To determine the relationship between group size and the post-pandemic Malaysia domestic travelling decision.

Significance of the Study

Academic

This study focuses on the perception of health and safety precautions regarding post-pandemic Malaysia domestic travelling decisions. The findings from this study can help future researchers in making studies related to taking health and safety measures when travelling during the post-pandemic. The ideas presented or future researchers can use the findings from this study as reference data in conducting new research or in testing the validity of other relevant findings. This study will also be a cross-reference to future researchers who will provide background or an overview of the perception of health and safety precautions for post-pandemic Malaysia domestic travelling decisions. Future researchers may also be interested in this study. It can be a guide for future researchers to gather information, and that information can be a building block to have a more extensive study.

Practical

The findings of this study will benefit the community, namely tourists and the tourism industry, such as travel agencies, hospitality establishments and MOTAC organisations. This is because this study focuses on selecting tourism destinations that prioritize health and safety during the post-pandemic. Therefore, the relevant tourism industry can benefit from this study by prioritizing health and safety measures to the destination choice and accommodation hygiene when travelling the post-pandemic. This is to attract tourists because destinations that prioritize health and safety features are the leading choice of tourists in the post-pandemic to protect themselves from the threat of disease and danger.

LITERATURE REVIEW

Safety and Health

Several countries' regulations and travel restrictions have impacted the perception of tourist tourism during and after a pandemic (Wachyuni & Kusumaningrum, 2020). Whereas travel was once considered a personal option, it is now restricted by government regulations regarding access, promotion, safety, immigration, customs, disease prevention, and even foreign policy (Richter,1999). COVID-19's global pandemic has disrupted not only entire socio-economic institutions but has also presented a threat to globalisation and enterprise global operations.

According to another study, tourists' views of safety and health concerns can influence their perceptions of tourist locations, making them more likely to seek out tourist destinations with the quantity and quality of facilities that correspond to the required health regulations (Wachyuni & Kusumaningrum, 2020). Tourists will indeed conduct a safety and health examination of the tourist attraction. Tourists desire as much information as possible about the destination where they plan to spend their vacation to avoid risk and uncertainty about service quality and safety. Tourists gather information about destinations, modes of transportation, and lodging options, compare prices and services, and see photographs and videos from these locations.

Destination Choice

A tourist destination is where people or groups travel to visit (Rashid, 2013). According to Saito and Strehlau (2018), the individual's location selection is influenced by four factors: internal, external, nature, and travel experience. Apart from that, choosing a tourist destination is indeed a difficult task because there are so many variables to consider while making a decision (Karl, Reintinger, & Schmude, 2015).

Since the COVID-19 crisis, tourism operators have been fighting hard to get tourists back to travel. According to Garci, Juaneda, Raya, and Sastre (2015), there is a link between destination choice and post-pandemic travel decisions. Furthermore, behaviour in determining which tourist destination to visit is always linked to the risk of travel; for now, COVID-19 is considered the biggest travel risk (Garg, 2015). Therefore, the post-pandemic of Covid-19 is expected to significantly impact tourists' perceptions of health risks and may alter travel patterns in the long run (Karl, Muskat, & Ritchie, 2020).

Accommodation Hygiene

Accommodation, according to Ramyar, Zaheer, Halim, and Ghasemi (2020), is an establishment that provides travellers with rooms or a place to stay while on vacation. According to Nutsugbodo (2016), tourist accommodation provides a psychological platform for travellers who are temporarily away from home. The accommodation facility's cleanliness standards and customer health protection are the components that attract travellers to stay during the pandemic.

Besides, Riestyaningrum, Ferdaos, and Bayramov (2020) discovered a significant partial association between hygiene and safety on travel intention due to COVID-19. Therefore, the customers' lodging preferences will impact their overall trip plans (Pappas and Glyptou, 2021). A previous study also discovered that accommodations had a largely favourable impact

on traveller satisfaction, and satisfaction has a strong positive association with the intention to revisit the same accommodation (Abdullah & Lui, 2018; Handriana & Putra, 2019).

Group Size

Group size influences group decision-making in the tourist business. For example, group size influences trip mobility patterns, tourism product choices, and expenditures (Su et al., 2021). According to Su, Cheng, and Huang (2021), group size influences group decision-making in the tourist business, ; for example, trip mobility patterns, tourism product choices, and expenditures are all influenced by group size (Su et al., 2021).

Furthermore, Su, Cheng, and Huang (2021) stated that larger groups frequently experience coordination issues such as miscommunications and scheduling obstacles, as opposed to small groups, which have fewer concerns because travel is more accessible, and it is easier to oversee every movement of the group members. The size of a group can have a favourable impact on the closeness and collaboration amongst members of a travel group, which is significant in tourists' evaluations of tourism experiences (Su et al., 2021).

Decision Making

Decision-making is the process through which an individual, group, or organisation decides what future activities to pursue given a set of objectives and resource constraints (Schoemaker et al.,2014). Internal reasons such as stress and panic, fear of being contaminated, or dread of catching an illness by finding oneself in a crowd, surrounded by countless people whose health status is unknown, are reasons for oneself to avoid travelling (Chebli, Amina & Ben, 2020).

Besides, travelling to less-congested regions, as the results demonstrate, maybe the next trend (Shamshiripour et al., 2020). Then, on the future trip, the tourist will be more concerned about the cleanliness of airports, public spaces, hotels, restaurants, tourist attractions, and everyday requirements, as well as the location's accessibility and quality of care (Allam et al.,2014). Other than that, Metro Online (2021) reported that Malaysians would continue the desire to travel in small groups with family and friends for a more relaxing vacation and to visit rare natural areas.

Research Hypothesis

The literature review highlighted that the independent variables, destination choice, accommodation hygiene and group size, affect the post-pandemic Malaysia domestic traveling decision. Therefore, the study planned to examine the effect level among these variables. Therefore, the hypotheses of this study were represented in the following manner based on the literature discussed:

H₁   There is a significant relationship between destination choice and post-pandemic Malaysia domestic travelling decisions.

H₂   There is a significant partial relationship between accommodation hygiene and post-pandemic Malaysia domestic travelling decision.

H₃   There is a significant relationship between group size and post-pandemic Malaysia domestic travelling decisions.

Research Framework

Figure 1 below shows the research framework used for this study

Figure 1: Research Framework

METHODOLOGY

Research Design

The research design describes the type of study to be conducted and the expected outcome of the project. The main objective of research design is to guarantee that the information obtained throughout the research answers the research questions. The relationship between destination choice, accommodation hygiene, group size as independent variables, and perception of health and safety precautions toward post-pandemic Malaysia domestic travel decision as a dependent variable, is conducted in this study. The researchers use quantitative to study the respondents involved in Malaysian domestic travel decisions during the Covid-19 pandemic. This is because the result is numerical and measurable.

Data Collection

Pilot study was used to measure the reliability of the questionnaire. The researcher conducted a pilot study with 30 respondents before conducting the actual questionnaire. Data for this pilot test were conducted using Cronbach's Alpha analysis to ensure the internal reliability of the information.

An online questionnaire is used to collect data for this study. The research utilizes Google Forms because it is simpler to reach respondents all around Malaysia due to the rapid rise of social media. Furthermore, the fact that the total number of samples is 384 is one reason why the researchers cannot employ other methodologies such as surveys due to the large sample size. Then, the researchers will distribute the complete questionnaire via social media such as WhatsApp and Instagram to reach out to the respondents for this research. The questionnaire is likely to be distributed in 2022. The researchers use the Google Form because it is a free web tool that enables the rapid and easy data capture. Moreover, the researchers can create surveys in minutes with Google Forms to collect information from clients or collaborators about products or services.

Sampling

In this research, the researchers used non-probability sampling. Non-probability sampling is a method of collecting samples based on the researcher's subjective judgement rather than random selection. As a result, the researchers decided to conduct this study using purposive sampling to investigate the phenomenon of post-pandemic Malaysia domestic travel decisions among the study's population. Judgmental, selective, or subjective sampling are all terms used to describe sampling techniques. As a result, for a member of the population to participate in the survey, the researchers have provided some requirements. Only individuals who meet those

criteria can then fill out the questionnaire. Furthermore, by setting certain judgments on public members, the researchers will be able to achieve their research objectives.

Data Analysis

The data analysis used for this research is descriptive, reliability test and Pearson correlation analysis. The researchers used the statistical Package for the Social Sciences (SPSS) application to analyse the data obtained from the questionnaires.

FINDINGS

Result of Reliability Analysis

Table 1 below shows the result of the reliability analysis.

Table 1: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Destination Choice	5	0.883
Accommodation Hygiene	5	0.842
Group Size	5	0.955
Decision Making	5	0.920

According to Table 1, the Cronbach's alpha coefficient for destination choice is 0.883, which indicates well. Cronbach's alpha coefficient for accommodation hygiene is 0.842, indicating good reliability, while the group size is 0.955, indicating excellent reliability. Meanwhile, Cronbach's alpha coefficient for decision-making for the dependent variable is 0.920, which is excellent. Because Cronbach's alpha was more than 0.8, the questionnaire was reliable and the respondent understood each item well.

Result of Frequency Analysis

Table 2 below shows the result of the frequency analysis.

Table 2: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	120	31.3
Female	264	68.8
Age		
Below 21 years old	46	12.0
22 to 31 years old	255	66.4
32 to 41 years old	60	15.6
42 to 50 years old	23	6.0
Race		
Malay	307	79.9
Chinese	52	13.5
Indian	24	6.3
Others	1	0.3
Marital Status		
Single	253	65.9
Married	126	32.8
Others	5	1.3
Income		
Less than RM 2000	345	89.8
RM 2000-RM3999	32	8.3

RM4000-RM5999	6	1.6
RM6000-RM6999	1	0.3
Education Background		
High school	80	20.8
Certificate/ Diploma	116	30.2
Bachelor Degree	176	45.8
Master	6	1.6
Others	6	1.6

This study gathered data from 384 people. Based on Table 2, females accounted for 68.8% (n = 264) of the respondents, while male accounted for 31.3 percent (n = 120). 66.4 percent (n = 255) of those who responded were between the ages of 22 and 31. With 15.6 percent (n = 60) of respondents, those between the ages of 32 and 41 are the second most frequent. Followed by the age below 20 years old with 12 percent (n = 46). At the same time, the lowest number of respondents are from 42 to 50 years old, with 6 percent (n = 23). According to the result for the race, more of the respondents were Malay, with 79.9 percent (n = 307). For marital status, a total of 65.9 percent (n = 258) reported that the respondents were single. At the same time, the remaining total of respondents, 32.8 percent (n = 126), were reported married at the time of the survey. The respondents for others with 1.3 percent (n = 5). The highest income among respondents was below RM2000 with 89.8 percent (n = 345). The lowest income group were RM 6000 to RM 6999 with 3 percent (n = 1). The majority of the respondents were Bachelor's Degree which contained 45.8 percent (n = 176).

Result of Descriptive Analysis

Table 3 below shows the result of the descriptive analysis.

Table 3: Result of Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Destination Choice	I agree that post pandemic Covid-19 will affect my destination choice	4.63	0.71
	My destination choice will be cancelled because of post-pandemic Covid-19.	4.44	0.80
	I agree to travel domestically rather than abroad because of Covid-19.	4.57	0.65
	I agree that travelling domestically is safer in the future.	4.52	0.68
	I think most people prefer to select destination with previous experience of hygiene or health safety	4.58	0.62
Accommodation Hygiene	I require the Covid-19 specific safety or security concerns of the hotels to take care of property during a pandemic.	4.50	0.66
	I need hotel rooms, private areas or public areas that are clean or sanitized.	4.58	0.60
	The automation or contactless service systems attract me for booking post pandemic.	4.48	0.63
	I require the hotel to show the cleaning or sanitizing standard of the hotel through a 360' video view.	4.44	0.68

	I need the safety or security of the hotels is maintained with CCTV surveillance	4.54	0.62	
Group Size	I agree that group size effects to tourist's movement patterns while travelling.	4.51	0.65	
	I think most people travel with family members and close friends when considering group travel.	4.49	0.63	
	I believe the risk for Covid-19 infection is greater when travelling in a larger group compared to travelling in a small group.	4.57	0.67	
	I agree the group travel choices are determined by activity, cost, travel timing, transportation, safety or travel distance.	4.54	0.66	
	I believe travelling in a small group has a higher value of travel satisfaction compared to travelling in a larger group.	4.55	0.69	
Decision Making	I will avoid travelling in large groups due to the Covid-19 pandemic.	4.63	0.60	
	I will avoid unnecessary interaction with crowds in public spaces.	4.55	0.65	
	I will avoid overpopulated destinations because of Covid-19.	4.54	0.66	
	I will select a destination with no Covid-19 deaths.	4.48	0.69	
	I will avoid travelling in areas that do not emphasize safety or hygiene.	4.57	0.65	

Table 3 shows the data for the mean and standard deviation for each item in each variable. The highest mean of decision-making is 4.63 (std. Deviation= 0.71) for item question 1. Otherwise, the lowest mean, 4.44 (std. Deviation= 0.80), was for item question 2. The highest mean for accommodation hygiene is 4.58 (std. Deviation= 0.60) for question 2. The highest mean for group size is 4.57 (std. Deviation= 0.67) for question 3. The highest mean for dependent variable (decision making) is 4.63 (std. Deviation= 0.60) for question 1.

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Independent Variables	Correlation Coefficient (r)	P-Value	Result (Supported/Not Supported)
H₁: There is a significant relationship between destination choice and post pandemic Malaysia domestic traveling decision.	Destination choice▼ Decision making	0.736 (High positive correlation)	<0.01	H₁ is supported

H$_2$: There is a significant partial relationship between accommodation hygiene and post pandemic Malaysia domestic traveling decision	Accommodation hygiene▼ Decision making	0.740 (High positive correlation)	<0.01	H$_2$ is supported
H$_3$: There is a significant relationship between group size and post pandemic Malaysia domestic traveling decision.	Group size ▼ Decision making	0.736 (High positive correlation)	<0.01	H$_3$ is supported

Based on Table 4, the p-value for each independent variable is less than the significant level of 0.01. As a result, the independent variables (destination choice, accommodation hygiene, and group size) and the dependent variable (post-pandemic Malaysia domestic travelling decision) have a relationship. All independent variables have a high positive correlation, and all the hypotheses are supported.

DISCUSSION AND RECOMMENDATION

The discussion aims to resolve the questions and address the hypotheses as stated in the first chapter of this study. This study has extensively examined the perception of health and safety precautions regarding post-pandemic Malaysia domestic travelling decisions. Based on the findings of this study, the current study will provide some suggestions for future researchers further to expand the scope of this study to international tourists. Apart from that, some suggestions are also given to industry players to provide the best service to tourists.

The recommendation of this study is to conduct more research on the perception of health and safety precautions towards post-pandemic because this study only focused on the decision to travel domestically during the post-pandemic. The second recommendation of this study is that future researchers will not only focus on the field of hospitality alone. This study researcher discussed only the perception of safety and health precautions towards post-pandemic Malaysia domestic travelling decisions in the hospitality field. The third recommendation of this study is that future researchers may need to expand the scope of the study for international tourists to see their perception of travelling in post-pandemic Malaysia.

The other recommendations are through industry players on the perception of health and safety precautions towards post-pandemic Malaysia domestic travelling decisions. The study findings show that accommodation hygiene has a greater correlation with travelling decisions compared to other independent variables. Therefore, the tourism industry that provides accommodation services such as hotels, motels, hostels, homestays and others need to provide good Standard Operating Procedure (SOP) to protect tourists' well-being. The other recommendations are industry players need to limit the number of tourists in a place so that tourists believe that the destination is safe from crowded areas. The other recommendations are that industry players need to provide family vacation packages suitable for all ages.

CONCLUSION

In conclusion, this study has been accomplished to discover the perception of health and safety precautions regarding post-pandemic Malaysia domestic travelling decisions. Three independent variables, namely destination choice, accommodation hygiene, and group size, have been chosen to examine their relationship with the dependent variable, which is decision-making for the perception of health and safety precautions towards post-pandemic Malaysia travelling decisions. Overall, based on Pearson correlation analysis, the correlation coefficient,

destination choice and group size have the same value of 0.736. For accommodation hygiene, the correlation coefficient value is 0.740. Therefore, destination choice, accommodation hygiene and group size significantly correlate with the post-pandemic Malaysia domestic travelling decision.

ABSTRACT

This research focuses on the influence of motivation factors on post-pandemic screen tourism. This research examines the relationship between destination image, the actor's character and trend of post-pandemic screen tourism. A quantitative methodology was used to complete this research. Respondents aged 18 to 50 years old and above who engage in post-pandemic screen tourism are the target audience for this study. In screen tourism, the majority of the age groups are involved. The survey received 300 responses, and the findings were collected. Descriptive analysis, reliability test and Pearson correlation were used to analyse all data. The results support all variables. This research contributes to understanding the influence of motivation factors on post-pandemic screen tourism. This research and data can be used as reference material for future research.

Keywords: Post-pandemic screen tourism, Destination image, Character of the actor, Trend

INTRODUCTION

Tourism refers to people who travelled and stayed in places other than their usual surroundings for less than a year for leisure, business, or other reasons (John, 2018). With the flow of time, however, this perception has changed. Travel and tours, transportation, hotel, food and beverage, amusement, souvenirs, and other industries have benefited from the growth of tourism. The tourism industry makes money by selling unforgettable experiences (Kim, 2010). Because tourism businesses prioritise customer satisfaction, safety, and enjoyment, it is a dynamic and competitive industry that requires the ability to consistently reflect current clients' needs and wants (John, 2018).

Rising number of the film-maker in the film and tourism industries are collaborating to promote film production while also profiting from the publicity that results. This study examines the capability of film-induced tourism and how it could be converted into a location promotion strategy based on the theoretical literature on cinema tourism (Juskelyte, 2021). Film tourism is gaining popularity all around the world. As a result, tourists are increasingly visiting locations featured in films unrelated to tourism promotion. (Sahoo et al., 2010).

Everything happened rapidly and had an impact on the tourism business today. A pandemic is a disease that spreads worldwide, and COVID-19, which has been classified as was first found in Wuhan, China, in 2019. (Vasishta et al., 2021). COVID-19 instils fear among the public, leading to a decrease in tourism demand. This is one of the effects of disease spreading and the present lockdown method. As a result of this condition, the client demand rate dropped (Bakar et al., 2020). The COVID-19 outbreak has created significant challenges for the tourism industry.

Technological improvements have a significant impact on tourism growth around the world. One of these promising properties is Instagram. Instagram has received international fame as a platform that may significantly boost goods sales and tourism site visits. Following a pandemic, tourism promotion movies significantly increase visitor visitation (Sinulingga, 2021). Not only that, the moment of engagement in a film in which a well-known actor or actress plays a character role (Bioglio, 2018). Each actor's personalities positively affect travellers who want to visit new destinations or places around the world. The location where a film or television series is made piques tourists' attention in terms of writing, storyline, culture, and heritage (Gjorgievski, 2012). Moreover, as worldwide experts promoting the film business among

people worldwide, viral trends in on-screen tourism, such as social media, played an important role. Beyond a film, viewers' perceptions of a site might be positively or negatively influenced (Jewell & McKinnon, 2008). There were objectives of this research:

      1. To investigate the relationship between destination images on post-pandemic screen tourism.

      2. To investigate the relationship between the character of the actor on post-pandemic screen tourism.

      3. To investigate the relationship between trends in post-pandemic screen tourism.

Significance of the Study

Academic

With this study, the researchers can better understand the influence of motivation factors on post-pandemic screen tourism. Researchers can also see what elements will influence post-pandemic tourist motivation. This research aids academics in determining the impact of incentive variables on post-pandemic movie tourism. Through this study, a clearer picture of the relationships between the destination image, the actor's character, and the tourists' inclination toward post-pandemic screen tourism may be shown. Furthermore, little research has been done on post-pandemic screen tourism. This research could address a need in post-pandemic screen tourism research, particularly the presence of tourists and studies on screening tourism.

Practical

This research aims to uncover the aspects that motivational factors may influence in post-pandemic screen tourism. The cognitive component is concerned with thoughts and information about the physical location, whereas the emotional construct is concerned with the affective quality of feelings about the rates and their surroundings. This study could help researchers figure out why people visit areas they've seen on TV or in movies. Furthermore, this study will emphasize destination visuals in advertising a location, particularly to important essential authorities such as tour operators. This research could also provide them with further knowledge about the impact of motivating variables on post-pandemic screen tourism.

LITERATURE REVIEW

Destination Image

The image is a critical component in the advertising of tourism destinations since what makes one destination different from another is critical to its success (Carballo et al., 2015). A destination image is a collection of people's perceptions and interpretations about a specific region, country, or destination (Juskelyte, 2016). Heritage, architecture, recreation, and attributes contribute to the destination image, which might encourage tourists to visit. The image of a destination is vital in affecting tourists' behavioural intentions and choices.

      According to Huete et al., (2019), enhanced international tourism in previous decades and increased competition among destinations have prompted interest in building, monitoring, and presenting a significant destination image. Furthermore, tourism industries demand the development of a particular destination image for each destination to stay ahead of the competition (Im et al., 2011). Moreover, establishing a distinct destination image has become critical for striking out in today's competitive global market. According to tourism studies, a destination's image significantly impacts tourist motivation (Carballo et al., 2015).

Character of the Actors

People currently would like to travel based on the characteristics that attract to them when viewing dramas and films. Every character in the movie will affect the audience since they will equally encourage and make the audience feel as if they are in the film (Nistoreanu & Tucle, 2011). Interactions with celebrities enhance people's perceptions of tourism destinations

(destination image, popularity, and visitation intention). A celebrity's involvement positively affected familiarity and willingness to visit (Lee et al., 2008).

The COVID-19 infection turned out to be a pandemic with impacts on producers and consumers on a large scale. Many celebrities suffer stress and despair when a pandemic like COVID-19 hits, however, they refuse to talk about it. They are ashamed of their feelings and reflect a terrible self-image, which causes them to suffer much more (Preeti, 2019). Celebrities lack the potential to promote post-pandemic film tourism as artists. That really signifies that actors cannot depend just on one medium, such as a movie. Actors can promote screen tourism in various ways, including via social media marketing, marketing and sales relating to tourism films, and so on. COVID-19 is transforming the world. Production films and actors should get a better understanding of client requirements; this is advised. In the current situation, it is suggested that the tourism and film industries generate digital content and communicate with clients (Abena et al., 2020).

Trend

People use social media platforms to market and promote their enterprises, educational institutions, sporting, arts, tourism sector, and other personal interests, making the viral phenomenon one of the world's unpaid commercials. A growing trend, especially among millennia's, who, inspired by movies and television series, take advantage of the opportunity to visit filmmaking locations and spend time with nature and open spaces. This term has evolved to describe how ideas, information, and travel spread throughout a human group (Tony et al., 2012).

According to Alom et al., (2019), film and tourism were philosophically and historically intertwined throughout the post-industrial era. Literature, music, and poetry were formerly essential parts of how information was communicatedcommunicating information (Beeton, 2016). Only a restricted local group of individuals had access to printed materials prior tobefore the creation of cinema and television (Beeton, 2016). Screen tourism is always evolving, adopting new tactics, dismissing antiquated fads, and resurrecting older ones.

Post-pandemic Screen Tourism

In this study, the phrase screen tourism is used to refer to tourism generated by television series, videos, DVDs, and films, which includes both small and large screen productions (but not TV programmes designed primarily to promote tourist destinations, such as holiday shows). The researcher believes that the term screen tourism Evans (2008) undervalues the role of television in driving tourism and that screen tourism is a better approach to describe the phenomena.

Beeton (2009) points out, that screen tourism is better defined as a journey that lasts a long time, especially in the case of broadcast drama. Indeed, while film (particularly film rather than television) tourism activity peaks shortly after a film's release, the enduring features of some film and television productions often draw visitors for years after their release (Riley et al. 2010) or the conclusion of a TV series.

Research Hypothesis

The hypotheses in the study are the statement about the possible relationship between independent variables and dependent variables based on observation. Therefore, the hypotheses for this study are:

H₁   There is a significant relationship between the destination image and post-pandemic screen tourism.

H₂   There is a significant relationship between the character of the actor and post-pandemic screen tourism.

H₃   There is a significant relationship between the trend and post-pandemic screen tourism.

Research Framework

Figure 1 below shows the research framework used for this study

Figure 1: Research Framework

METHODOLGY

Research Design

The method adopted for this study was one of many procedures utilized by many tourism researchers to analyse the study. This study used the quantitative method where online questionnaires were distributed to 300 respondents from Malaysia that tend to travel. In this research, the target populations chosen were Malaysian citizens who tend to travel after watching on-screen films. The research design also specifies the sort of study that will be conducted and the intended outcome of the project. The primary goal of research design is to guarantee that the data acquired throughout the study answer the research questions. The link between the destination image, the character of the actors, the trend as independent variables, and post-pandemic screen tourism as a dependent variable, is investigated in this study.

Moreover, a set of online questionnaires was distributed to the population to collect the data: individuals tend to travel after watching on-screen media. This questionnaire used the format of multiple choices and 5-point Likert scales of agreement. The researcher divided questionnaire into 5 parts which arethe questionnaire into 5 parts: Part A, B, C, D and E. For Section A, the questionnaire requested for the general information about the respondents' demographics, such as the gender, age, race, education level, socioeconomic status and marital status. For Sections B, C, D and E, the questions elaborated more on the independent variables and dependent which were (IV1) Destination Image, (IV2) The Character of the Actor, (IV3) Trend and (DV) Post-Pandemic Screen Tourism that were examined in the survey.

Data Collection

The data collection was conducted using questionnaires. The surveys were distributed using the Google Forms application in this study. The questionnaire was distributed via the internet, social media, and to possible respondents on Facebook, including My Malaysia Travel Group and Kaki Travel Malaysia, and data was collected from Malaysians. The main benefit of online surveys for researchers is that they increase productivity by reducing effort.

Sampling

Because the majority of people nowadays have seen movies and films, researchers have a variety of options for selecting respondents for their studies. The researchers used a non-

probability heterogeneous purposive sampling method in this investigation. Purposive sampling was used for this study because it offers several advantages, including the ability to pick a small sample size, reduce bias, and gather data in a realistic mannerrealistically gather data.

Data Analysis

This study used three methods for data analysis: descriptive analysis, reliability testing, and Pearson correlation analysis. SPSS version 27 was used to analyse the collected data. To make it easier for respondents to answer the questions, they are divided into three sections, each bilingual (English and Malay).

FINDINGS

Result of Reliability Analysis

Table 1: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Destination Image	5	0.793
The Character of The Actor	5	0.881
Trend	5	0.871
Post-Pandemic Screen Tourism	5	0.853

The Cronbach's Alpha values for the questionnaire were in the range of good (0.7-0.8) to very good (0.8-0.9) in table 4.2.1. The first independent variable, destination image, was determined to be good and dependable regarding the degree of correlation (5 items: a = 0.7). The second independent variable, the character of the actor, was determined to be very good and dependable in terms of the degree of correlation (5 items: a = 0.8), as were the trend variables. The dependent variable, post-pandemic screen tourism, was determined to be very good and trustworthy in terms of correlation strength (5 items: a = 0.8). The overall variables result on Cronbach's Alpha is at a good level. Therefore, the data that were considered can be used for future research.

Result of Frequency Analysis

The distribution of the respondents in terms of their background characteristics was analysed using descriptive statistics involving frequency and percentage. Table 2 shows the result of the frequency analysis:

Table 2: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	132	44.1
Female	167	55.9
Age		
18 to 25	191	63.7
26 to 39	60	20.0
40 to 59	28	9.3
60 and above	21	7.0
Race		
Malay	185	61.7
Chinese	56	18.7
Indian	36	12.0
Others	23	7.7
Education level		
SPM	24	8.0
Diploma or STPM or Matriculation	60	20.0
Degree	133	44.3

Postgraduate	46	15.3	
Others	37	12.3	
Socioeconomic status			
Below RM 4,850	189	63.0	
RM 4,851 to RM 10,970	87	29.0	
Exceeds RM 10,971	24	8.0	
Marital status			
Single	200	66.7	
Married	59	19.7	
Divorced	21	7.0	
Others	20	6.7	

Result of frequency analysis is used to explain the demographic profiles in section A of the questionnaire, as well as the frequency and percentage. With this summary, the data gathered can be put into context and turned into usable information, allowing the study to be better understood.

Result of Descriptive Analysis

Table 3: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Destination Image	I agree that the inclusion of a destination images in movies or television films can induce screen-tourism.	4.66	0.647
	I agree that destination images on screen can lead to altered perceptions of a destination.	4.60	0.611
	I can become more familiar with that destination images after watch on-screen films.	4.51	0.719
	I believe that different destination had different perspectives of destination image.	4.56	0.707
	The positive image of destination through pop-culture made me desire to visit the destination for a future trip.	4.56	0.674
Character of the Actor	I believe that celebrity involvement will have intentions me to visit destinations that celebrities signify.	4.29	0.940
	The actor's characteristics in a particular film will affect my attitude or behaviour as a fan.	4.18	0.902
	I believe that celebrity involvement plays an important role in enhancing the value perceptions of me as a fan or traveller.	4.20	0.907
	I believed that the character of the actor has the power to influence my perception through the familiarity of destination or intention visitation.	4.19	0.944
	I feel very close to my idols when I visit the idol-related places.	4.03	1.087
Trend	I agree that I can make travel decisions through the influence of social media.	4.35	0.834

	I agree social media is a trend that most people use during the post-trip stages to reflect on and share travel experiences.	4.39	0.761
	I believe social media is a popular trend and platform when travellers are looking for a destination to visit.	4.40	0.759
	I agree that exploring social media for attractions before and during travel is again one of the frequent trends that travellers do.	4.39	0.795
	I believe the use of social media has become a habit in people's daily lives.	4.46	0.750
Post-Pandemic Screen Tourism	I agree by seeing a screen tourism destination in a TV series makes me interested in this destination.	4.48	0.724
	I agree when I am watching a TV series, I pay attention to the place where it was filmed.	4.33	0.831
	I agree that when I watch a season of a TV series, I become interested in elements related to it, or sometimes search for additional information in order to further connect with the series.	4.31	0.842
	I constantly compare images or icons I have in my mind from watching the TV series with the reality of the filming location.	4.38	0.819
	I agree that the existence of other tourism products or attractions such as seaside tourism, nature tourism, food tourism in some destinations that are attracting tourists to come to the screen tourism spot.	4.55	0.670

Table 3 shows the mean and standard deviation for the items used to measure the destination image. Five questions were measured with the highest mean of (mean= 4.66, standard deviation= 0.647) for the statement "I agree that the inclusion of a destination image in movies or television films can induce screen-tourism.". Otherwise, the lowest mean (mean= 4.51, standard deviation= 0.719) was for the statement, "I can become more familiar with that destination images after watching on-screen films.". The mean values for the other three statements are "I agree that destination images on the screen can lead to altered perceptions of a destination" (mean= 4.60, standard deviation= 0.611). At the same time, "I believe that different destinations had different perspectives of destination image" (mean= 4.56, standard deviation= 0.707 and lastly "The positive image of destination through pop-culture made me desire to visit the destination for a future trip" (mean= 4.56, standard deviation= 0.674) respectively.

Table 3 presents the mean and standard deviation for the items used to measure the character of the actors. Five (5) questions were measured with the highest mean of (mean= 4.29, standard deviation= 0.940) for the statement 'I believe that celebrity involvement will have intentions me to visit destinations that celebrity signify'. Besides the second highest mean of (mean= 4.20, standard deviation= 0.907) for the statement 'I believe that celebrity involvement plays an important role in enhancing my value perceptions as a fan or traveller'. The moderate mean value was (mean= 4.19, standard deviation= 0.944) and (mean= 4.18,

standard deviation= 0.902) on the statement 'I believed that the character of the actor has the power to influence my perception through the familiarity of destination or intention visitation' and 'The actor's characteristics in a particular film will affect my attitude or behaviour as a fan. The lowest mean of (mean= 4.03, standard deviation= 1.087) for the statement 'I feel very close to my idols when I visit the idol-related places'.

Table 3 shows the mean and standard deviation for the items used to measure the trend of standard deviation. There were five (5) questions measured with the highest mean of (mean= 4.46, standard deviation= 0.750) for the statement "I believe the use of social media has become a habit in people's daily lives". Besides the second highest mean (mean= 4.40, standard deviation= 0.759) for the statement "I believe social media is a popular trend and platform when travellers are looking for a destination to visit". The moderate mean value was (mean= 4.39, standard deviation= 0.761) on the statement "I agree social media is a trend that most people use during the post-trip stages to reflect on and share travel experiences" and "I agree that exploring social media for attractions before and during travel is again one of the frequent trends that travellers do" (mean= 4.39, standard deviation= 0.795). The lowest mean (mean= 4.35, standard deviation= 0.834) for the statement "I agree that I can make travel decisions through the influence of social media".

Table 3 describes the mean and standard deviation for the items used to measure the post-pandemic screen tourism of standard deviation. There were five (5) questions measured with the highest mean of (mean= 4.55, standard deviation= 0.670) for the statement 'I agree that the existence of other tourism products or attractions such as seaside tourism, nature tourism, food tourism in some destinations that are attracting tourists to come to the screen tourism spot'. Besides, the second highest mean (mean= 4.48, standard deviation= 0.724) for the statement 'I agree by seeing a screen tourism destination in a TV series makes me interested in this destination. The mean value of (mean= 4.38, standard deviation= 0.819) on the statement 'I constantly compare images or icons I have in my mind from watching the TV series with the reality of the filming location'. The second lowest mean (mean= 4.33, standard deviation= 0.831) for the statement 'I agree when I am watching a TV series, I pay attention to the place where it was filmed. The mean value for the statement "I agree that when I watch a season of a TV series, I become interested in elements related to it, or sometimes search for additional information to further connect with the series" (mean= 4.31, standard deviation= 0.842) presented as the lowest mean, respectively.

Result of Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Significant (p value)	Result (Supported/Not Supported)
H₁: There is a significant relationship between the destination image and post-pandemic screen tourism.	r= 0.592, p<0.01	H₁ is supported
H₂: There is a significant relationship between the character of the actor and post-pandemic screen tourism	r=0.591, p<0.01	H₂ is supported
H₃: There is a significant relationship between the trend and post-pandemic screen tourism.	r= 0.641, p<0.01	H₃ is supported

Based on Table 4, Pearson's correlation analysis was used to test the relationship between hypothesis on a sign which is destination image, the character of actor, and trend with the

relationship between post-pandemic screen tourism. The result shows all the hypothesis started were accepted at a 0.01 significance level.

DISCUSSION AND RECOMMENDATION

The research study's objective is to examine the relationship between destination image, character of the actor, and trend towards post-pandemic screen tourism. The data result shows a significant relationship between the independent variables and the dependent variable. Similarly, earlier study has discovered a link between destination image, actor character, trend, and post-pandemic screen tourism. In addition, trend has the strongest relationships compared to the destination image and the actor's character. Independent variables of correlation were represented (0.614> 0.534> 0.461).

The current study makes various recommendations for future research, including new variables that are critical determinants that play an essential part in evaluating the influence of motivating factors on post-pandemic screen tourism that the researchers have omitted. Qualitative methods will be required to obtain data from respondents in the future. If qualitative data collection methods are used, future researchers will acquire relevant, reliable, and able results to communicate bilaterally with respondents. In addition, the questionnaire should be distributed to groups that have participated in screen tourism. Future researchers who seek to examine screen tourism in Malaysia will be aided by having more accurate, reliable data and the support of more respondents. As a result, destination marketers, travel companies, and celebrities play a critical role in ensuring that Malaysian screen tourism reaches many tourists.

CONCLUSION

In conclusion, the research on the influence of motivation factors towards post-pandemic screen tourism has been finalised and analysed. In this research, based on an examination of a total of 300 respondents, which are from 18 years old and 60 years old, the research objectives have been achieved, research questions were answered, and a hypothesis is supported.

Overall, hypothesis independent and dependent variables revealed the positively related relationship. The association between the destination image, the character of the actor, and the trend on the influence of motivation factors is strongly indicated as moderate to very good. Furthermore, according to the Pearson Correlation values table, the actor's character scored a value of 0.881, followed by trend with value 0.871, destination image with value 0.793 and decision to go for post-pandemic screen tourism with value 0.853. This research and data can be used as reference material for future research.

ABSTRACT

This research focuses on the factors of satisfaction in mobile food delivery applications among generation Z in Malaysia. This research examines the relationship between promotion and discount, perceived price, convenience motivation and food quality in satisfaction mobile food delivery applications. A quantitative methodology was used to complete this research. Respondents aged 10 to 27 years old and above who engage in generation z are the target audience for this study. Generation z, the majority of the age group are, involved in this research. The survey received 361 responses, and the findings were collected. Descriptive analysis, reliability test and pearson correlation were used to analyse all data. The results support all variables. This research contributes to understanding the factors of satisfaction in mobile food delivery applications among Generation Z in Malaysia. This research and data can be used as reference material for future research.

Keywords: Promotion and Discount, Perceived Price, Convenience Motivation, Food Quality, Consumer Satisfaction

INTRODUCTION

In today's world, the widespread adoption of the internet has resulted in many online business platforms for services and products. With programmes built to perform certain identical services from computing devices, mobile applications have risen significantly in the digital media business. One of its focus areas is services in online mobile food delivery applications (Wang et al., 2019). Lau and Ng (2018), there is room for growth in the Southeast Asian internet meal delivery market, particularly in Malaysia. However, the COVID-19 outbreak that struck Malaysia in early 2020 boosted demand for using mobile food application services within the country. Das (2017) revealed that customers choose electronic food ordering because of the accuracy of the order. This is because the COVID-19 outbreak has impacted everyone's daily lives, prompting the Malaysian government to enact measures such as the Movement Control Order (MCO) across the country to address the disease. The epidemic has also resulted in a new food and beverage consumption trend among Malaysians. To stay safe, many use mobile food delivery application service to order food. As a result of this phenomenon, many food and beverage companies have decided to go online. During this era of digitalisation, people have moved from the standard ordering method to online ordering because it is easy, error-free, quick, and completely transparent (Alom et al., 2019).

Therefore, because many people use mobile food delivery applications to order food, the number of mobile food applications has expanded. Foodpanda, GrabFood, Food Ninja, and other applications were used. Foodpanda and GrabFood are the most widely used applications among all of these (Müller, 2021). During the COVID-19 pandemic, when all Malaysians were required to maintain social distance and adhere to Standard Operating Procedures (SOPs), these mobile food delivery applications got a lot of attention and increased more than ever. As a result, people use the available resources to place meal orders using these applications. The internet mobile food delivery applications market has become quite competitive. Customer satisfaction is a critical factor in marketing that plays a part in acquiring a competitive advantage because it has a significant impact on retaining former customers and attracting new ones).

Positive experiences can positively impact the online food and beverage industry. The use of this application takes only a few seconds to download, and the process of ordering as well as purchasing only takes a few minutes. Gupta (2019) argue that food applications nowadays are the only way to order from various restaurants, as this has also started to change customers' mindsets. The online food ordering system will provide an online food menu with the support of an innovative mobile food application and deliver the expected food items to the consumer's entrance. Customers can place food orders via smartphones, which is a key benefit of online mobile food applications. Customers will find ordering food through mobile food delivery applications to be faster, easier and more convenient. Consumer preferences have also changed as technology has driven them to buy everything online, including getting raw materials, cooked food and other items delivered to their homes (Kwong, 2017).

This study aimed to provide an overview of the satisfaction with mobile food delivery applications among Generation Z in Malaysia. This study's findings are important as mobile food delivery applications are growing in Malaysia. However, this study emphasizes the determinants that influence the satisfaction of customers using this application. There are four objectives of this research:

1. To identify the relationship between promotion, discount, and satisfaction in mobile food delivery applications among Generation Z in Malaysia.

2. To identify the relationship between perceived price and satisfaction in mobile food delivery applications among Generation Z in Malaysia.

3. To identify the relationship between convenience motivation and satisfaction in mobile food delivery applications among Generation Z in Malaysia

4. To identify the relationship between food quality and satisfaction in mobile food delivery applications among Generation Z in Malaysia.

Significance of the Study

Researcher

The research finding will provide benefits and advantages for anyone who wants to examine the mobile food delivery application in more depth because there is already a finding from the previous study on mobile food delivery application that can make new researchers gain a lot of knowledge about mobile food delivery application. Thus, this study can be used as a basis of information and be a factor that affects the continuity of mobile food delivery applications in Malaysia.

Industry

This research proposal provides wisdom into the digital industry (mobile food delivery applications) on its use among generation z. Operators and marketers will want to adjust to customer's aims and fulfil customer needs; the industry can accomplish upper hand through better dynamics which helps the industry in acquiring higher benefits.

LITERATURE REVIEW

Mobile Food Delivery Applications

The internet has given a window of opportunity for individuals worldwide to contact one other without regard to time or geography, allowing anyone to conduct viable and direct commercial opportunities through a virtual platform (Kian et al., 2018. Smart technology and mobile application software have become an integral part of our daily lives and a critical channel for organisations seeking to improve consumer interactions. A food delivery application is an online platform where customers can order meals to be delivered to them at their preferred time and location. Besides, according to Moriarty (2018), food delivery applications have steadily changed the food and beverage business, owing to the expanding potential of delivery services to assure employee efficiency, delivery order accuracy, and client database generation. In Malaysia, Foodpanda is the first food delivery company established in Malaysia. Based on Mainuddin (2018), Foodpanda has partnered with over 45,000 restaurants worldwide and continues to expand quickly, because it operates on an online-to-offline business strategy and has a platform service supply chain.

Consumer Satisfaction

Many researchers have looked inside the importance of consumer satisfaction. According to Kotler (2000) reported consumers, consumer satisfaction is a state of mind that results from a customer's comparison on their expectation before a purchase and performance perceptions after. According to this definition, if a customercustomers' mobile food ordering application usage experience surpasses the assumptions, they are more likely to be satisfied and motivated to use the application more. Satisfaction as "someone feeling happy or disappointed as the result of comparing a product perceived achievement or result in a relationship according to his expectations". Homburg & Giering (2001) said that consumer satisfaction exists and poses an important problem in marketing because happy consumers can change to reliable consumers who guarantee the seller's profit. This is very important for most businesses. Besides, satisfaction assesses the number of service providers that can meet or exceed customer expectations (Levy & Weitz, 2007). Customer satisfaction has a positive effect on the profitability of an organization. Therefore, customer satisfaction is the foundation of a successful business since it leads to repeat purchases, customer loyalty, and positive word of mouth (Hoyer & MacInnis, 2001).

Promotion and Discount

Promotions and discounts are creating communication tools that want to stimulate results. The attractiveness of promotions and discounts can temporarily affect consumer purchasing decisions (Shaddy & Lee, 2020). Besides, it is a plan to increase sales of a product or service in the short term, which it helps stimulate as well as encourage customers to decide to buy a product or service in the market Pi & Huang (2011) research found that promotion can maintain customer loyalty by improving consumer satisfaction, trust and commitment (Clow et al., 2010). Promotion is a type of marketing communication that involves sharing information, influencing, and enhancing the target market of organisations and products so that they will accept, buy, and be loyal to the items given by linked businesses. Besides, a discount is a reduction in the regular price of a product or service to obtain or increase those sales. Mujiyana& Ingge Elissa (2013) mentioned this online purchase is in demand because it is very convenient, time-saving and cost-effective when compared to shopping outside.

Perceived Price

Al-msallam (2015) indicated that price is an essential factor in generating consumer satisfaction because customers always evaluate the value of services based on their prices Price has been considered a significant component in explaining consumer behaviour. According to Kotler & Armstrong (2010), Price is the amount of money demanded in exchange for receiving a good or service and the sum of the values that customers exchange for the benefits of possessing the goods or services. Jeneefa & Rajalakshmy's (2020) research shows customers like online ordering because it gives them more control and convenience, which leads to increased satisfaction. However, Korda & Snoj (2007) state this concept of price is fundamental because many other elements might influence a customer's real perception of what is sacrificed. Therefore, Martin-Consuegra et al. (2003) state that perceived is directly affected by consumer satisfaction with judgement. Customers do not always recall or know the exact price of a product, instead, they subjectively encode pricing as "expensive" or "cheap." As a result, it implies that a customer's price impression may differ from the objective price (Zeithaml, 1998).

Convenience Motivation

Motivation is the term used to describe the motivations for voluntary and intentional behaviour. Motivation results from a complex web of ideas, perceptions, values, interests, and behaviours (Emily. R, 2011). Radon (2015) stated convenience motivation is a lifestyle, and business models have been influenced by the digital age. Convenience items were created to save consumers time and energy while purchasing and owning them. A comprehensive assessment of the literature on consumer convenience in the service economy defines service convenience as customers' views of the time and effort associated with purchasing or utilising a service (J. Mark. 2002). Customers can easily place orders over the phone. People prefer to employ technology supplied by the country because it saves time, simplifies tasks, and allows them to accomplish something quickly.

Food Quality

Food quality is a vital component of a customer's eating experience because it refers to a restaurant's overall success in meeting customer needs (Sulek et al., 2004). Menu, presentation, size, and variety were utilised as indices of meal quality by (Liu et al., 2017). As we all know, food quality is at the core of meeting the needs of restaurant customers, which can achieve loyal customers and repeat purchases (Rozekhi, Hussin, Siddiqe, Rashid, & Salmi, 2016; Kannan (2019) also found that food quality fundamentally affects consumer satisfaction and behavioural intentions.). According to Sulek & Hensley (2004), attractiveness, safety, and nutritional factors are characteristics commonly used by consumers to determine food quality. The exceptions analysing the effect of food quality on consumer experience and services supplied through online meal delivery using the criteria flavour, nutrition, and diversity (Ha & Jang 2010). Liu & colleagues (2017) confirmed that food quality factors primarily determine customers restaurant choices. That food quality is a crucial determinant of customer satisfaction. Besides that, food quality focuses on the relationship between quality, safety, and traceability, as traceability can influence customer views of both food safety and quality food (European General Food Law EC Directive, 2002).

Research Hypothesis

The literature review highlighted that the independent variables like promotion and discount, perceived price, convenience motivation and food quality caused satisfaction in mobile food delivery among generation z in Malaysia. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1   There is a significant relationship between promotion and discount and satisfaction in mobile food delivery applications among Generation Z in Malaysia.

H2   There is a significant relationship between perceived price and satisfaction in mobile food delivery applications among Generation Z in Malaysia.

H₃   There is a significant relationship between convenience motivation and satisfaction in mobile food delivery applications among Generation Z in Malaysia.

H₄   There is a significant relationship between food quality and satisfaction in mobile food delivery applications among Generation Z in Malaysia.

Research Framework

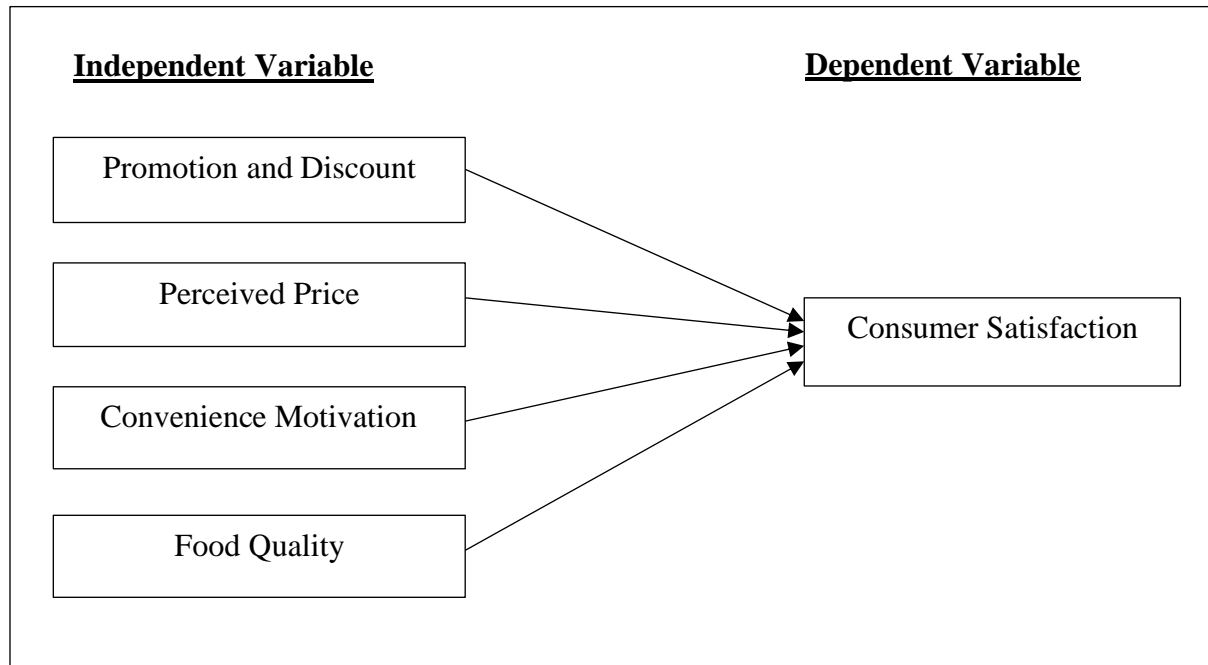
The following conceptual model describes the relationship between promotion and discount, perceived price, convenience motivation and food quality and satisfaction in mobile food delivery applications among Generation Z in Malaysia.


Figure 15:Research Framework

METHODOLOGY

Research Design

This research used a quantitative approach because it allows the researcher to confirm ideas by testing assumptions that have already been formed. On the other hand, quantitative research is the approach used in this study to obtain data and analyse the research). Furthermore, the quantitative research method used data from closed-ended questions to explore connections between variables C and D, the questions elaborated more on the dependent, and independent variables, which were (i) Promotion and Discount, (ii) Perceived Price, (iii) Convenience Motivation and (iv) Food Quality that were examined in the survey.

Moreover, a set of Questionnaires was distributed to the population to collect the data, which are generation z using mobile food delivery applications in Malaysia. This questionnaire used the format of multiple choices and 5-point Likert scales of agreement. The researcher divided questionnaire into 5 sections which arethe questionnaire into 5 sections: Section A, B, C, D and E. For Section A, the questionnaire requested for the general information about the Malaysian generation z demographics such as age, gender, marital status, education level and race of demographic information. For Sections B, C, D and E, the questions elaborated more on the dependent and independent variables, which were (i) Promotion and Discount, (ii) Perceived Motivation, (iii) Convenience Motivation and (iv) Food Quality that were was examined in the survey.

Data Collection

The data collection was conducted using questionnaires. This study chose to distribute the questionnaires using the Google form application. The link to the Google form was distributed to all consumer satisfaction in mobile food delivery applications among generation z on social

media such as Instagram, WhatsApp and others. It was very convenient to minimize cost and save time and significantly applicable during this pandemic outbreak.

Sampling

The sampling method used in this study was non-probability sampling which was convenience sampling. The study used this method because questionnaires were prepared and distributed online or posted on social media pages to gather information from the respondents. The questionnaire was distributed to the respondents who are among the generation z in Malaysia when using mobile food delivery applications through online and social media.

Data Analysis

Four types of data analysis were used in this study: frequency analysis, descriptive analysis, reliability analysis and Pearson Correlation analysis. The data obtained was analysed by using SPSS version 2.5.

FINDINGS

Result of Frequency Analysis

Table 58:Frequency Analysis

Variable	Categories	Frequency n=361	Percentage (%)
Gender	Male	90	24.9
	Female	271	75.1
Age	10-15	9	2.5
	16-20	50	13.9
	21-25	257	71.2
	26-27	45	12.5
Race	Malay	333	92.2
	Chinese	11	3.0
	Indian	8	2.2
	Others	9	2.5
Marital Status	Single	308	85.3
	Married	53	14.7
Education Level	School	46	12.7
	Diploma	63	17.5
	Degree	228	63.2
	Master	11	3.0
	Others	13	3.6

Table 1 shows the age of 361 respondents. Age is divided into 4 categories. There were 9 (2.5 %) respondents aged 10-15 years old. Next, the respondents are in the age range of 16-20 years old, 50 (13.9%) respondents. In contrast, the majorities respondent is 21-25 years old, 257(71.2 %). And last category for age is 26 – 27 years old 45 (12.5%). Next the race of the respondent. The categories is, Malay respondent 333 and (92.2%) for Chinese 11 respondent

(3.0%). The next categories are Indian 8 respondents (2.2%) and last also for other categories 9 and (2.5%). Overall, this survey is also accompanied by the question of marital status, for this marital status is also divided into two only, namely single and married. For singles, 308 (85.3%) and 53 (14.7%) married. Besides that, education is also divided into five categories, and the first is schools have 46 respondents (12.7%). Next is the diploma, have 63 respondents (17.5%) and also for degree category have 228 respondent (63.2%) the master categories have 11 respondent (3.0%), and the last other categories have 13 respondent (3.6%).

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Promotion and Discount	I feel that discount provided encourages me to use mobile food delivery application services.	3.94	0.963
	Terms and conditions of promotion are important to me before I use mobile food delivery application services.	4.00	0.920
	I think that promotion expiry date influences me in making an order.	3.88	1.027
Perceived Price	I think delivery price of mobile food delivery application services is reasonable	3.48	1.046
	I think that tax price in using mobile food delivery application services is reasonable.	3.34	1.135
	I feel that mobile food delivery application services overall price is affordable.	3.49	1.038
	At the current price, mobile food delivery order apps provide a good value.	3.60	1.017
Convenience Motivation	I would find doing online shopping and web-based online transactions on mobile food delivery application services web pages easy	3.80	0.926
	I would find interaction through mobile food delivery application services web pages clear and understandable.	3.83	0.914
	I would find it easy to become skillful at navigating through mobile food delivery application services web pages.	3.79	0.915
	Overall, in using mobile food delivery application services, online shopping or transaction would be easy for me.	3.97	0.909
Food Quality	The food smells good.	3.91	0.801
	The food is delicious.	3.95	0.799
	The food is fresh.	3.78	0.849
	The food looks attractive to me.	3.96	0.832
Consumer Satisfaction	I am overall satisfied with the delivery applications I am currently using	3.93	0.797

	I am satisfied with the food or service ordered through the delivery applications.	3.94	0.830
	I will continue to use the delivery applications I am currently using.	3.91	0.837
	I am satisfied with the way that mobile food order applications have carried out transactions.	4.00	0.837

"Descriptive Analysis" means respondents' reaction to the promotion and discount went from 3.8 to 4.0. Respondents agreed that "I feel that discount provided encourages me to use mobile food delivery application services, " which means 3.94 (SD = 0.963). Meanwhile, "Terms and conditions of the promotion are important to me before I use mobile food delivery application services" scored the highest mean, which is 4.00 (SD = 0.920). The respondent agreed, "I think that promotion expiry date influences me in making an order"; the mean is 3.88 (SD = 1.027).

Besides that, the mean of respondents' reactions to the perceived price went from 3.3 to 3.6. The lowest mean at 3.34 (SD = 1.135) which is "I think that tax price in using mobile food delivery application services is reasonable" while the highest mean is "At the current price, mobile food delivery order apps provide a good value" has 3.60 (SD = 1.017). Meanwhile, for the first item, which is "I think the delivery price of mobile food delivery application services is reasonable" it has 3.48 (SD = 1.046) for the mean. The last one is item number three, which is "I feel that mobile food delivery application services overall price is affordable" has 3.49 (SD = 1.038) for mean.

Other than that, the mean of respondents' reactions to the convenience motivation went from 3.7 to 3.9. The lowest mean at 3.79 (SD = 0.915), which is "I would find it easy to become skilful at navigating through mobile food delivery application services web pages in the third item". In contrast, the highest mean go to the last item, that is "Overall, in using mobile food delivery application services, online shopping or transaction would be easy for me", has 3.97 (SD = 0.909). Meanwhile, for the first item, which is "I would find doing online shopping and web-based online transactions on mobile food delivery application services web pages easy", it has 3.80 (SD = 0.926) for the mean. The last one is item number two, which is "I would find interaction through mobile food delivery application services web pages clear and understandable" has 3.83 (SD = 0.914) for mean.

After that, for food quality, the mean score of four items starts from 3.7 to 3.9. The highest mean go to the last item, which is "The food looks attractive to me", at 3.96 (SD = 0.832) and followed by the second item ", The food is delicious", at 3.95 (SD = 0.799) for mean. Next, the first item, "The food smells good", scored 3.91 (SD = 0.801) for the mean, and the lowest mean goes to the third item, which is "The food is fresh", at 3.78 (SD = 0.849).

Lastly, for consumer satisfaction, the mean score of four items begins from 3.9 to 4.0. The highest score among others goes to the last item, which is "I am satisfied with the way that mobile food order applications have carried out transactions", at 4.00 (SD = 0.837), followed by the second item which is "I am satisfied with the food or service ordered through the delivery applications" at 3.94 (SD = 0.830). Meanwhile, the first item scored a mean of 3.93 (SD = 0.797): "I am overall satisfied with the delivery applications I am currently using". Lastly, the lowest mean goes to the third item, "I will continue to use the delivery applications I am currently using" at 3.91 (SD = 0.837).

Result of Reliability Analysis

Table 3 below shows the Reliability Analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Promotion and discount	3	0.845

Perceived price	4	0.937
Convenience motivation	4	0.937
Food Quality	4	0.653
Consumer satisfaction	4	0.929

The reliability of Cronbach's alpha value for promotion and discount is 0.845, which indicates well. While the price, perceived and convenience motivation is the same value and scored highest, which was 0.937. Food, quality is 0.653, which indicates well. However, consumer satisfaction in mobile food delivery applications is 0.929 and showed reasonable satisfaction.

Result of Pearson Correlation Analysis

Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Significant (p value)	Decision
H₁: There is significant relationship between promotion and discount and satisfaction in mobile food delivery application among generation Z in Malaysia.	r=0.560, p< 0.01	H₁ is supported
H₂: There is significant relationship between perceived price and satisfaction in mobile food delivery application among generation Z in Malaysia.	r= 0.576, p<0.01	H₂ is supported
H₃: There is significant relationship between convenience motivation and satisfaction in mobile food delivery application among generation Z in Malaysia.	r= 0.614, p<0.01	H₃ is supported
H₄: There is significant relationship between food quality and satisfaction in mobile food delivery application among generation Z in Malaysia.	r= 0.583, p<0.01	H₄ is supported

DISCUSSION AND RECOMMENDATION

Several challenges and limitations faced in the study will be highlighted for future research purposes. The surveys have a challenge in obtaining information for the overall success, resulting in invalid findings that should be excluded from the study. Future research is to increase the amount of information and reading materials, whether physical or digital, in the library, especially no matter where the library's location is either in urban or rural areas. Secondly, the study data were collected using an online questionnaire however, by using this method, the researcher could not identify the truth of the target respondent while answering the questionnaire. Therefore, in future research is researcher should be aware and cautious of the target respondent to be given to answer the questionnaire. This is because although the focused researcher is generation Z who are 10 to 27 years old, nowadays mobile phones are also given to children by their parents so that sometimes they have accidentally touched and damaged essential things found in the mobile phone; that is why the researcher must constantly monitor and be sensitive to each respondent who fills out the questionnaire so that it does not cause problems for researchers to key in and compile data on the next day. The last problem is the survey conducted also aims to identify suitable respondents for this study. Nevertheless, there

are many generations nowadays, but our questionnaire only focuses on generation Z. Future research can be conducted by using another generation X and above, as the target respondents. As we all know, users of mobile food delivery applications are not focused on generation Z because primarily those who use these applications are working adults who do not have enough time to cook and buy food.

CONCLUSION

In conclusion, this study has been accomplished to examine the factors of satisfaction in mobile food delivery applications among Generation Z in Malaysia. Four independent variables, namely promotion and discount, perceived price, convenience motivation and food quality, have been chosen to examine their relationships with the dependent variable, which is to examine the factors of satisfaction in mobile food delivery applications among generation z in Malaysia. A total of 361 respondents from the age of 10 years old and above were selected at 27 years old in Malaysia to examine the factors of satisfaction in mobile food delivery applications among generation z in Malaysia. Overall, based on Pearson's correlation analysis, the promotion and discount factor scored a value of *0.560, followed by perceived price with *0.576, convenience motivation with *0.614, and food quality with *0.583.

ABSTRACT

Electronic wallets or e-wallets/e-wallets allow users to make electronic buying and selling transactions quickly and easily. E-wallets are intended to replace physical wallets so that consumers do not have to carry wallets or handbags anywhere travelling and buying indirectly; the security aspects of consumers are enhanced, avoiding the risk of robbery or money dropped. Electronic wallets work just like pocket wallets. Electronic wallets were first recognized as a method of storing money in electronic form. Still, they later became known for their suitability in buying and selling transactions for internet users to store and use shopping information (online). The Malaysian government and foreign countries also accept and practice this method in buying and selling, tourism and business. Electronic Wallet is an electronic service to store payment instrument data to make payment transactions via smartphone by debit. The development of the increasingly advanced internet world is driving the use of electronic wallets as a more efficient transaction tool. This is evidenced by the number of e-commerce websites that use electronic wallets as a transaction tool. Several electronic wallet services are now widely used in online transactions, including PayPal, the most widely used electronic wallet. And other pioneers of electronic wallet services have emerged, such as Perfect Money, Skrill, Liberty Reserve, Neteller, Payza, OKpay, Egopay, Solid Trust, and others.

Keywords: E-wallet, perceived ease towards intention to use, perceived ease of use, and E-wallet adoption

INTRODUCTION

This chapter focuses on the research's background, problem statement, research question, research purpose, research hypothesis, and study significance. In addition, this chapter discusses the chapter's limits. Ever since the emergence of modern technology, which is used worldwide, there has been a wave of technology applications, one of which is the E-wallet. Compared to the traditional wallet that men and women use in their daily lives, the program has recently been dubbed a digital wallet (Uduji, Okolo-Obasi & Asongu, 2019). Furthermore, due to the simplicity of connecting to the internet, it cannot be denied that the usage of mobile phones has become prevalent in our everyday lives in this day and age.

Technology is developing very fast and making many changes worldwide, including digital technology, such as e-commerce and digital payment. As people become more familiar with digital technology, they also go online for other services, such as financial technology and entertainment services. The software substitutes the so-called analogy of buying things with physical currency with the new wave of the cashless economy that is currently gaining popularity worldwide. People are getting more familiar with technology, especially money transfer and payment services, such as mobile payments (PricewaterhouseCoopers, 2019). Acceptance of mobile payment services is increasing significantly in emerging markets. All of these technological advancements are accompanied by the widespread use of the internet, which allows for electronic cashless payment in the twenty-first century. The e-wallet system has unique payment qualities that allow a buyer to use their phone to make online transactions without having to use actual cash, and it can be done with just a single tap on their phone. Due to a surge in its usage, is now the preferred method of payment among consumers, particularly

among consumers of various age groups, the majority of whom are young people who are most familiar with the current wave of technology (Yaokumah, Kumah & Okai, 2017).

Nowadays, eating out has become part of regular social activities among Malaysians, whereby they meet friends, families, colleagues, and business partners to build relationships. The use of the e-wallet service has increased dramatically due to the apparent benefits of embracing a cashless economy. Of course, other factors include security concerns and the fact that it saves both the buyer and the consumer time when doing transactions (Nizam, Hwang & Valaei, 2018). Furthermore, this payment method provides consumers with convenience (Liebana-Cabanillas et al., 2014), as well as ease and speed in its use and operation (Alom et al., 2019). An E-wallet, also called a mobile wallet or digital wallet, refers to an online prepaid technology used to store money and conduct transactions online via smartphone. Currently, e-wallet is already an alternative and are slowly beginning to substitute traditional cash payment systems. It has tremendous potential to substitute other payment methods and become the most popular method to process transaction in the coming years (Cocosila & Trabelsi, 2016).

The type of digital transactions that e-wallet advancements function with the consistent use of a quick-response code (QR) code created by the vendor for the buyer to utilize throughout transactions. Boost, Alipay, Grab pay, Touch n Go, Big Pay, Fave pay, and other e-wallets that use QR codes in Malaysia include Boost, Alipay, Grab pay, Touch n Go, Big Pay, Fave pay, and several others that use a smartphone app available for download from the Google Play Store for Android users and the Apple Store for iOS users. Moreover, Touch n Go e-wallet is the fastest growing e-wallet app in Malaysia which currently has 9 billion registered users and over 135,000 merchants on its platforms (Fintech News Malaysia, 2020). Furthermore, Boost, introduced in 2017, remains one of the most prominent e-wallets in Malaysia. Boost has 135,000 merchant partners and over 5.1 million users (Bernama, 2020). Those e-wallet services have done an excellent job of transitioning the country into a cashless economy, with most points of sale no longer requiring real cash.

There are three objectives of this research:
1. To examine the relationship between perceived usefulness and e-wallet intention.
2. To examine the relationship between perceived ease of use and e-wallet intention to use.
3. To examine the relationship between E-wallet adoption toward payment in restaurants.

Significance of the study
Researcher
The research concentrates on perceived usefulness concerning e-wallet intention, perceived ease of use about e-wallet intention, and E-wallet intention to use about e-wallet adoption. The study's participants are Gen-Z from Malaysia who has used e-wallets that have done financial transactions before.
Generation Z
The generational cohort that follows Millennials and before Generation Alpha. According to Merriam-Webstar. October (2021), Generation Z, or Gen Z for short, is also known as zoomers. According to researchers and popular media, beginning birth years are the mid-to-late 1990s, and ending birth years are the early 2010s. The majority of Generation Z individuals are Generation X kids. Generation Z is known as the I-generation since they grew up with technology and the internet (Mohammed, 2018).
LITERATURE REVIEW
Perceived Usefulness
The degree to which an individual believes that adopting a specific application or technology can improve their performance experience is defined as perceived usefulness (Redzuan et al., 2016). The perceived utility immediately impacts information system behaviour intentions, assisting in the generation of actual conduct. The Technology Acceptance Model emphasized the importance of perceived belief and utilitarian perception in influencing technology usage,

such as system design quality and attributes. The aspects of information quality comprised relevance, accuracy, and timeliness, and such utilitarian values are required to modify their efficiency (Lederer et al., 2000). Suppose a technology or information system's perceived usefulness is strong. In that case, it leads to a positive usage relationship in which consumers will use it again and prefer it to other payment methods or possibilities (Aristovnik et al., 2016). Continuance intentions are a type of intention. Cheung and Chan (2003) defined postadoption behaviour as "continuance intention." It is a metric of possible intention or behaviour that may be used to forecast whether or not an individual will continue to utilize mobile payment services in the future (Limayem & Cheung, 2011. The goal of Park, Jun, and Park (2017) was to determine which factors influence the long-term desire to use a mobile payment system. Perceived usefulness has a strong, substantial positive link with satisfaction and continued use intention, according to the findings of this study. Furthermore, Devaraj, Fan, and Kohli (2002) discovered that in the context of eCommerce, the perceived utility significantly impacted satisfaction.

Furthermore, according to Recker (2016), perceived usefulness significantly impacts continuation intention. Users' comprehensive evaluations of the use of an e-wallet they already use could be a crucial factor in establishing their trust in the e-wallet. Researchers must analyze users' continued usage behaviour following initial acceptance in such studies (Kim and Son, 2009). Such research is much more relevant in the current research context since mobile payment markets are still developing, and it's challenging to keep people using the mobile payment app and not migrating to another service provider. It's crucial to look into the components that go into keeping a client relationship going because continuity intention entails deliberate and rational use, necessitating a long-term partnership (Bhattacherjee, Limayem & Cheung,2012).

Perceived Ease of Use

An e-wallet is a gadget or online service that allows people to make electronic transactions. This involves purchasing products on the internet using a computer or a smartphone. Individual accounts can be linked to the e-wallet as well. (Bennet, 2021). The development of increasingly sophisticated technology makes it easier for consumers to create purchases. An example, payment transactions previously made using cash, bank transfer, or check are replaced by e-wallet or e-wallet applications. The use of smartphones and internet networks also makes it easy for users to induce what they require. An announcement from Prihatin Spanco 2020, consumers who use the e-wallet as a payment tool can transfer money anytime and buy goods anywhere using a smartphone.

Additionally, consumers do not need to carry huge sums of money, reducing the risk of theft or loss (Nelson, 2020). Payments made with e-wallets provide convenience, speed and a sense of security, and comfort in transactions made anywhere and at any time (Liébana-Cabanillas et al., 2014). Digital transactions could even be safer because they can reduce the possibility of fraud as user information is well-tracked. Verification has got to be done before making a payment. This implies that if your smartphone is stolen, it'll still not be ready to access your e-wallet (AIA, 2020. Both parties must have this application and register on the identical banking system. For more details, e-wallets are intended to interchange with the physical wallet. According to Thomassen (2019), E-wallet payments had a beneficial impact on his firm. This could be because e-wallet payments are faster to process than credit card purchases, and customers prefer the e-wallet payment alternatives accessible in my store.

Payments made through e-wallets are easier and faster than payments made through traditional banking systems since they save time and money (Blockchains, 2018). Additionally, using these e-wallets can speed up the checkout process and improve overall consumer happiness. Most e-wallets have identical functionality. The user enters the credit or open account credit details within the app first, afterward, when desirous of making a payment within the shop, the user just has to use the app and scan a specific code on the cashier or the machine.

The user's smartphone will function as a card replacement. This way, the payment process isn't any more complicated as users don't must count money or the difficulty of saving the remaining money after completing the payment. This online or internet-based payment system is commonly utilized for transactions and payments, and it is done using mobile smartphone applications since users find it convenient (Gokilavani et al., 2018).

E-wallet Adoption

E-wallet adoption is defined as consumers' use of mobile payment services through e-wallets (Liebana-Cabanillas et al., 2018). It was found that the adoption rate of mobile payment was significantly influenced by several factors: usefulness, trust, and security (Sharmaa, Manglaa, Luthraa & Al-Salti, 2018). Usefulness is described as consumers' belief that using e-wallets is more advantageous than using the current payment method (Marinkovic, Milinillo & Liebana-Cabanillas, 2019). Promotional campaigns enhanced consumers' usage by stressing the usefulness of e-wallets (Oliveira, Thomas, Baptista & Campos, 2016). Then, trust is described as the degree to which consumers believe e-wallet services are feasible and valuable (Verkijika, 2018). Authors justified those past experiences affected consumers' trust in using e-wallet services (Hillman & Neustaedter, 2017). Security also explained that the perceived privacy risk and concerns occurred in e-wallet services (Wang, Luo, Yang & Qiao, 2019). Mobile payment technology has faced high-profile security breaches in the past and thus causing consumers' low confidence in security (Johnson, Kiser, Washington & Torres, 2018). Ease of use is described as the consumer's perception of an e-wallet as a feasible and convenient tool. Users favoured new technology when the services provided were easily accessible (Boden, Maeir & Wilken, 2020). Traditional payment approaches, which were debit cards, credit cards, and cash, could be substituted by e-wallets only when it was more convenient for users (Johnson et al., 2018).

Research Hypothesis

In this study, the three hypotheses tested are:

> H1: Perceived usefulness is significantly related to e-wallet
> intention to use
> H2: Perceived ease of use is significantly related to e-wallet
> intention to use
> H3: E-wallet adoption toward payment in restaurants.

Research Framework

Figure 1: Research Framework adopted from Yang, M, Mamun, A. A, Mohiuddin, M, Nawi N.C., & Zainol, N.R (2021) and (Fred Davis, 1986)

METHODOLOGY

Research Design

The research design is also a construction of research and is an instrument that constitutes the research study with the combination of all the critical components Akthar (2016). It is a comprehensive strategy used by researchers to rationally and reasonably combine multiple study components to attain the research objectives (Burns and Bush, 2010). Research design is the crucial part of the research as it includes all four important considerations: the strategy, the conceptual framework, the identification of whom and what to study on the tools and procedures to collect and analyse data. The research design is divided into several types, for example, qualitative research and quantitative research (Holmes R et al., A Guide to Research in the Social Sciences (Malaysia: Pearson, 2005),18.

According to Kothari (2004), research might be either a quantitative single-stage or multi-stage design. The closed-ended questions provided data for the quantitative research method, which was used to evaluate the relationship between variables. The quantitative research approach was employed in this study because it allows the researcher to test hypotheses by analyzing the established hypothesis. The quantitative research method analyzed the relevant data using statistical procedures and numerical coding, providing in-depth insight into the phenomena of interest. Furthermore, according to Sekaran and Bougie (2016), the quantitative research approach can aid in defining the properties of observed occurrences and investigating potential relationships between variables. To acquire the required data from the intended respondents, a collection of questionnaires, including a series of closed-ended questions, would be circulated.

Furthermore, conclusive research may be divided into two types: descriptive research and casual research. Descriptive research aims to better understand phenomena, gain new insights, and formulate a more concrete research problem or hypothesis. Casual research, on the other hand, is intended to examine the cause-and-effect relationships between variables. In addition, descriptive research is divided into two types: cross-sectional and longitudinal designs. The cross-sectional design is a one-time data collection technique that assists the

researchers in identifying the commonness of research findings in specific time points (Levin, 2006).

Data Collection

Before completing the survey in greater depth, a pilot test with 30 respondents from generation Z was undertaken to ensure the study's dependability. Fieldwork was continued by randomly sending surveys to 384 target respondents through Google Forms on their acceptability of using e-wallets at restaurants upon consent from respondents. Respondents were expected to use a five-point Likert scale to answer all questions. The data was obtained once the respondents had completed all of the surveys. To verify the information received, researchers personally collected surveys from respondents. With a total of 243 valid surveys, the final questionnaire gathered had a response rate of 63.28 percent.

Sampling

The researchers used convenience sampling as a non-probability sampling approach for their investigation. Convenience sampling is a sort of sampling in which the study relies solely on the first available primary data source. To put it another way, this sample strategy entails gathering people wherever they are, usually the most convenient area. Before selecting participants for inconvenience sampling, no inclusion criteria were established.

Data Analysis

The population of this research paper is the number of local tourists in Malaysia, and the sample size is determined from the table of Krejcie & Morgan (1970). Thus, the sample size for this research paper is 243 respondents; independent variables and dependent variables are distributed to local tourists in Malaysia to collect data. The data collected from respondents proceeded with the statistical package for the social science (SPSS). Data analysis included the reliability analysis, frequency analysis, descriptive analysis, and Pearson's Correlation analysis.

FINDINGS

Profile Sample

Table 1: Demographic Profile

Respondent Profile	Classification	Frequency N=243	Percentage (%)
Age	16 – 18	38	15.6
	19 – 21	81	33.3
	22 – 24	124	52
Gender	Male	94	38.7
	Female	149	61.3
Race	Malay	137	56.4
	Chinese	66	27.2
	India	38	15.6
	Bajau	2	0.8
Status	Single	160	65.8
	Married	63	25.9
	Divorce	20	8.2
Occupation	Student	116	47.7
	Self-employed	43	17.7
	Not-employed	21	8.6
	Government	38	15.6
	Private sector	25	10.3
Income Level	Less than RM1,000	140	57.6
	RM1,001 – RM1,500	21	8.6
	RM1,501 – RM2,000	35	14.4
	RM2,001 – RM2,500	24	9.9
	RM2,501 and above	23	9.5

Educational Level	High School	59	24.3
	Diploma	52	21.4
	Degree	132	54.3

Table 1 shows the characterization of respondents.15.6% of the respondents were aged 16- 18 years old, 33.3% of the respondents were aged between 19-21 years old, and lastly, 51% of the respondents were aged between 22-24 years old. 94 out of 243 respondents are male, representing 38.7%, while 149 are female, representing 61.3%. For Chinese and Indian, there were 66 27.2% respondents and 38 15.6% respondents, respectively. Most of the respondents were reported to be Malay, summing up to 137, 56.4% of respondents. Meanwhile, only 20 of 8% of respondents are reported to be of other races instead of Malay, Chinese or Indian. Next, most of the respondents were single, making up 160 65.8% of respondents.

On the other hand, married and divorced status represented 63, 25.9% respondents and 20, 8.25% respondents, respectively. The occupation of 243 respondents is divided into 5 categories. There were students, self-employed, not-employed, government and private sector. Most respondents were from student categories which are 116 47.7%. Next, self-employed and not-employed represented 43, 17.7% and 21, 8.6%. For the government, the sector shows 38, 15.6% of respondents, and the private sector shows 25, 10.3%. Then, respondents earning less than RM1,000 per month were the highest, which stands at 140 (6%).

The second highest group is represented by respondents who earn between RM1,501-RM2,000 per month, representing 35 (14.4%) respondents. There were 23 (9.5%) respondents earning above RM2,501 per month. The group of respondents, who earn between RM1,001 - RM1,500 and RM2,001 - RM2,500 per month, represented by 21 (8.6%) respondents and 24 (9.9%) respondents. There were 59 (24.3%) respondents from high school, and 52 (21.4%) respondents from diploma education. Lastly, the highest number of respondents for the educational level part is from degree students who are 132 (54.3%) respondents.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variables	Statement	N	Mean	SD
Perceived Usefulness	Using an e-wallet might help me be more efficient while making payments	243	3.80	1.053
	Using an e-wallet might help me perform better in terms of financial transactions.	243	3.71	0.996
	I have more control over my payment activity with an e-wallet.	243	3.84	1.037
	Using an e-wallet allows me to do a lot of things more quickly	243	3.78	0.986
	Overall, I find an e-wallet to be beneficial.	243	3.79	1.048
Perceived Ease of Use	If I have enough time, I can complete my transactions with an e-wallet.	243	3.70	1.123
	Even if no one is around to assist me, I can use my e-wallet to complete my transactions	243	3.93	0.964

	I can use an e-wallet to conduct my transactions utilizing simply a short manual or online guidance as a guide	243	3.70	0.998
E-Wallet Adoption	I am familiar with e-wallet technology	243	3.73	1.045
	The e-wallet provider's level of service exceeded my expectations.	243	3.65	1.185
	My experience with utilizing an e-wallet exceeded my expectations.	243	4.00	0.990
	I prefer to utilize an e-wallet rather than any other payment option	243	3.60	1.000
	I intend to continue to use e-wallet services regularly.	243	3.74	1.070
	I will strongly advise others to utilize an electronic wallet	243	3.64	1.057

The descriptive analysis of Perceived Usefulness. It shows the mean of respondents' responses on the Perceived Usefulness variable according to the five-Likert Scale. The mean score for five (5) items in Perceived Usefulness ranges from 4.5 to 4.8. To elaborate, the mean for the first item is the highest, which is Using an e-wallet might help me be more efficient while making payments, scoring 3.80 (SD = 1.035). The mean score for the fourth item, which is Using an e-wallet might help me perform better in financial transactions, scored the same as the first item, which is 3.71(SD = 0.996). The mean score for the second item, which is I have more control over my payment activity with an e-wallet, reported at 3.84(SD =1.037). The mean score for the third item, which is Using an e-wallet allows me to do a lot of things more quickly, was 3.78 (SD = 0.986). Lastly, the mean score for the fifth item, were using an e-wallet allows me to do a lot of things more quickly. Overall, I find an e-wallet beneficial was 3.79 (SD = 1.048).

Secondly, the descriptive analysis for Perceived ease of use. The mean score of the five items in Perceived ease of use ranges from 4.3 to 4.8. To elaborate, the mean score for the last item, which is if I have enough time, I can complete my transactions with an e-wallet" showed the highest score at 3.70 (SD = 1.123), Even if no one is around to assist me, I can use my e-wallet to complete my transactions follow by Even if no one is around to assist me, I can use an e-wallet to conduct my transactions utilizing simply a short manual or online guidance as a guide scored 3.93(SD = 0.964), I can use an e-wallet to conduct my transactions utilizing simply a short manual or online guidance as a guide scored 3.70 (SD = 0.998), and lastly the item "I am familiar with e-wallet technology." scored the lowest at 3.73 (SD= 1.045).

Thirdly, the descriptive analysis for dependent variable-wallet adoption. It shows the mean score of five items ranging from 3.2 to 3.9. To elaborate, the mean score for the last item. "I will strongly advise others to utilize an electronic wallet" scored the highest at 3.64 (SD = 1.057), followed by "I intend to continue to use e-wallet services regularly" which scored 3.74 (SD = 1.070). Next, the item "My experience with utilizing an e-wallet exceeded my expectations" scored 4.00 (SD = 0.990), and the mean score for "I prefer to utilize an e-wallet rather than any other payment option" was reported at 3.60 (SD =1.000). Lastly, the mean score for the item "The e-wallet provider's level of service exceeded my expectations" scored the lowest at 3.65 (SD = 1.185.

Result of Reliability Analysis
The table below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Perceived Usefulness	3	0.898
Perceived Ease of Use	3	0.865
E-wallet Adoption	3	0.878

Following the Pilot Reliability Test, the usable questionnaire, which includes 243 respondents, will be subjected to a real reliability test. The reliability Cronbach's alpha coefficient value for reliability was 0.898, indicating excellent reliability. In contrast, reliability Cronbach's alpha coefficient value for assurance is 0.878, which indicates well. However, e-wallet adoption gained only 0.944, which indicates questionable.

Result of Pearson Correlation Analysis

The table below shows the Pearson Correlation Analysis result in which we know that hypotheses H1 and H2 have a significant relationship between them and were accepted.

Table 3: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/ Not Supported)
H1: There is a significant relationship between perceived usefulness and e-wallet adoption	0.556	H1 is supported
H2: There is a significant relationship between perceived ease of use and e-wallet adoption	0.569	H2 is supported

Based on the H1 result, there is a positive correlation coefficient of .556** based on the findings, indicating that the association between perceived usefulness and e-wallet intention to use is positively strong. Therefore, perceived usefulness is strongly related to determining the intention to use e-wallets in restaurants all around Malaysia. Meanwhile, the significant level is <.001, which is less than the standard criteria of 0.5, which also indicates a significant relationship. As a result, the hypothesis (H1) that there is a significant correlation between perceived usefulness and e-wallets' intention to use when paying for their meal at restaurants is accepted.

Meanwhile, the correlation coefficient is positive at .569**, indicating a strong association between perceived ease of use and e-wallet intention to use. As a result, perceived ease of use strongly impacts e-wallet intention to use when they are paying in any restaurant that offers that payment method. The significance level of the two variables is <.001, which is less than the conventional criterion of .05, indicating a meaningful relationship, as shown in the table. As a result, hypothesis (H2) is accepted, stating a significant association between perceived ease of use and e-wallet intention to use.

DISCUSSION & RECOMMENDATION

Several challenges and limitations were faced in the study and are to be highlighted for future research purposes. The respondent's behaviour in answering the questionnaire was doubted truthiness which will eventually result in an invalid finding that should be excluded from the study. The researcher has faced challenges such as time constraints in conducting fieldwork, respondent's behaviors and accessibilities, and doing research away from group members. The questionnaire adopted from previous studies is limited to only a single language, whereby researchers must translate and apply at least a bilingual statement (Malay language) to low respondents to answer based on their language preferences. Besides, respondents are also limited to only those who can understand English and Malay. Therefore, future research should consider the survey's locality, as customers from different states in Malaysia may have differing opinions based on their demographic profiles.

CONCLUSION

This study aimed to determine whether gen-z accepts the use of e-wallets in restaurants. Overall, the findings revealed that perceived usefulness and perceived simplicity of use have a moderate negative impact on e-wallet adoption in restaurants from the perspective of Generation Z. Customers will accept the use of e-wallets at restaurants, according to the survey, even though the determinants are still far from reaching their maximum level.

ABSTRACT

Various studies are investigating Customer Awareness of Muslim Friendly Hotels in Malaysia. Many people love to travel in Malaysia. However, there is little data on customer awareness of Muslim-friendly hotels in Malaysia. Therefore, research on this topic is an important matter. The aim is to see the relationship between hotel facilities and customer awareness of Muslim - friendly hotels in Malaysia. It also investigates the relationship between room amenities and customer awareness of Muslim-friendly hotels in Malaysia and the relationship between halal food and customer awareness of Muslim-friendly hotels in Malaysia. An online survey will be conducted among Malaysians who love to have a vacation at Muslim-friendly hotels. Respondents will be selected using the non-probability purposive sampling method. The study was to identify the relationship between hotel facilities, room amenities, and halal food in the customer awareness towards a Muslim-friendly hotel in Malaysia. There were 311 participants, and it was done via social media platforms such as Instagram, Facebook, WhatsApp, and Telegram. The questionnaire was divided into four sections; each required prior informed consent. Since every traveller will pay attention to the issue of halal cuisine, the study results show that halal food is an important aspect that must be present in every hotel to attract the attention of Muslim customers.

Keywords: Hotel, Muslim Friendly, Travel, Awareness, and halal food

INTRODUCTION

A Muslim-friendly hotel has Islamic elements such as Qibla direction indicator, prayer materials, halal food, the lack of alcoholic beverages in Islamic hotels and the presence of a mosque in the hotel area. According to Jeaheng, Al-Ansi and Han (2019), a deeper understanding of the precise needs and behaviour of the Muslim customer is required before implementing any service to ensure the most straightforward practices are applied. The Muslim travel sector is rapidly growing and has established itself as an essential segment of the tourism industry. Malaysia is one of the most popular tourist destinations among Muslim tourists, owing to its rich Islamic tradition and values in tourism products and services. Muslim travellers know Malaysia has many Muslim-friendly facilities.

Many people's lifestyles have changed due to modernization, work stress, developments in communication technology, the availability of low-cost airlines, and rising household income, particularly in Islamic countries.. Knowledge, education, business, umrah, and hajj are no longer the only reasons to travel in modern times. The

rise in Muslim travelers has significantly impacted the global hospitality industry's concept. It is time for the tourism industry to consider the new concept of Muslim-friendly hospitality services. Muslim-friendly hospitality is a good deed that involves accepting and meeting the fundamental needs of consumers, such as providing food, drink, and lodging to individuals who are visiting for a short or long period in one location, such as hotels and resorts for leisure or business.

Today, an increasing number of Muslims, particularly those who travel to other nations. When they do, they look for a way of life that is respectful to their religion. Muslim travellers are particularly interested in Muslim-friendly hotels. These hotels cater to halal travellers, who eat the food that is permissible for Muslims to consume. Signs are pointing in the direction of Qibla in the rooms, as well as an alcohol-free eating area and separate spa and swimming sections for men and women.

1.1 To measure customer awareness towards Muslim-friendly hotel in Malaysia.
To identify the attribute of Muslim-friendly hotels in Malaysia.
1.2 To identify the attribute of Muslim-friendly hotels in Malaysia
      1.2.1 To identify the relationship between hotel facilities and customer awareness towards
      Muslim-friendly hotel in Malaysia.
      1.2.2 To identify the relationship between room amenities and customer awareness towards
      Muslim-friendly hotel in Malaysia.
      1.2.3 To identify the relationship between halal food and customer awareness towards
      Muslim-friendly hotel in Malaysia.

SIGNIFICANCE OF THE STUDY

In this study, there are several stakeholders who will get the benefit as follows:

Muslim customer

Muslim means someone involved in the act of movement, acceptance or surrender. Therefore, a Muslim submits to God's will or is a follower of Islam. The word Muslim is used in conversation to qualify or differentiate a person. It can also be defined as a brief description of one's religious beliefs. The client, on the other hand, is a person, a group of people or an organization who receives or may receive goods, services, products or ideas from another person or a corporation in exchange for money or anything of equivalent value.

Non-Muslim customer

Non-Muslim means a person who is not a Muslim or has a belief or religion other than Islam. In many writings, non-Muslims are referred to as infidels. Therefore, non-Muslims or infidels, according to sharia, an attribute of a person who disobeys a law that has been prescribed and mandated by Allah S.W.T. Therefore, Halal ideals can thus be popularized among non-Muslim consumers if the society as a whole is made more aware of issues such as health, cleanliness, safety, the environment, social justice and animal welfare and all of which are accompanied by Halal methods of doing things (Golnaz, Zainalabidin & Nasir, 2012).

Government of Malaysia

The increase of Muslim hotels in Malaysia will greatly impact the government. It is because various benefits will be obtained when the hotel industry, especially Muslim hotels, manage as best as possible their service process throughout the hotel's operation. Therefore, it will help the government attract more customers, especially tourists from abroad who are Muslims. For example, the Ministry of Tourism, Arts and Culture

(MOTAC) will help the hotel industry constantly attract more foreign tourists to the hotels with greater quality services and hospitality.

LITERATURE REVIEW
OVERVIEW OF MUSLIM FRIENDLY HOTEL

Muslim friendly hotel is still considered a new concept in Malaysia's hospitality field. However, many people are still unclear and confused about the concept of the hotel. Most of them think that this hotel is only meant for Muslims. It can lead to misunderstandings and conflicts between hotel operators and customers or guests. One of the reasons why Muslim Friendly Hotel is not well received is because the concept of the hotel is more for Muslims. As a result, it may be complicated due to non-Muslim and Muslim tourists' contrasting reactions.

Furthermore, the primary notion is that non-Muslims regard destinations in some Islamic countries as distinct from those in other "Western" countries (Alom et al., 2019). A Muslim-friendly hotel has Islamic characteristics, such as Qibla direction signs, prayer equipment, halal food preparation or a list of neighboring eateries that serve halal food, and segregation of swimming pools for men and women. It is also included the absence of alcohol and illegal food on the hotel premises. In addition, halal certification is a process in which a government-controlled body or a reputable Islamic organization inspects and certifies that the products comply with the Shariah and that Muslims can consume them legally.

Hotel Facilities

The five daily prayers are an obligation that a Muslim must perform in their life and this can be proven according to Islam-world.net (2011). This is the second pillar of Islamic teachings, according to which a Muslim must pray five times, namely before dawn (Subuh), noon (Zuhur), afternoon (Asar), after sunset (Maghrib), and evening (Isyak). So, it is important for a Muslim to perform their ibadah in a clean and suitable place; for example, a mosque or prayer room should be created in a Muslim hotel to indirectly facilitate the affairs of visitors in performing ibadah. Al-Hamarneh and Steiner (2004) agree that a mosque, which refers to a Muslim's house of worship or prayer room, is one of the most important amenities for Muslims.

Room Amenities

Most the visitors will focus on the position of the bed in this case because in Islam, the position of a person's sleeping body is not recommended to direct both feet facing the Qiblah . After all, it does not respect the Kaaba, the Qiblah for Muslims. However, when Muslims perform ibadah, such as reciting the Quran, taking ablution, and reciting prayers, it is recommended to face the Qibla. In this Muslim hotel, they have provided the Qibla direction which is usually displayed on the coin above the hotel room. This is to make it easier for visitors to perform worship in their rooms. Many Muslim-friendly hotels throughout the world provide amenities like prayer mats, timetables, and prayer attire for ladies. Several hotels also provide a Quran in each guest room and Qibla headings in the rooms. This way makes a guest feel comfortable and do not have to worry about the preparations needed to perform ibadah whenever they travel.

Halal Food

Finding halal food is important for a Muslim as most hotels will serve liquor on one of their menus. Serving alcohol-free drinks in a Muslim hotel is connected with a healthy lifestyle, which is more enticing to everyone. To make this happen, however, Muslim hotels face difficulty in ensuring customer happiness, as well as providing services to these consumers that are wealthy enough to allow competitive comfort and luxury while maintaining the spiritual quality desired by the customer. In addition, these food services and industries still lack knowledge about alcohol which is alcohol sales are immensely profitable and constitute a sizeable portion of revenue for many hotels. So, this shows that this issue is still arguable and

debatable because Islam values are more important for Muslims, and hotels incorporating these values are the ones that best suit their needs.

Hypotheses

H$_1$ There is a relationship between hotel facilities and customer awareness towards Muslim-friendly hotels in Malaysia.

H$_2$ There is a relationship between room amenities and customer awareness towards Muslim-friendly hotels in Malaysia.

H$_3$ There is a relationship between halal food and customer awareness of Muslim-friendly hotels in Malaysia.

Conceptual Framework

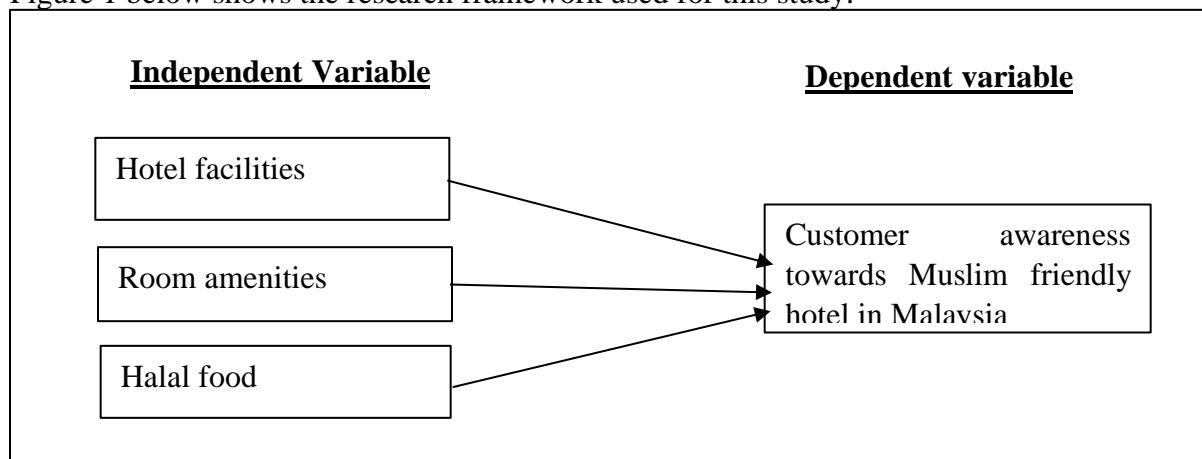
Figure 1 below shows the research framework used for this study.


Figure 1: Research Framework

METHODOLOGY

Research Design

Research design ensures that the evidence obtained allows the researcher to effectively address research problems logically and clearly. To shape appropriate research to obtain information relevant to a research problem, researchers must first determine the type of evidence required to test a theory, describe and evaluate the meaning associated with an observable problem, and use the quantitative methodology to investigate similar issues. Quantitative styles are used to understand the process of collecting and analysing numerical data. It can find patterns, test productive connections, and generalize results to a broader population.

Population

Customers in Malaysia were the main target population, consisting of males and females aged 19 and over. To obtain data related to customer awareness of Muslim-friendly hotels as a whole, the researcher will distribute a questionnaire to all customers who have used or have never used the service. The researcher aims to get the respondents who are reached from different demographics, including race, age, and education levels.

Sample Size

Sample size is some persons chosen from the general community to reflect the entire population in a study. Inappropriate, too large, or too small sample sizes affect study quality and accuracy. The number' stands for sample size. The Krejcie and Morgan approach for estimating sample size in research is widely used. The following formula was used by Krejcie and Morgan (1970) to determine the sample size:

$$s = \frac{x^2 N_P (1 - P)}{e^2 (N - 1) + x^2 p (1 - P)}$$

s = required sample size

X2= Table value of chi-square for one degree of freedom at the desired confidence level

N = Population size (assumed to be 1 million)

 P = Population proportion (assumed to be 0.5 or 50%)

D = Degree of accuracy (assumed to be 0.05 or 5%)

Sampling Method

The researcher can utilize one of two sample approaches in this study: probability sampling or non-probability sampling. The critical criterion for probability sampling is that each of the N sampling units has a specific, known probability of selection and that none of the units has a probability of zero. There are a plethora of options within this constraint. The sampling technique will be used is simple random sampling; the probability sampling technique necessitates a general specification of simple random sampling.

Data Collection Method

Data collection is the process of gathering, measuring, and evaluating correct viewpoints for study using recognized, validated procedures. A researcher's hypothesis may be evaluated based on the evidence gathered. In most cases, data collection is the first and most crucial step in the research process. The process of gathering and measuring information regarding variables of interest in a well-established systematic fashion allows one to answer stated research questions, test hypotheses, and assess results.

Primary data is acquired directly from the source of the information and is considered the most basic type of data in research. Primary data is information obtained directly from primary sources such as interviews, surveys, and experiments by researchers. Primary data sources are usually chosen and adjusted to meet the demands or objectives of a particular scientific study. It is vital to figure out what the research's goal is and who the target demographic.

In this study, a questionnaire was used to collect accurate data on customer awareness towards Muslim-friendly hotels in Malaysia. The questionnaire will be created using Google Forms, making it easier for respondents to answer the questions given. Following that, the google form link will be sent via telegram, WhatsApp, and email platforms so that the respondent can answer the question, making it easier for the researcher to get answers quickly and not have to wait a long time for responses from the respondent. Using this method also does not require a strong internet connection, and respondents can also answer whenever they have free time, allowing them to respond in a calm manner without having to rush in giving answers when asked questions at the same time.

Research Instrument

Part A, B, C, and D are the questionnaire's four sections. A self-completed questionnaire will collect the data for this study. This questionnaire is being modified and developed to consider the respondents' different backgrounds. In addition, due to any problems, the researcher also prepared the questionnaire in two languages: English and Malay. This it will make it easier for the respondents to answer the questionnaire.

Closed-ended questions are prevalent in surveys because they yield higher response rates. This is because closed-ended questionnaires do not require as much typing as open-ended questionnaires do, such as "yes" or "no" and questions that may be replied to with a single word or questions in which participants are given options to pick from, such as agree, disagree, or neutral. Closed-ended responses are also simple to examine statistically, which is what most people want to do with survey data. Respondents do not need to think of their own words to write because the researcher has already provided possibilities for them to choose from. This survey does not take long to complete, and all they have to do is to; all they have to do is choose one of the response alternatives.

Therefore, some the respondents do not entirely comprehend the query. Still, as they answer and consider the available response choices, they can gain a better understanding and knowledge of what have being asked. The interval scale aids researchers in performing numerical operations on data collection such as calculating the magnitude of individual preference variations. As previously stated, each of the study's instruments is being adapted and developed into five sections, with the Likert-scale instrument being used to determine the level of agreement (Mas'adeh, 2016).

Data analysis

The most crucial aspect of every study is data analysis. Data analysis is a summary of the information that will be gathered. It also entails the analysis and interpretation of data to establish a pattern, link, or trend using analytical and logical reasoning. Data analysis is also defined as analyzing, organizing, changing, and transforming data to obtain meaningful information. Furthermore, ensuring that the data analysis is carried out responsibly is critical. Aside from that, other processes must be followed when doing a research experiment. In this study, the researchers will collect statistical data using the Statistical Analysis for the Social Science (SPSS) Statistic at version twenty-eight.

FINDINGS

Results of Frequency Analysis

Part A for background information which are about respondents' demographic profile.

Characteristic	Frequency	Percentage
Age		
10-20 years old	51	16.4
21-30 years old	186	59.8
31-40 years old	20	6.4
41-50 years old	43	13.8
50 years above	11	3.5
Marital Status		
Single	221	71.1
Married	88	28.3
Others	2	0.6
Race		
Malay	306	98.4
Chinese	2	0.6
Indian	1	0.3
Education Level		
Bachelor	190	61.1
Spm	61	19.6
Diploma	32	10.3
Stpm	16	5.1
Master	9	2.9
Pondok	1	0.3
Skm	2	0.6
Did you aware about the existence of Muslim Friendly Hotel?		
Yes	273	76.2
No	74	28.3

Do you prefer staying in Muslim Friendly Hotel when travelling?			
Yes	290	93.2	
No	21	6.8	
Have you ever experience staying in Muslim Friendly Hotel?			
Yes	154	49.5	
No	157	50.5	

The question for a demographic profile from the 311 respondents shows that the frequency with the highest age is (F=186) for the 21-30 years old. Then, the highest of marital status is (F=221) for the single. Meanwhile, the highest respondent from the race is (F=306) for Malay and characteristic of education level is Bachelor (F=190), SPM (F=61), Diploma (F=32), STPM (F=16), Master (F=9), Pondok (F=1) and SKM (F=2).

In addition, in the characteristic "Did you aware about the existence of Muslim Friendly Hotel?" the 311 respondents choose yes with (F=273) while the characteristic "Do you prefer staying in Muslim Friendly Hotel when travelling?" the majority of respondents choose yes with (F=290).

Result of Descriptive Analysis

Descriptive analysis is also known as descriptive analytics or descriptive statistics. This is the process of using statistical techniques to describe or summarize information that was conducted based on the data collected from the 311 respondents.

Variable	Items	Mean Score	Standard Deviation
Hotel Facilities	Majority of the hotel staff are Muslim.	4.34	0.78
	The hotel provide the Qibla sign (direction of Makkah)	4.67	0.61
	No place of entertainment.	3.81	1.00
	Decoration and art should not depict the human and animal form	4.40	0.85
	Separated floors for single male, single female and Families are provided.	4.24	0.96
Room Amenities	Al - Quran is placed in the hotel room.	4.28	0.94
	Praying mats are provided in the hotel rooms.	4.53	0.78
	Television broadcasts are selected only that are beneficial to the consumer	4.14	0.97

	The hotel rooms are cleaned daily	4.68	0.61
	Wet clothes are provided in the hotel bathroom.	4.38	0.90
Halal Food	Halal mineral water is provided to consumers	4.76	0.52
	There are non-halal foods like pork.	4.78	0.53
	The cuisine at the compliant shariah hotel is prepared according to shariah requirements.	4.75	0.54
	The hotel will ensure that the snacks provided have the halal logo and emblem	4.76	0.54
	Authorities approved halal certificates with stricter conditions.	4.76	0.50

The question for hotel facilities the majority of the hotel staff are Muslim (m=4.34), the hotel provides the Qibla sign (direction of Makkah) (m=4.67), no place of entertainment (m=3.81), decoration and art should not depict the human and animal form (m=4.40), and separated floors for single male, single female and Families are provided (m=4.24). Next, for the question room amenities, Al - Quran is placed in the hotel room (m=4.28), praying mats are provided in the hotel rooms (m=4.53), television broadcasts are selected only those that are beneficial to the consumer (m=4.14), the hotel rooms are cleaned daily (m=4.68) and wet clothes are provided in the hotel bathroom (m=4.38). Lastly, for the halal food question, halal mineral water is provided to consumers (m=4.76), there are non-halal foods like pork (m=4.78), and the cuisine at the compliant shariah hotel is prepared according to shariah requirements (m=4.75), the hotel will ensure that the snacks provided have the halal logo and emblem (m=4.76) and authorities approved halal certificates with stricter conditions (m=4.76).

Result of Reliability Test
Reliability Analysis is a procedure that calculates various commonly used measures of scale reliability and information about the relationships between individual items on the scale. Estimates of inter-rater reliability can be computed using interclass correlation coefficients. So, using Cronbach's Alpha Coefficient in Statistical Package for the Social Sciences (SPSS) is used for this study.

Variable	Number Of Items	Cronbach Alpha
Hotel Facilities	5	0.694
Room Amenities	5	0.748
Halal Food	5	0.898

Customer Awareness Toward Muslim Friendly Hotel	4	0.521

The result of Cronbach's Alpha values of the questionnaire was in the range of low acceptance level (0.4) to very high acceptance level (0.9). There are five total number questions for each Independent Variables has been tested using reliability Cronbach's Alpha. The number of items is four for the dependent variable is customer awareness towards a Muslim-friendly hotel in Malaysia, and the Cronbach alpha is 0.521. After that, for independent variables is hotel facilities, Cronbach alpha is 0.694. Next, room amenities and the Cronbach alpha is 0.748 and then halal food where is Cronbach alpha is 0.898. For the independent variable in number of items is five.

RECOMMENDATIONS

This research is studied through value and satisfaction based on Muslim customers regarding Muslim-Friendly Tourism in Malaysia. Therefore, this research has shown the variable of Muslim customer satisfaction (dependent variable) and hotel facilities, room amenities, and halal food (independent variable). There were significantly correlated with the dependent. It has a very positive correlation relationship. Future research could also be used by other variables such as hotel facilities and halal food.

First and foremost, hotel facilities should make the customer feel special. This is because using customized welcome messages, such as "Welcome back" if the guest has previously stayed, is what it means to make it unique. There's also the chance to promote special discounts, new features, and hotel services.

Furthermore, the recommendation can provide exclusive deals based on room amenities. These exclusive deals are intended to make guests happy and excited. This is an exclusive call because the deals are not available everywhere else. Furthermore, the hotel administration can offer discounts and packages based on their interests, such as vouchers and tickets that can be utilized at restaurants or retailers affiliated with the hotel.

Finally, for Muslim Friendly Hotels, the proposal for halal food is to strengthen the halal food supply chain. Every Muslim-Friendly Hotel should serve halal food to all of its customers. This is because Muslims place a high value on religion. As a result, they can only use halal products. Furthermore, all food served and searched by hotel management must bear the halal logo and be designated halal to ensure that all Muslims can enjoy it.

CONCLUSION

This research was conducted on customer awareness of Muslim -friendly hotels in Malaysia. Throughout this research, researchers have studied the relationship between independent variables and dependent variables. The parties benefiting from this research are the owners and employee of food and beverage, customers and future researchers.

There are certain limits to this research. The researcher's concern is the data gathering procedure, which is the first constraint. Data can be missing, incorrect, invalid, or incomplete at times. Because specific questions in Google Forms can be marked or answered several times, this is the case. Researchers can solve the challenge by redoing their work and being more diligent in obtaining accurate results. There are certain limits to this research. Furthermore, online surveys were used in this study, which were was distributed via Google forms. Respondents are unable tocannot express a minor opinion using this method because the questionnaire only has multiple choice questions for them to answer. Furthermore, online surveys were used in this study, which was distributed via Google forms. Respondents cannot express a minor opinion using this method because the questionnaire only contains multiple choice questions.

Customer Satisfaction Towards Usage Of Food Delivery
Applications During Covid-19: Malaysia Outlook

ABSTRACT

This study is about Customer Satisfaction with the usage of Food Delivery Applications during Covid-19 in Malaysia. Coronavirus 2019, also known as Covid-19, is an infectious disease caused by a virus that causes respiratory infection in humans. Food delivery service is sending food to a customer after placing an order through online applications. The consumer can now choose from a diverse range of food providers listed on the internet at any time and location. High technology alters people's lifestyles by providing a variety of applications to assist them, such as an online delivery application. This study relates to convenience, time savings, and perceived value. Use a quantitative method to complete this research. Google Forms was used to distribute 384 questionnaires. The result is based on descriptive analysis, reliability test, and Inferential Analysis (Pearson's correlation analysis.

Keywords: Household, Food Waste, Attitude, Value of Awareness

INTRODUCTION

A customer makes an order through applications; the restaurant needs to prepare food and give it to a delivery driver. Customers must simply wait at home for their meals. It is because delivery service has many benefits to the user such as food delivery service is easy to use, time-saving, various food and price. When there is a lockdown, online food delivery increases and has become the new normal for people today.

Customer demand for OFD services has risen dramatically in recent years and will continue to rise consistently (Hong, Choi, Choi & Joung, 2021). Food delivery service has many advantages for users, such as its ease of use, time savings, variety of foods, and low prices. The advancement of internet technology and the increased use of smartphones have prompted the establishment of several OFD ordering service system start-ups. Online service delivery is on the rise because it is simple and convenient, especially for busy people with multiple responsibilities and little time to go out and buy food. Food Panda, Grab Food, Food Ninja, and others are popular online delivery apps in Malaysia.

Covid-19 is transmitted from one person to another by the air or by direct or indirect contact. During the movement control order, the government has ordered all sectors, including restaurant operations, to close (MCO). Aside from that, the government encourages social distancing, and consumers are not permitted to eat in restaurants to prevent the virus from spreading. They use an online delivery service to their new normal during COVID-19 pandemic and are mostly safe from disease transmission from other people.

Food delivery is a courier service in which restaurant or third part application of food delivery toward the mobile applications (Viktor, 2021). Customers were prohibited from eating in stores after the pandemic of Covid-19 a year ago. It is to prevent customers from congregating in a confined space. It is difficult for them to get food. Customers can order food through the application based on their preferences. This application provides a list of restaurants in a specific area. This study aimed at the customer satisfaction level towards using food delivery applications during covid-19. The relationship between convenience, time-saving, perceived value, and customer satisfaction towards food delivery applications during Covid-19. There were two objectives of this research:

1. To measure customer satisfaction towards using food delivery applications during Covid-19.

2. To identify the relationship between food delivery application attributes and customer satisfaction towards using food delivery applications during Covid-19.

    i.   To identify the relationship between convenience and customer satisfaction towards using food delivery applications during Covid-19.

    ii.   To identify the relationship between time-saving and customer satisfaction towards using food delivery applications during Covid-19.

    iii.   To identify the relationship between perceived value and customer satisfaction towards using food delivery applications during Covid-19.

SIGNIFICANCE OF STUDY

In this study, there are several stakeholders who will get the benefit as follows:

Restaurant Operator

All restaurants are allowed to reopen during the Covid-19 pandemic. However, orders must be placed as takeout. To reduce disease risk, every restaurant operator should have essential health information. The restaurant owner must develop innovative online marketing methods. By improving their restaurant website or online food ordering application can be a strategy to get more sales. Therefore, it can improve their service to open the restaurant during the pandemic and enhance their relationship with the food rider.

Food Rider

A food rider is someone who works to take orders through a food delivery app. Nowadays, customers always use a food delivery app to place an order, so the food rider acts as a middleman between the restaurant and the customer. Rider service is fast and on time because they chase customer orders. Service from the rider is very fast and on time because they chase orders from the customer. The more food order received, the higher the profit they earned.

Customer in Food and Beverages Outlet

Customers who do not want to go out will use a food delivery app to place an order. There are numerous advantages to using the food delivery application, such as time savings. Customers do not need to waste time going to the restaurant. During this pandemic, it is preferable to use a food delivery applications where the customer simply waits for the food rider to send their order. This makes it easier for customers to purchase food online, while food riders profit more from customer orders, and the restaurant surroundings are less crowded, reducing the risk of Covid-19.

LITERATURE REVIEW

Food Delivery Applications in Malaysia

Mobile food delivery applications (MFDAs) refer to smartphone-based applications used to contact restaurants, search for foods, order food for delivery, and provide payments without physical interaction with restaurant personnel (Alom et al., 2019). Online food delivery services (OFD) are trending in electronic commerce. But at the same time, according to Alalwan (2020), online food ordering applications consist of various innovative characteristics that help both customers and restaurants override problems like long waiting times, traffic, miscommunication, delayed delivery, or dealing with customer complaints.

The Mobile Food Delivery Applications (MFDAs) seem to have been a blessing for many people during the COVID-19 pandemic (Al Amin et al., 2021). It can be said that because of COVID-19 pandemic, the market demand for online food delivery applications has increased. Due to pandemic Covid-19, many places need to follow the movement control order (MCO), including the restaurant and Café. People cannot go out without specific reasons, and to avoid being infected with a virus, the consumer can use the online food application to make

an order if they want to buy something. Due to the mandate to stay at home or prefer to stay at home, food delivery services are the preferred means of purchasing foods (Marcellus, 2020). Nonetheless, given that food sold through online food delivery services is primarily prepared in existing food outlet facilities, it may have a similar nutrient profile to food prepared away from home ordered in conventional ways.

Attribute of Food Delivery Applications

An attribute of food delivery applications in this study is the convenience of the customer when using an application, time-saving to customer, and perceived value makes customer using food delivery applications. Convenience is a vital service attribute that positively impacts consumer satisfaction and behavioural response in electronic banking and online shopping (Kok, Wee & Kim, 2021). Food delivery service application gives convenience when it is easy for customers to use and user friendly. Perceived value also can make people choose a food delivery application. Besides that, in terms of attribute importance, food delivery application users are likely to pay attention to food riders, reviews and time-saving dimensions (Fakfare, 2021). According to Chai and Yat (2019) time-saving factor would be an essential element in motivating customers to use the OFD services.

Convenience

High technology gives people more convenience, like a mobile phone can be used for many functions for connecting with others. Mobile phones can also be used for online services like food delivery online in applications. It shows a growing technology gives more convenience to the user. According to Yeo, Goh and Rezaei (2017), convenience is the amount of effort one must make to be able to use a new system or technology. People will choose something with less effort and easy to do, and they will try to avoid something complicated like in a COVID-19 pandemic; people prefer to use online food delivery because they want to avoid going out to the risky place.

Moreover, convenience can be viewed in terms of accessibility of use, ease of payment methods, variety of food and restaurants, delivery schedule and time, customer service, etc. (Norshita & Khairul, 2020). The online food ordering system will set up an online food menu with the support of intelligent mobile applications and deliver the expected food items to the user's doorway. An easy use and make people prefer to use an online delivery service. It is easy because the customer can make an order at any time or at any place when using a food delivery online. The customer does not need to go to the restaurant to make an order and payment. With just a click and via a cashless payment system, food will be ready quickly, providing consumers with a great deal of convenience (Tan, Lim & Yeo, 2021).

Time Saving

One of the factors is online delivery can save time. Customer can save time by not going and back from the restaurant because they can avoid heavy traffic and avoid queuing to buy food. When an increase in Covid-19 cases in Malaysia government gives an order to the restaurant that cannot allow a customer to eat at a restaurant and only can use a takeaway service. When the consumer can save time, their perception turns positive, and as a result, their attitude toward OFDS also becomes favourable (Tan, Lim & Yeo, 2021). It shows when a customer uses an online food delivery application to save time.

Many customers choose the online delivery application to help save their time, especially busy people like office workers and students. They do not have more time to go out to buy food because work from home and online classes make them chase time. Consumers will have perceptions that the more an application can save their time or be used as quickly as possible (Hooi, Leong & Yee, 2021).

Perceived Value

Perceived value refers to the consumer's assessment of the benefits versus the costs when shopping online. Consumers who wish to shop online will prefer a vendor who offers them the

most value and benefits (Shah et al., 2019). The term perceived value is a relative comparison between benefits and sacrifices associated with the product or service offering. The perceived value's importance in online business is because customers can easily compare product features and prices (Suhartanto et al., 2019).

Mobile applications might fit the customer need and preferences and bring the positive side to customers who purchased food using an online application. Customers will feel that perceived value will satisfy their needs when they purchased an online food delivery. This is because the delivery person will give their best service while sending the food item to the customer, and the item will safely arrive to them as a guarantee.

Customer Satisfaction towards Usage of Food Delivery Applications

Customer satisfaction of home delivery service depends on the service quality of the delivery personnel, the perceived value of the service and customers' trust in the service (Hossain et al., 2021). It could also be argued that customers are more likely to be affected by those around them when judging their experience (satisfaction or dissatisfaction) of using MFOAs.

Online food delivery services have an essential and significant role in customers' experience. To achieve maximum customer satisfaction, the service providers need to focus on the quality of service and the definitive goal of food delivery services should have maximum customer satisfaction and not just a profit (Nicolaides, 2008). The service provided in food delivery applications must concentrate on the quality and the primary purpose of food delivery service to achieve customer satisfaction because they not only focus on the profit but on the many aspects to achieve the satisfaction among the customers.

Research Hypotheses

The literature review highlighted the independent variables like convenience, time-saving and perceived value of customer satisfaction towards usage of food delivery applications: Malaysia outlook. Based on the literature discussed, the hypothesis of this study was summarized in the following manner:

H_1	:	There is a relationship between convenience and customer satisfaction towards using food delivery applications during Covid-19.
H_2	:	There is a relationship between time-saving and customer satisfaction towards usage of food delivery applications during Covid-19.
H_3	:	There is a relationship between perceived value and customer satisfaction towards using food delivery applications during Covid-19.

Research Framework

Figure 1 below shows the research framework for this study.

Figure 16: Research Framework

METHODOLOGY

Research Design

This study used the quantitative approach, where questionnaires were distributed. A quantitative approach is a study that uses a statistical method to collect quantitative data in the research study. The advantages of quantitative research are collecting reliable and accurate, quick data collection and big scope of data analysis. Quantitative using a sampling method, online survey, online polls, and questionnaires to collect the data. In this study, the researcher used a questionnaire for the data method. The sample was chosen from adult people in Malaysia that use the food delivery application. The questionnaire will have a section A, section B, section C and section D. The questions were multiple choice and respondents needed to choose 1 from 4 answers in the questionnaire. Besides, the questionnaire will be on a scale in which a respondent can choose either strongly disagree, disagree, neutral, agree or strongly agree.

Data Collection

The data collection was conducted using questionnaires. This study chose to distribute the questionnaires using the Google form application. The link to the Google form was distributed to all Customers through the online methods to all students, families and every individual who is a user of online food delivery services through Instagram, Facebook, WhatsApp, E-mail and others. It was very convenient to minimize cost, save time and significantly applicable during this global pandemic outbreak. In this research, the researcher will use primary data where the researcher is the first user. Primary data is the new data collected explicitly in a research based on the questionnaire. The data collection method that using in this research is the quantitative data Questionnaire the tools that were used in this research through the google form that were created by the researcher based on the title of the research. This questionnaire was created to collect some information that is important regarding the convenience, time-saving and perceived value that was attributed to customer satisfaction toward the usage of food delivery applications during Covid-19 in the Malaysian outlook. This questionnaire was distributed through the online methods to all students, families and every individual who is a user of online food delivery services because this research is among studies for Malaysian Outlook.

Sampling

The sample size is an essential part of a study because it can help researchers to obtain reliable data. The sample sizes used in research studies were 30 to 500 of the most suitable types (Rosceo, 1975). Whereas Krejcie and Morgan (1970) approached by using a table sample size formula to shorten the process of determining the sample size for a finite population. The formula is shown below:

$$s = \frac{x^2 Np(1\text{-}P)}{e^2(N\text{-}1) + x^2 p(1\text{-}p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as proportion (0.05)
$x2$ = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

N	S	N	S	N	S
10	10	220	140	1200	291
15	14	230	144	1300	297

Data Analysis

Data analysis is the essential component of research. Data analysis is rearranging, modifying, inspecting and data transformation. Analyse data analysis is a method for changing data into different information to make data quality more understandable and valuable to solve the problem, especially for those who do research. Data Analysis will be obtained through primary and secondary data methods. The Statistical Package for Social Sciences (SPSS) system analyses the result of the questionnaire. SPSS is a program-based window that can be used to create tables and pie charts for data entry and analysis. The advantages of using SPSS include the ability to better analyze and comprehend your data and the ability to solve complicated business and examination challenges using a user-friendly interface.

FINDINGS

Table 2 below shows the frequency analysis for this study.

Frequency Analysis

Characteristic	Frequency	Percentage
Gender		
Male	123	32.0
Female	261	68.0
Age		
18-20 years old	48	12.5
21-30 years old	276	17.9
31-40 years old	51	13.3
41 years old and above	9	2.3
Material Status		
Single	308	80.2
Married	74	19.3

Other	2	5
Race		
Malay	326	87.5
Chinese	23	6.0
Indian	21	5.5
Other	4	1.0
Education level		
PhD	5	1.3
Master	20	5.2
Degree	212	55.2
Diploma	104	27.1
Other	43	11.2
How frequent do you use food delivery service in a week?		
1-3 times	193	50.3
More than 3 times	131	34.1
Not at all	55	14.3
Do not know how to use the application	5	1.3
Which food delivery applications do you always use to order the food when making the online ordering?		
Foodpanda	203	52.9
Garbfood	92	24.0
Delivery food	20	5.2
Shopee food	24	6.3
Others	45	11.7
How do you know about this food delivery application?		
Friend	128	33.3
Family	85	22.1
Social media	171	44.5

Descriptive Analysis

Variable	Items	Mean score	Standard Deviation
Convenience	Using food delivery applications would be convenient for me due to Covid-19 pandemic.	**4.45**	**0.680**

	Using food delivery applications would help me in deciding on the appropriate food selection.	**4.24**	**0.813**
	The food delivery applications are easy to make a choice and making a new order.	**4.31**	**0.779**
	By using the food delivery applications, it can help my daily routine.	**4.33**	**0.799**
Time Saving	By using the food delivery applications would allow me to order food anytime.	**4.43**	**0.730**
	By using food delivery applications can save time from saving a traffic jammed.	**4.47**	**0.692**
	When using a food delivery service application, I can have more time to do other work.	**4.48**	**0.646**
Perceived Value	I use food delivery applications because it has a display appearance this is very attractive.	**4.20**	**0.846**
	The price that was shown in the applications influence the customer to buy that food from online purchase.	**4.27**	**0.852**
	I use the food delivery applications because of the design is comfortable and easy to use through mobile application to order or buy a food.	**4.30**	**0.808**
	I use the food delivery applications based on the customer feedback that give the best review before using it.	**4.27**	**0.785**
	I use the food delivery applications because the online food order will get the priority from the restaurant.	**4.17**	**0.855**
	By using the food delivery applications, it will give me more benefits through it.	**4.31**	**0.771**

Reliability Analysis

Variable	Number Of Items	Cronbach Alpha
Convenience	**4**	**0.687**
Time Saving	**3**	**0.671**
Perceived Value	**6**	**0.817**
Customer satisfaction toward usage of food delivery application during Covid-19	**6**	**0.812**

Pearson Correlation Analysis

The timetable below shows the Pearson Correlation Analysis:

Hypothesis	Correlation Coefficient (r)	P-Value	Result (Supported or Not Supported)
H1: There is a relationship between convenience and customer satisfaction towards usage of food delivery applications during Covid-19. **H1o**: There is no relationship between convenience and customer satisfaction towards usage of food delivery applications during Covid-19.	0.655	0.01	Supported
H2: There is a relationship between time saving and customer satisfaction towards usage of food delivery applications during Covid-19. **H2o**: There is no relationship between time saving and customer satisfaction towards usage of food delivery applications during Covid-19.	0.522	0.01	Supported
H3: There is a relationship between perceived value and customer satisfaction towards usage of food delivery applications during Covid-19. **H3o**: There is no relationship between perceived value and customer satisfaction towards usage of food delivery applications during Covid-19.	0.684	0.001	Supported

DISCUSSION AND RECOMMENDATION

Discussions are aimed at solving hypotheses, as mentioned in the first chapter of this study. In general, this study discovered customer satisfaction towards using food delivery applications during Covid-19 in Malaysia outlook. The study is conducted based on the quantitative design where the questionnaire was distributed to 384 respondents to investigate customer satisfaction towards usage of food delivery applications during Covid-19.
The questionnaire was given through google.

Online food delivery service is more convenient and user-friendly than the traditional system because orders placed by customers can be easily viewed and recorded through mobile applications or websites (Hooi, Leong & Yee, (2021). According to Tan, Lim and Yeo (2021), consumers are eager to use OFDS because they can save significant time from menu selection to preparation. Online food delivery service providers must fully understand how the customer perceives this online service, and such understanding requires measuring the OFD service quality according to Yusra and Agus (2020).

The highest value of mean for customer satisfaction toward the usage of food delivery applications during Covid-19. If viewed from an angle independent variable, most of the respondents agreed that the perceived value shows the mean score (3.556); is the highest value for customer satisfaction toward the usage of food delivery applications during Covid-19. This answers the question of the impact of perceived value on usage of food delivery applications during Covid-19. The lowest mean value is time saving, which shows a mean score (1.608). Respondents slightly disagree that time saving is the main factor that will affect customer satisfaction toward the usage of food delivery applications during Covid-19. The hypothesis was analysed to explain the relationship between convenience, time-saving and perceived value towards customer satisfaction toward the usage of food delivery applications during Covid-19.

The recommendation of the study is faster and more effective food preparation when traders have time to prepare or dedicate such preparation. This helps both parties to save time in food delivery. Preparing these foods in times of pandemic is a much better thing. And the way to use food delivery is significant to the elderly. From research studies, some elderly people are less skilled in food delivery. The elderly mostly under-used devices because they do not understand the latest technological systems. When teaching them, they will better understand the consumption

CONCLUSION

In conclusion, this study discovers Customer Satisfaction towards using Food Delivery Applications during Covid-19 in Malaysia. Three independent variables, convenience, time saving and perceived value, have been chosen to examine the relationship with the dependent variable, customer satisfaction towards usage of food delivery application during Covid-19. The data was taken from 384 respondents in the google form. The respondent from the variation of the race like Malay, Chinese, Indian and others. The age was used from 18 years old and above to be a respondent in this study. The convenience score from the Pearson Correlation value is *0.001, followed by time-saving with a score of *0.533, and perceived value with a score of *0.684.

ABSTRACT

This study examines the customer perception towards Artificial Intelligence in Malaysia Hospitality Industry. The study focuses on hotels, so that the Artificial Intelligent becomes integrated with CRM solutions, facilitating the hotels and the customers to gather information from a single source. Customers fail to understand the concept of automated procedures in other hospitality industry sectors, such as restaurants, due to a lack of exposure to highly automated systems. One of the most significant issues is that many hospitality consumers still do not realize artificial intelligence and how it can affect the industry's future. Adult customers are more open to using technology and expect technology to be involved in at least one aspect of each service provided in the last example. However, most customers expect hotel services to be provided by staff, lacking knowledge of how technology can function as a personal caregiver.

Keyword: Artificial Intelligence, Hospitality Industry, Technology, Customers

INTRODUCTION

Artificial Intelligence (AI) is a technology that augments human intelligence via computer science and machine learning. Early AI researchers and academics focused on how to programme human experiences to solve problems. Recently, empirical data obtained from big data was used to develop a collection of algorithms capable of coping with more complex and service-oriented difficulties on their own. These techniques are becoming more widespread in the real-world commercial context as the amount of data that can be learned expands and the technology that can manage it improves. Many areas, such as banking, logistics, and education, have only recently begun aggressively employing AI for service.

Artificial Intelligence in the hospitality industry has the potential to change everything from tourist trip design to discovery, selection, reservation, and tourism experience. Typical services include chatbots, robots, travel aides, product suggestions, prediction algorithms and service personalization. Besides hotels, restaurants, events, and travel agencies are embracing and integrating technologies such as service automation and robotics, beginning with kiosks.

In the hotel sector, Artificial Intelligence is employed for revenue management, guest experience, and the automation of daily operations. To apply AI in hotels, management must assess where their investment will have the most considerable impact depending on available budget, guest feedback, and future expansion goals, as new technologies enter the market virtually every day.

Because of its ability to execute traditionally human functions at any time of day, Artificial Intelligence is becoming increasingly important in hotel management. This can save hotel owners a lot of money while also reducing human error and providing better service. Customer service, in particular, is an essential component of the travel industry, with hotels routinely thriving and dying based on how well they treat their customers. The possibilities for improving this aspect using Artificial Intelligence are practically unlimited, ranging from enhanced personalisation to personalised recommendations. One of the most demanding customer service challenges for hotels is responding to client concerns quickly and Artificial Intelligence now presents an additional alternative for tackling this issue. Furthermore, it may

help with tasks such as data processing and, by gathering data, can effectively "learn" and adapt to customer interactions. There are research objectives of this research:

1. To measure the customer perception towards artificial intelligence in the Malaysian hospitality industry.

2. To identify the factors influencing customer perception towards artificial intelligence in the Malaysian hospitality industry.

i. To identify the relationship between ease of use and customer perception towards artificial intelligence in the Malaysian hospitality industry.

ii. To identify the relationship between usefulness and customer perception of artificial intelligence in the Malaysian hospitality industry.

iii. To identify the relationship between innovativeness and customer perception towards artificial intelligence in the Malaysian hospitality industry.

iv. To identify the relationship between readiness to change and customer perception towards artificial intelligence in the Malaysian hospitality industry.

Significance of the Study

In-person customer service
The development of Artificial Intelligence (AI) to give personalized service is an example of Artificial Intelligence (AI) technology in the hotel business. Researchers already see the creation of robots with artificial intelligence, and the technology's potential for advancement is vast and complex. It is capable of dealing with the most common client problems. The finest example is Hilton's adoption of an AI robot named 'Connie.' Customers who engage with either robotic can get services for tourists from it. Its ability to learn from human speech and adapt to people is particularly astounding. In the end, the worse the clients who communicate with him, the better (Refvine, 2021).

Chatbots and messaging
Employees and consumers, as in the hotel industry, may leverage Artificial Intelligence (AI) technology for forward customer service, which might be the most apparent application. This technology has proven to be particularly useful for direct messaging and online chat services, which may be used to answer simple queries or requests. In social networks, such instance, artificial robots were developed to enable users to ask questions and receive replies virtually quickly, 24 hours a day, seven days a week. This is highly beneficial to the hotel since it allows for reaction times that are nearly difficult to achieve with human-to-human engagement (Refvine, 2021).

Online reputation management
The hotel sector thrives on its good name. They give information on how customers feel about the brand. Hotels may now use Classification Techniques or AI to assess online comments from varied clients across several social media platforms and other review sites. Positive feedback will improve the brand's image, while negative feedback will give a chance to better serve the client (Qualetics Team, 2020).

Hotel operator
Inside the hotel industry, hotel operators deploy service robots. Technology has disrupted practically all sectors worldwide as it becomes more sophisticated. The hotel business is one of the sectors where technological advancements have positively influenced how the industry runs and performs today. Countless hoteliers are increasingly relying on one specific tool in their establishments to improve personalization and exceed customer expectations; computer vision (artificially intelligent) is a term used to describe artificial intelligence (Alom et al., 2019). As a result, hotel executives must think about where and how robotization might be used to strike a balance between operational efficiency and consumer expectations. To gain benefits of the

robot revolution, moral management is needed (Stienmetz, 2020). The findings highlight the management and marketing tactics employed to provide cutting-edge automated services. They also give an up-to-date understanding of the many functions that robotic technology plays in hospitality service interactions.

Customer in hospitality industry

AI has influenced the hotel industry via the use of big data, in addition to increasing customer support using robots or personal robots. The information gathered from visitor spending is then used to analyze each guest's specific attributes and habits to customize more information to their preferences. Casino Entertainment's Total Rewards Loyalty Program not just reinforces customers' satisfaction, but also establishes itself as a great customer service of the ability to gather, transform such as the information into customer observational data, then use those findings achieve a customer satisfaction completely unique. Hotel owners should start controlling the equilibrium among both human and Artificial Intelligence (AI), especially hotels such as Alibaba's FlyZoo Hotel based on Artificial Intelligence robotics with machine learning based technologies (Zhou, 2019).

Besides, reducing human error is a human error that occurs as a result of making mistakes. However, if a computer is built efficiently, this would lessen the likelihood of making mistakes. Findings could be obtained through earlier data by applying Artificial Intelligence Technology and a particular set of algorithms (Pew Research Center, 2018). As a result, errors are lowered, and the possibility of reaching accuracy with a greater degree of precision is increased. For instance, they have decreased the complexity of human uncertainty for weather forecasting by implementing Artificial Intelligence Technology (AI). Second, digital assistance is that some sophisticated firms employ digital assistants to engage with people, reducing the need for human resources. Many websites utilise digital assistants to deliver consumers' services. For instance, suppose the company does have a customer service staff that is also responsible for answering client questions and concerns. Corporations may use AI to create Voice bots or Virtual assistants that could also assist customers with all of their questions (Schwab, 2016). Many firms have already begun to use it on their websites and mobile applications.

Future researcher

This research can be used as a resource for future scholars. This idea might be the second tool that leverages various sorts of techniques throughout the hospitality industry, and the strong need for robotics technology exists. Investigators must learn, investigate, and have a deeper understanding of organizational robotics which will improve in hotel industry (Pew Research Center, 2018). Future researchers can use this study to compare to other research to see whether there is a difference in visitor perception of robotics technology in the hotel business (Ivanov et al., 2019).

LITERATURE REVIEW

Definition

Artificial Intelligence (AI) is a technology that augments human intelligence via computer science and machine learning. Early AI researchers and academics focused on how to programme human experiences to solve problems. Artificial Intelligence in the hospitality industry has the potential to change everything from tourist trip design to discovery, selection, reservation, and tourism experience. In the hotel sector, Artificial Intelligence is employed for revenue management, guest experience, and the automation of daily operations. Typical services include chatbots, service robots, travel aides, product suggestions, prediction algorithms and service personalization. Apart fromBesides hotels, restaurants, events, and travel agencies are embracing and integrating technologies such as service automation and robotics, beginning with kiosks. To apply AI in hotels, management must assess where their

investment will have the most significant impact depending on available budget, guest feedback, and future expansion goals, as new technologies enter the market virtually every day.

Customer Perception

Artificial Intelligence is one of the most brilliant ideas that has transformed a variety of sectors all over the world. The development of computer systems that can execute jobs and activities that need human intelligence (Russell & Norvig, 2016) is known as artificial intelligence (AI). In fact, existing smart technologies can be adapted to new technologies to simplify existing customers' lives. For example, knowledge-based or case-based reasoning can help robots create recommendation systems by providing technological support. The emergence of intelligent humanoid robots can bring new prospects to the industry. Furthermore, utilising new technology allows businesses to adapt to changing circumstances and increase their competitiveness (Kim, Jang (2016).

Humanoid intelligent robots that can replace human services can increase service quality by using technology to deal with enormous data that people cannot handle. Because the development of humanoid robots has reduced the need for managers, the exploration of appropriate technical tools has become a key problem. Furthermore, due to the global population's ageing, several countries and areas are experiencing a labour shortage.

Ease of Use

In a study conducted by Bowen and Morosan (2018), most robotics and AI tools have been created for business usage. However, various systems based on robotics and AI have been employed by customers to help them make better economic decisions and engage in a seamless hospitality experience examples are shopping assistants, chatbots, etc., over the last 10–15 years. Some have physical manifestations (robots), while others may be AI-enabled software programmes on their personal computer. Similar approaches are likely to emerge in the future, as consumers will have intelligent agents at their disposal who can make decisions for them. Apps, for example, can synchronise consumers' calendars, send reminders, make payments, and eventually learn guests' travel routines to better respond to the variety of sub-decisions that are inherent in hospitality; these sub-decisions are integral to newer, interactive approaches to services that are designed using service-dominant logic principles (Zhang et al., 2018).

Furthermore, users' own hardware and software will be integrated, resulting in an environment characterised by continuous human-machine interaction and learning. By 2030, a growing number of travel products will be reserved and purchased by machines representing both the traveller and the travel industry company, without human involvement. Machines and AI software representing the guest and the hospitality firm will cocreate the trip offering; both systems will comprehend their clients' demands.

Usefulness

Artificial intelligence is intelligent performance generated through robots' services to help facilitate human work management. Artificial Intelligence is also defined in various ways, however, it generally refers to machines and robotics. Its usefulness is to achieve goals, assist human tasks, and improve and enhance the operational efficiency of an organization. The usefulness of these robot services are of various types and brands of robots; among them is Chatbot which is powerful to help customers get more information, room service, order a taxi, and Chatbot is also used to help customers check in and check out. In addition, the Chatbot service is also used to carry customers' luggage to the room, is used to greet guests and can greet in multiple languages. It is also used in large restaurants to order and deliver food. The usefulness of this Chatbot service is quite popular in the hospitality industry.

Meanwhile, the Concierge robot can be used to help customers check-in and manage customer questions. The Concierge robot is also voice-activated with a calling card to make it easier for

customers to interact with it. Next, Savioke's Relay robots are used to perform the task of delivering food to the guest room. This Relay robot is equipped with cameras and sensors that can identify room numbers, move in crowded spaces and ride elevators without colliding with anything and anyone. The usefulness of these robotic services in the hospitality industry not only simplifies customer affairs but also eases hospitality workers' tasks.

Innovativeness

Innovativeness is defined as the aptitude and imagination to create new things, which speaks to the dual nature of the quality but only scratches the surface of its significance to corporate growth and sustainability. Among the hotel's innovations is the deployment of AI chatbots on social media channels, allowing clients to ask inquiries and receive near-instantaneous responses 24 hours a day, seven days a week. This is crucial to the hotel because it delivers a level of response time that is nearly hard to achieve through human-to-human connection.

Readiness to Change

The tourism and hospitality sector, by its very nature, is human-centred and service-oriented. As a result, it strives to guarantee that consumers have good opinions of the quality of services that firms supply in this industry, resulting in customer satisfaction and loyalty. Although they will be likely to replace people totally, robotic systems will become well-known in the hotel industry, and the employment of artificial intelligence applications in these fields may attract tourists. However, when this cutting-edge technology gets more widely used in practically every area in the future, some tourist and hospitality industry stakeholders may reject it. Although artificial intelligence and robotic technologies have both beneficial and bad consequences, they continue to clash with the quality of service in the hospitality industry.

The purpose or resolve of an internal stakeholder to make a committed change is referred to as readiness to change. A conviction in a group's collective power to affect change and that the consequences of such implementation are more successful is also referred to as readiness to change. The suggested definitions for artificial intelligence lead to the conclusion that this technology is a sub-discipline of computer engineering (Tussyadiah, 2020). Artificial intelligence is a branch of computer science investigating how robots can think for themselves. Artificial intelligence (AI) is a computer-based system that can solve problems, store information in memory, and interpret human language (Wang, 2004). It is also defined as a system's capacity to properly understand the external data, learn from it, and use what is learned to fulfil specific objectives and tasks through flexible adaptation (Kaplan & Haenlein, 2019). Artificially intelligent definitions are often separated into four categories: thinking humanly, reasoning, acting humanly, or behaving properly (Russell & Norvig, 2016). Natural language processing (for accessible communication), knowledge representation (to store what it knows or hears in memory), automated reasoning (to use the information stored to answer questions and obtain new results), machine learning (to adapt and predict new conditions), computer vision (to detect objects), and robotics (to move artefacts amongst itself) are six characteristics that computers must have had to act humane treatment (Russell & Norvig, 2016).

Research Hypothesis

In this study, there are four major hypotheses that will be tested:

1st Hypothesis

H_0	There is a relationship between ease of use and customer perception towards artificial intelligence in Malaysia hospitality industry.
H_1	There is no relationship between ease of use and customer perception towards artificial intelligence in Malaysia hospitality industry.

2nd Hypothesis

H$_0$	There is a relationship between usefulness and customer perception towards artificial intelligence in Malaysia hospitality industry.
H$_2$	There is no relationship between usefulness and customer perception towards artificial intelligence in Malaysia hospitality industry.

3rd Hypothesis

H$_0$	There is a relationship between innovativeness and customer perception towards artificial intelligence in Malaysia hospitality industry
H$_3$	There is no relationship between innovativeness and customer perception towards artificial intelligence in Malaysia hospitality industry.

4rd Hypothesis

H$_0$	There is a relationship between readiness to change and customer perception towards artificial intelligence in Malaysia hospitality industry.
H$_4$	There is no relationship between readiness to change and customer perception towards artificial intelligence in Malaysia hospitality industry.

Research Framework

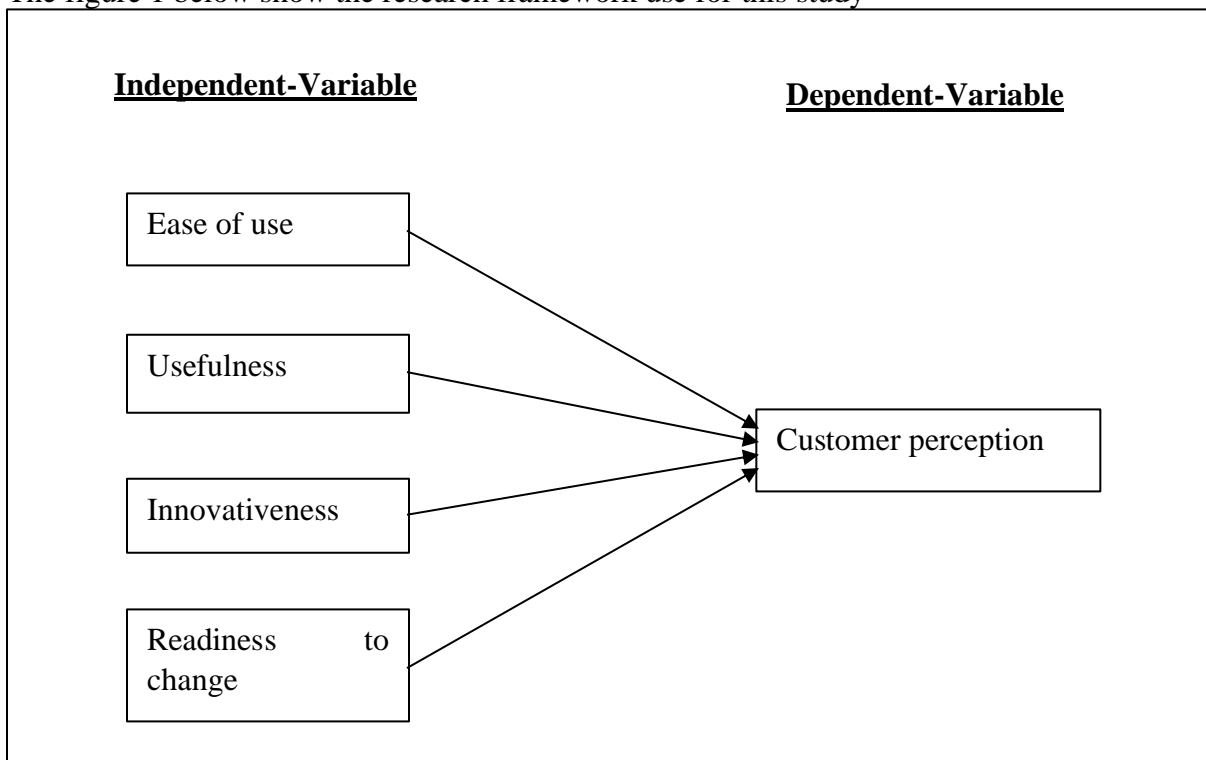
The figure 1 below show the research framework use for this study


Figure 1: Research Framework

METHODOLOGY

Research Design

The researcher decided on the particular data collection and analysis methodology and procedures needed in this section. As a result, it must be described as a framework for this research since it answers the research topic. This study will be done by using the descriptive research method as the way to get all information. This study will have survey research to obtain the related data. The questionnaire will use as the main instrument to get the variables' information from the respondents. All the data obtained from the respondents will be used as the main information in this study. In this study, the researcher will use quantitative research

by using the descriptive research method as the way to get the data. To obtain the related data, this study will use survey research.

Quantitative approaches focus on objective measurements and statistics, mathematics, or numeric analysis of the data acquired through polls, questionnaires, and surveys, as well as modifying pre-existing statistical data using computing techniques. Quantitative research is concerned with collecting numerical data and generalising it across groups of individuals or explaining a phenomenon.

The benefits of quantitative research are typically applied to systematic data collection and interpretation of the findings of the studies. Because of the consistent data collecting technique and the significant descriptions of abstract ideas, the study may be repeated. Respondents in qualitative research are not asked questions with predetermined answers. Rather, it empowers people to just be individuals by allowing students to express their thoughts and opinions without any restrictions openly. As a result, the likelihood of getting genuine responses is considerable in this study, instead of answering who, what, and when inquiries, qualitative research is frequently intended to address how and 'why' questions. It is more keep to understand why persons behave in the way they do than to calculate their numbers.

Data Collection

Questionnaires will be distributed to respondents online. This questionnaire will be created using google Forms, and the google form link will be distributed using social media such as WhatsApp, Facebook and so on to all respondents. This questionnaire also will be distributed to respondents aged 18 years and above. That way, it can avoid prevent the respondent from answering all the questions in a hurry. This is because the respondent can take the suitable time before answering all the questions provided. Therefore, the data collection can be done easily and quickly.

Pilot study

The pilot study will be intended to evaluate the feasibility of the proposed significant study. The researcher will use members of the public aged 18 and above as respondents. Therefore, the pilot study will help to confirm full-scale implementation. This pilot study will also be very effective in the feasibility and validity of the computational tool. Researchers also used Cronbach's alpha to determine the accuracy of the questionnaire.

Sampling

The sampling method is the procedure of selecting a good base amount from a population. There are two sampling processes which are probability sampling and non-probability sampling. In this study, the researcher chose non-probability sampling; this is because the sample selection was based on the researcher's subjectivity and not from a random sample. This non-probability sampling method involves the selection of a sample from an identified population based on predefined criteria. There are four types of non-probability sampling: convenience sampling, voluntary response sampling, purposive sampling and snowball sampling.

In this study, the researcher will use the convenience sampling method to facilitate data collection. This convenience sampling is based on element availability and ease of obtaining it. The advantages of using this convenience sampling is that this method is quick and easy. The researcher is also independent in determining samples and producing accurate data.

Data Analysis

Data analysis is defined as the process of organizing, summarizing, representing, assessing, and interpreting data using statistical methods to summarise the gathered information is known as data analysis. First and foremost, when conducting the analysis, it is vital to clearly understand the research's aim. It is a review of data or information obtained from respondents to create relevant records. The information can be used in studies, surveys, and other applications. The researcher will employ the quantitative method. The most frequent way to analyse quantitative

data is descriptive analysis, emphasising demographic and financial facts. In addition, inferential analysis is focused on examining and comparing the relationship between the independent and dependent variables in this study.

FINDINGS

Result of Frequency Analysis

Table 1: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	73	28.5%
Female	183	71.5%
Age		
18-30 Years Old	188	73.4%
31-40 Years Old	26	10.2%
41-50 Years Old	24	9.4%
51 Years Old and Above	18	7%
Race		
Malay	220	85.9%
Chinese	15	5.9%
India	13	5.1%
Other: Asli	8	3.1%
Education Level		
STPM	51	19.9%
Diploma	42	16.4%
Bachelor Degree	156	60.9%
Master or PHD	7	2.7%
Income Level		
RM1,000-2,000	169	66%
RM2,001-RM3,000	37	14.5%
RM3,001-RM4,000	23	9%
RM4,001-RM5,000	15	5.9%
RM5,001 and Above	12	4.7%

Table 1 shows the result of frequency analysis which consists of gender, age, race, education level and income level.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Item	Mean Score	Standard Deviation
Ease Of Use	Enterprises that plan and implement the effective use of robotics and AI in their service delivery systems will have a competitive advantage.	4.2578	0.63550

	Robots can learn natural employee privileges, which results in changes in work efficiency during the workday.	4.1445	0.81566
	The capabilities and use of information in a well-managed customer relationship management system is so vast that AI is applied to software applications.	4.1758	0.70597
	Robots that respond to voice commands but can read the user's face to measure a wide range of emotional responses are likely to be seen.	4.0625	0.81409
	It is important for hospitality organizations to understand their customers and the way they will or will not interact with robots as they head toward robotics.	4.1211	0.71742
Usefulness	Robot services can help the consumer such as introducing the hotel or restaurants.	4.4297	0.65300
	The usefulness of robot in the hospitality industry helps customers get more information related to hotels or restaurants.	4.3711	0.70779
	Robot services in the hospitality industry can help ease the task of hotel and restaurant employees	4.3906	0.69434
	The usefulness of robot services helps	4.4102	0.69715

	hotels or restaurants become more productive.		
	The usefulness of robot services in the hospitality industry can provide satisfaction to customers.	4.3750	0.66273
Innovativeness	This Artificial Intelligence (AI) technology can do personalization and profiling to understand a person as a unique individual.	4.1719	0.72609
	Prediction systems is designed to predict stock and currency exchange prices and manage inventory.	4.0898	0.80424
	A conversation system is designed to understand human speech and reply in natural language.	4.1172	0.75792
	Pattern recognition systems tries to find consistent patterns, and then understand what is normal, and what is not.	3.9961	0.75406
	Object identification systems use machine learning to recognize things in the world.	4.1602	0.70969
Readiness To Change	Artificial intelligence (AI) can change old systems based on computer technology in the hotel and restaurant industry.	4.3516	0.60183
	Customer perception of the readiness to change on AI robots can lead to high innovation.	4.3555	0.64672
	Artificial Intelligence (AI)	4.3594	0.64150

	robots could transform the hospitality and restaurant industry in the future.		
	The use of AI robots could transform cutting-edge technology into the hospitality industry.	4.3828	0.65823
	Human acceptance of AI robots can change the existing readiness in the hospitality industry.	4.3750	05.65679
Customer Perception Towards Artificial Intelligence in Malaysian Hospitality Industry	I believe intelligent humanoid robots have been used in the hospitality industry to provide employees with a human-like experience	4.1875	0.79459
	I think that the intelligent robots to the hospitality business able to better attract clients while lowering the cost-of-service employees.	4.1836	0.72591
	I feel that the introduction of new technologies can attract a huge number of potential clients and assist the service business to open up new markets.	4.2383	0.70423
	I prefer to use artificial intelligence to replace human labour and create a unique customer experience which will increase the demand for the use of robots.	4.1641	0.77992
	The robots should be designed to maintain a certain distance	4.3125	0.68313

Item description		
	from humans and that the capacity for robots to actively identify and attract clients should be considered.	

Table 2 shows the result of descriptive analysis, which consists of the independent variable of ease of use, usefulness, innovativeness, and readiness to change. The dependent variable is customer perception towards artificial intelligence in Malaysian hospitality industry.

Result of Reliability Analysis

Table 3: Reliability Analysis

Item description	N	No. of items	Reliability Cronbach's Alpha
Ease of use	256	5	0.854
Usefulness	256	5	0.883
Innovativeness	256	5	0.856
Readiness to change	256	5	0.905
Customer perception	256	5	0.845

Table 3 shows the result of reliability analysis, which consists of the independent variable of ease of use, usefulness, innovativeness, and readiness to change. The dependent variable is customer perception towards artificial intelligence in Malaysian hospitality industry. And as long as the alpha value in our questionnaire is between 0.845 and 0.905, it can be used for the analysis.

Result of Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

		iv1	IV2	IV3	IV4	DV
iv1	Pearson Correlation	1	.649**	.786**	.696**	.710**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	256	256	256	256	256
IV2	Pearson Correlation	.649**	1	.648**	.762**	.582**
	Sig. (2-tailed)	.000		.000	.000	.000
	N	256	256	256	256	256
IV3	Pearson Correlation	.786**	.648**	1	.697**	.720**
	Sig. (2-tailed)	.000	.000		.000	.000
	N	256	256	256	256	256
IV4	Pearson Correlation	.696**	.762**	.697**	1	.679**
	Sig. (2-tailed)	.000	.000	.000		.000
	N	256	256	256	256	256
DV	Pearson Correlation	.710**	.582**	.720**	.679**	1
	Sig. (2-tailed)	.000	.000	.000	.000	
	N	256	256	256	256	256

Table 4 shows that Pearson's correlation analysis was used in testing the relationship between hypotheses on a significant relationship such as ease of use, usefulness, innovativeness, and readiness to change with customer perception's relationship. The result shown all hypotheses stated were accepted at a 0.01 significant level.

DISCUSSION AND RECOMMENDATIONS

These recommendations are highlighted to improve future studies and can also help researchers make future studies more thorough. The recommendations also help researchers increase the number of respondents and facilitate data collection. The first recommendation is a method for data collection. Researchers need to use quantitative methods to collect data for the study. The second recommendation is related to the use of language in the questionnaire that will be distributed to the respondents. Researchers should use language that is easy to understand by all respondents selected to answer the survey, which consists of various races in Malaysia. The following recommendation is related to the search for respondents to answer the survey. Researchers need to find respondents who have knowledge and experience about the study conducted by the researcher. Finally, researchers need to extend the research period to obtain data the most accurate. This can also allow respondents to answer without haste and according to the appropriate time. Therefore, the researchers also can use the method of distributing questionnaires online by using google forms. This can give the respondent time to answer carefully and understandingly.

CONCLUSION

In this chapter, the research methodology is discussed in depth. This chapter begins with a detailed introduction to the analysis, followed by the study design and population from which data are obtained and the method used to collect samples. The researcher designed the basic method and procedure for collecting and analysing the necessary data. And in this research, customer perceptions of artificial intelligence in the hospitality industry were tested. According to the result, all independents variable such as ease of use, usefulness, innovativeness, and readiness to change caused influences on the dependent variable, customer satisfaction. This research also suggested the adoption of other independent variables, using local people as the respondents and the same quantitative method for data collection in future research.

Corresponding email: azimah.o@umk.edu.my

ABSTRACT

Unemployment cases among hospitality graduates throughout Malaysia cause economic, social and political harm. The number of students who have graduated has increased year by year. This study aims to determine the relationship between attitudes of graduates and the unemployment rate among hospitality industry graduates. This study was conducted in Malaysia. The total sample size for this study was 384 respondents, who were randomly selected to answer 31 questions. The results show that the dependent variable (unemployment rate among hospitality industry graduates) is influenced by independent variables (attitude of graduate, style of employment and level of interest and commitment). Overall, based on Pearson's correlation analysis, the attitude of graduates scored a value of *0.692, followed by employment style with *0.794, and level of interest and commitment with *0.422. There was a strong positive significant and weak positive significant. The findings of this study can be used as a guide for hospitality operators and academics looking to understand the problem of the unemployment rate among hospitality industry graduates in Malaysia.

INTRODUCTION

The issue at hand is one of the unemployment graduate's hospitality industry in Malaysia. Unemployment is an undesirable problem that can affect any country in the world. As long as the person is employed, they may become unemployed at some point (Razak, M.I.M., Ahmad, I. & De Mello, G. 2014). If the unemployment issue is not resolved, the contribution to the problems of the unemployed graduates, the nation, society and even the country will undoubtedly grow. Furthermore, if the nation's unemployment continues to be severed, riots and insurgency will happen across the country and uncertain the country's trading. A significant loss to the nation will arise due to this dangerous problem (Alom et al., 2019). As a result, it can be seen as a source of unemployment. According to the Malaysia Labour Force Survey, the unemployed are people who are willing to work but unable to find one in a reasonable amount of time.

This study investigates how these elements interact to influence hospitality graduates. It is also solves that problem so that they know the reason why unemployment happens. The finding shows that this study is divided into three categories: attitude of graduates, style of employment and the level of interest and commitment. The research design, population and sample size, sampling procedure, data collecting, research instruments, and data analysis were all described in this study. Validity and reliability are critical in determining if the samples collected are valid and predictable. As a result, the reliability test will be conducted using Cronbach's alpha approach. Additional analysis and exploration of the link between the variables will be conducted using Pearson's correlation test.

The first section explores and highlights the results supporting the analysis's main objective.

1. To determine the relationship between attitude graduates and the hospitality industry graduates' unemployment rate.

2. To determine the relationship between style employment and the unemployment rate among graduates in the hospitality industry.
3. To determine the relationship between the level of interest and commitment to the unemployment rate among hospitality industry graduates in Malaysia.

Researcher

This research aims to provide more precise information and address the entire existence of information to new researchers. Researchers can see that this issue is prevalent in our country. This topic is very synonymous and is a hot topic right now. The conclusions that have been studied also prove that the unemployment rate among the community, especially graduates is very high compared to others. Therefore, the researcher can see that in this study, the emphasis is on the factors that cause a very high unemployment rate and what the impact will be if this issue is not curbed quickly. The policy implications of this case have also proved that it has affected our country in a wave of extremely high unemployment. Finally, it shows that this matter can be more controlled if all play a high role in ensuring that cases and unemployment rates among university graduates can be controlled.

Authority

The further importance of this study is how to handle unemployment in Malaysia. The further importance of this study is how to address unemployment in Malaysia. This study also raises awareness about the occurrence of unemployment among graduates in Malaysia. This research will inform authorities who want to improve or address these unemployment cases. Implementing an appropriate approach for such a scenario can help graduates in a highly competitive market improve various elements such as graduate attitude, job style, level of interest and commitment. The finding shows that this study is divided into three categories: attitude of graduates, style of employment and the level of interest and commitment.

Graduates

This study is also important to graduates. Graduates are influenced by external market changes and their own personal characteristics. Graduates' attributes and unemployment have a strong relationship. Almost all the respondents strongly agreed that they were too picky about the position offered by an organization. It is because the graduates want to live in comfortably life. Furthermore, the fresh graduates are exposed to a high standard of lifestyle, and another reason is the high cost of living.

LITERATURE REVIEW

Attitude of graduates

The attitude of graduates who like to choose jobs is a factor in the unemployment problem among hospitality graduates. The attitude of an individual depends heavily upon different stimuli. This is said so because, Ajzan (1998) consider attitudes as a disputation to respond favourably or unfavourably to an object, person, institution or an event, while attitudes as a hypothetical construct used to explain the direction and persistence of human behaviour. It is said so faucet, they would rather stay at home without doing any work than work not in their field. They are also more willing to be unemployed than working as clerks or in other positions that are felt to be less equal even though they work better than being unemployed. Such thoughts need to be removed from the minds of every graduate as it not only harms them but also harms the sector that needs human resources. Graduates' attributes are the quality or skills that need to be gained by the graduates and need to be developed when they are at higher educational institutions. For graduates' attributes, the focus is channelled on two types of skill: technical and employability skills. Technical skill is an important aspect that should be mastered by graduates, as it is the core that enables them to get jobs. While employability skill refers to the quality and personal insight a graduate should have. This is to help with the graduate's marketability and to help the graduate become a competent and competitive worker.

Style employment

The style of employees is also one of the essential things and should be considered in choosing them to join us in a particular scope of work. Too many examples researcher have seen that many university graduates find it difficult to find a job due to their own attitude of choosing a job too much and not daring to try something challenging. They assume that they will continue to get the desired job with a high certificate. Graduates need to take the example of the community and seniors before venturing into any field of work. Graduates should also not be too spoiled in choosing a job and have a healthy and open mind in choosing a job. One of the factors to job vacancies in a company is the attitude of some employees who are too picky and want to get a good job. Many graduates now consider the tail of their attitude of over -choosing the scope of employment space. Yet it is undeniable that employers are also one factor making it difficult for employees to get the job they want. Employers who are too picky and picky will also cause job shortages and create a lot of unemployment among university graduates.

One factor contributing to graduate unemployment in Malaysia is the quality of graduates. Some employers in the industry make negative comments about graduates, claiming they lack the necessary skills and qualifications.

Level of interest and commitment

Graduates' attributes are the quality or skills that need to be gained by the graduates and need to be developed when they are at higher educational institutions. Qualities acquired by the graduates prepare them for their future undertakings. For graduates' attributes, the focus is channelled on two types of skill: technical and employability skills. Technical skill is an important aspect that should be mastered by graduates, as it is the core that enables them to get jobs. While employability skill refers to the quality and personal insight a graduate should have. This is to help with the graduate's marketability and to help the graduate become a competent and competitive worker. Employability and technical skills should be obtained by graduates, as those are important criteria that can help them get jobs. The study's findings revolve around the technical and employability skills among the graduates that became the factor for the unemployment issue.

Unemployment rate among hospitality industry graduates

The unemployed include persons who were available for work but did not work during a reference period. They could either be actively looking for work or not during the said period. The unemployment rates have been on the rise again, although the increase was not as high as in the mid-1980s. Malaysia experienced several years of rapid growth in the 1990s, which began to slow down at the end of the decade, and it registered its lowest growth rate in 2001. Between 2002 and 2005, the average GDP growth was 5.74%. However, changing the economic structure may cause a rise in unemployment. For many years, manufacturing had been the most substantial sector in the country and the main contributor to employment creation until the financial crisis in mid-1997. From this period onwards, the agriculture sector was progressively replaced by the manufacturing and services sector. The services sector, in particular, requires people who possess the right soft skills such as communication and interpersonal skills but acquiring graduates with those qualities has been quite tricky. First, graduates may only be trained in the right technical knowledge and not soft skills. Secondly, since the official language of Malaysia is Bahasa Malaysia and the teaching of almost all subjects in primary and secondary schools and public universities are not in English, local graduates may find it very difficult to communicate in this language when they go out into the real" world.

Research Hypothesis

The literature review highlighted that the independent variables like the attitude of graduates, style of employment, level of interest and commitment affect the unemployment rate among

hospitality industry graduates in Malaysia. Therefore, the study planned to examine 114 the level of effect among these variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1   There is a relationship between salary and the unemployment rate among hospitality graduates in Malaysia.

H2   There is a relationship between personnel development and the unemployment rate among hospitality graduates in Malaysia.

H3   There is a relationship between working atmosphere and the unemployment rate among hospitality graduates in Malaysia

Research Framework

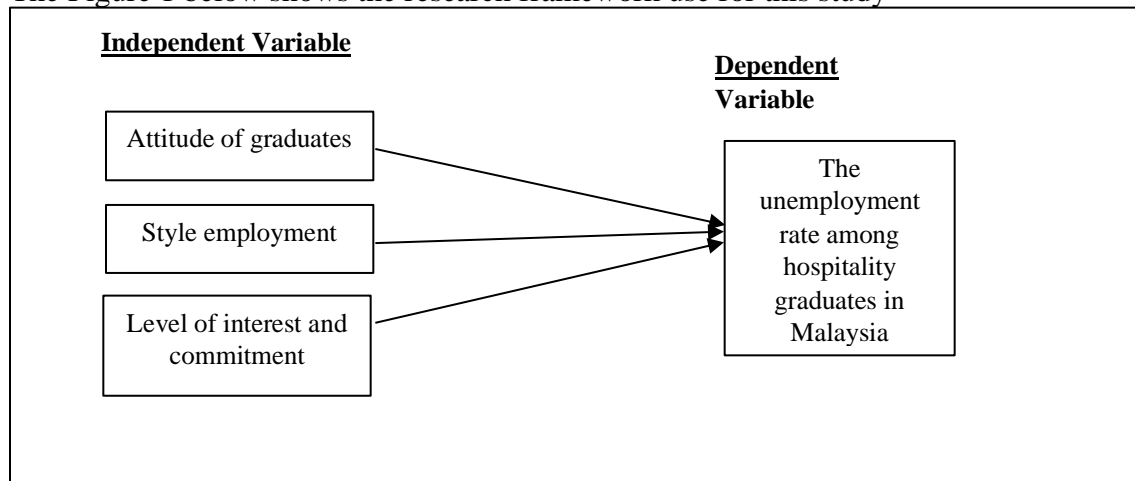
The Figure 1 below shows the research framework use for this study


Figure 1: Research Framework

METHODOLOGY

Research Design

This study uses a quantitative method in which a questionnaire was distributed to 384 unemployed respondents. In this study, the selected target population is Malaysian citizens.

In addition, a set of questionnaires were distributed to the population to collect data on unemployed graduates. This questionnaire uses a multiple-choice format and a 5 -point agreement Likert scale. The researcher divided the questionnaire into 4 parts, namely: Part A, B, and C. For Part A, the questionnaire asked for general information on the household demographics of Malaysian citizens, such as the gender, age, race, marital status, education level, and type of place of study. For Sections A, B, and C, the questions elaborate further on the dependent and independent variables, namely (i) attitude of graduates, (ii) style of employment, and (iii) Level of interest and commitment, that have been studied in the survey.

Data Collection

They were collecting and measuring information of gathering and evaluating information from various sources in order to create a complete and accurate picture of a subject. Data collection aids a person or organization answer important questions, evaluate outcomes, and forecast future probability and trends. The purpose of the study, the research objectives and the confidentiality of the data produced by respondents are outlined in the questionnaire. An online for this investigation, a questionnaire will be employed to collect data. An entire survey will be circulated through social media platforms such as Google Forms, WhatsApp, and Facebook. It was very convenient to minimize cost, and save time and significantly applicable during this pandemic outbreak.

Sampling

The sampling method used in this study was non-probability sampling which was convenience sampling. The questionnaire was distributed to the respondents who are among the household living in three urban areas in Peninsular Malaysia through online and social media. The study used this method because questionnaires were prepared and distributed online or posted them to on social media pages to gather information from the respondents.

$$s = \frac{x^2 Np(1-P)}{e^2(N-1) + x^2 p(1-p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as proportion (0.05)
$x2$ = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

The range of mean tables is used to measure how likely the respondents would agree or disagree with the statements of the questionnaires. Computers assisted the researchers by reducing the work necessary to gather data and facilitating quantitative analysis. Four types of data analysis were used in this study: frequency analysis, descriptive analysis, reliability test and Pearson correlation analysis. The data obtained was analysed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1: Frequency Analysis

Demographic	Frequency	Percentage
Gender		
Male	132	34.4
Female	252	65.6
Race		
Malay	278	72.4
Chinese	75	19.5
Indian	20	5.2
Others	11	2.9
Age		
21-30 years old	257	66.9
31 - 40 years old	114	29.7
41 - 50 years old	12	3.6
51 years old and above	1	0.3
Marital Status		
Single	216	56.3
Married	168	43.8
Education Level		
Diploma	128	33.3
Degree	248	64.6
PhD	8	2.1

Type Place of Study		
Public University	192	50.0
Private University	161	41.9
College of Skills	23	6.0
Others	8	2.1
Total	384	100.0

A total of 384 questionnaire sets were assigned through the online platform. This portion contained the respondents' contextual profiles. This section focuses on the demographic profile and background of the respondents, including gender, race, age, marital status, education levels, and type of place of study. Table 1 shows the summarized demographic results of the respondent's profile. The total number of male respondents is 132, while the total number of female respondents is 252. Male respondents comprised 34.4% of the total 384 respondents, while female respondents made up 65.6%. With 278 responses, the data shows that Malays form most of those who participated in the race (72.4%). Chinese came in second with 12 replies, accounting for about 3.1% of the total. The Indians were next, with 20 replies representing 5.2 percent of the total and 11 respondents representing 2.9 percent of the total from other races.

As shown by table 1, the data revealed that most of those who answered the questionnaire were between the ages of 21-30 years old, with 257 people answering and a response rate of 66.9%. Then came the 31-40 age group, which had 114 responders and a 29.7% response rate. The age group of 41-50 years old had 12 respondents and a response rate of 3.1%. Finally, 1 person in the 51 years old and above group answered the survey, accounting for 0.3% of all respondents. According to the table, the total number of single respondents is 216, while the total number is 168. Single respondents comprised 56.3% of the total 384 respondents, while married respondents made up 43.8%.

At the educational level, most respondents are from the diploma, with 128 respondents and a value of 33.3%. Respondents from the degree with 248 respondents and a value of 64.6%, followed by respondents from the PhD with 8 respondents and a value of 2.1%.

According to the table, the type place of study for the public university has the largest percentage of respondents (50.0%) with 192 respondents. For the private university, 41.9% came in second with 161 replies, College of skills, about 6.0% of the total with 23 replies. The others were next, with 8 replies representing 2.1% of the total.

Furthermore, all 384 respondents have had replied to the sample with 100 percent.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Attitude of graduates	I am demanding for higher salary.	4.39	0.768
	I am to choosy about the position offered by an organization.	4.18	0.758
	I am unable to work in a teamwork	4.16	0.760
	I need to choose a job that has a similar employment scope to my greatest level of study.	4.16	0.708

	I have a qualification that does not match the employer's recruitment for admission into the hospitality industry,	4.17	0.702
	The attitude of employers who are too calculating and want employees with cheap wages.	4.17	0.729
Style of employment	I do not have any leadership abilities. .	4.21	0.734
	I have a poor communication skill.	4.18	0.697
	I do not prefer to work overtime.	4.23	0.717
	I am prefer working in structure.	4.32	0.580
	I am prefer working alone.	4.26	0.630
	There are sufficient employees to serve the customers.	4.28	0.582
Level of interest and commitment	I am not very interested in the field or hospitality.	4.22	0.643
	Do you feel you have personally been discriminated against by a potential employer, or not.	4.09	0.811
	I do not understand how to contribute to organization goals	4.16	0.766
	My organization not inspire me to give my best shot at work.	4.13	0.790
	I want to work in the hotel sector, but my command of the English language is limited.	4.13	0.779
	The workplace does not have a pleasant atmosphere.	4.15	0.780
Unemployment rate among hospitality industry graduates	Graduates work in a field that did not match with heir qualification	4.45	0.676
	Growing in a job vacancy are only occupied by selected workers.	4.45	0.632
	The employment demanding for higher salary are to meet the ever-growing cost of living	4.52	0.587
	Lack of work experience in the hospitality field.	4.49	0.638

	4.49	0.613
The employment is too choosy about the company or job offer to them.	4.49	0.613
Unemployment occurs due to lack of communication and English language skills.	4.45	0.738
Employees are less interested in the field of hospitality industry jobs	4.49	0.642

The descriptive analysis that showed independent variables verified a moderate mean score (M = 4.4788, SD = 0.49853). The mean score for all dimensional variables was moderate, with the attitude of graduates at 4.2075 (SD = 0.62715), style of employment at 4.2519 (SD = 0.50115), and level of interest and commitment at 4.1458 (SD = 0.67323). Furthermore, the dependent variable verified the middle mean score (M = 4.4788, SD = 0.49853), with unemployment rate among hospitality industry graduates of 4.4788 (SD = 0.49853) as a sub-variable.

Result of Reliability Analysis

Table 3 below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Attitude of graduates	6	0.923
Style of employment	7	0.886
Level of interest and commitment	7	0.953
Unemployment rate among hospitality industry graduates	7	0.888

In this variable, the number of items is as follows: attitude of graduates (6), style of employment (7), level of interest and commitment (7), and the unemployment rate among hospitality industry graduates (7). This analysis used the reliability analysis to determine Cronbach's Alpha values for all variables. The values are as follows: attitude of graduates (0.923), style of employment (0.886), level of interest and commitment (0.953), and the unemployment rate among hospitality industry graduates (0.888). All the reliability was above the 0.8 and 0. 9 average, usually considered excellent (Matkar, 2012).

Result of Pearson Correlation Analysis

Table 5 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	Result	Findings of Data Analysis
H1:. There is a relationship between salary and the unemployment rate among hospitality graduates in Malaysia.	r = 0. 692, p = 0.000 Strong positive	**H1: Accepted**
H2: There is a relationship between style of employment and the unemployment rate among hospitality graduates in Malaysia	r = 0. 794, p = 0.000 Strong positive	**H2: Accepted**
H3: There is a relationship between working atmosphere and the unemployment rate among hospitality graduates in Malaysia.	r = 0. 422, p = 0.000 Weak positive	**H3: Accepted**

Hypothesis 1 (H1) proposed that the attitude of graduates positively correlates with the unemployment rate among hospitality industry graduates. The finding reported in this study revealed that the attitude of graduates recorded the value of Pearson Correlation, which is r = 0.692, p = 0.000. Thus, the result accepts hypothesis 1 (H1), whereby the attitude of graduates is strong and positively significant to the unemployment rate among hospitality industry graduates.

Hypothesis 2 (H2) proposed that style of employment positively correlates with the unemployment rate among hospitality graduates. The finding reported in this study revealed that the style employment recorded value of Pearson Correlation, which is r = 0.794, p = 0.000. Thus, the result accepts hypothesis 2 (H2), whereby style employment is substantial and positively significant to the unemployment rate among hospitality graduates.

Hypothesis 3 (H3) proposed a level of interest and commitment that positively correlates with the unemployment rate among hospitality graduates. The finding reported in this study revealed that the level of interest and commitment recorded value of Pearson Correlation, which is r = 0.422, p = 0.000. Thus, the result accepts hypothesis 3 (H3), whereby the level of interest and commitment is weak and positively significant to the unemployment rate among hospitality graduates.

DISCUSSION AND RECOMMENDATION

Graduates' attitudes should be obtained, as those are important criteria that can help them get jobs. Through the findings, it is revealed that most of the respondents agreed that most graduates are having problems applying what they learned at the educational institutions in the working places. Besides, most of the graduates are having problems from the aspect of employability skills. This includes problems in communication skill, especially in the English language; the graduates are not well-disciplined and do not have leadership skills.

The study's findings revolve around the technical and employability skills among the graduates that became the factor for the unemployment issue research continuation. Consequently, these graduates are facing problems getting a place in a working world, as they cannot compete and give commitments to work. The Graduate Tracer Study Report in 2009 found that about 81.7% of the unemployed graduates stated that they are in dire need of additional training. These include training in English language skills, career development, ICT skills, communication skills and entrepreneurial skills (Graduates Tracer Study System by Ministry of Higher Education, 2009). Lack of high-levelled skills, especially in technical and employability skills, influence the concept of employability and becomes one of the factors to the unemployment problem amonggraduates (Susima and Sunanda,2003).

For recommendation, Abd Hair et al. (2007) mentioned that technical and employability skills become a determining factor for a graduate to get a job. Therefore, it is important to include technical and employability skills elements in the curriculum for each course or field of study offered in educational institutions. The current world of development in this technological era emphasizes mastering technical skills (hard skills) and employability skills by every graduate. Employers and industry associations commonly associate the lack of soft skills such as a positive work ethic, communication skills, team working, decision-making skills and leadership as a key factor affecting the employability of Malaysian graduates.

CONCLUSION

In conclusion, this study has been accomplished to discover the impact of graduates in the hospitality industry in Malaysia. Four independent variables, namely attitude of graduates, style of employment, and level of interest and commitment been chosen to examine their relationships with the dependent variable, which is the unemployment rate among hospitality industry graduates in Malaysia. A total of 363 respondents from the age of 21 – 30 years old were selected from all states in Malaysia to examine themselves the unemployment rate in the hospitality industry in Malaysia. Overall, based on Pearson's correlation analysis, the attitude of graduates scored a value of *0.924, followed by style of employment with *0.885, and level of interest and commitment with *0.953.

ABSTRACT

Customers' priority is placed on service quality. The shell-out restaurant setting appears to keep customers happy. As a result, customers that want to have a more in-depth conversation with personnel appear to be denied this opportunity, resulting in customer unhappiness. This study determines the relationship between service quality and customer satisfaction in shell-out restaurants. This study was conducted in Malaysia shell-out restaurants. The total sample size for this study was 384 respondents, who were randomly selected to answer 30 questions. The results show that the dependent variable (customer satisfaction) is influenced by independent variables (reliability, responsiveness, tangibles and empathy). There was a solid significant and positive correlation coefficient between reliability, responsiveness, tangibility, and empathy of influence service quality on customer satisfaction towards shell-out restaurants in Malaysia. The findings of this study can be used as a guide for hospitality operators and academics looking to understand the influence of service quality and customer satisfaction in shell-out restaurants.

Keywords: Service quality, Customer Satisfaction, Reliability, Responsiveness.

INTRODUCTION

The issue at hand concerns service quality in the restaurant hospitality industry. Due to the poor quality of service provided, low quality service will have a negative impact on a restaurant. Service quality problems can be created with some additions or adjustments, as well as doing a good job, possibly resulting in high high-quality service. Thus, customer opinion is important to an organization, and customer satisfaction with quality services should be high. This study aims to determine customer satisfaction with the quality of service a restaurant provides. A conceptual framework and hypothesis will be used further to explain the link between the independent and dependent variables. The summary will wrap up the entire conversation.

This study explains and explores the methodology and procedures used to measure service quality and customer satisfaction at a shell-out restaurant. The research design, population and sample size, sampling procedure, data collecting, research instruments, and data analysis were all described in this study. Validity and reliability are critical in determining if the samples collected are valid and predictable. As a result, the reliability test will be conducted using Cronbach's alpha approach. Additional analysis and exploration of the link between the variables will be conducted using Pearson's correlation test.

The first section explores and highlights the results supporting the analysis's main objective.

1. To determine the relationship between service reliability and customer satisfaction towards shell-out restaurant
2. To determine the relationship between responsiveness and customer satisfaction towards shell-out restaurants.
3. To determine the relationship between service tangibility and customer customer satisfaction towards shell out restaurants.
4. To determine the relationship between empathy and customer satisfaction towards shell out restaurants.

Researcher

This research aims to provide clearer information and address the entire existence of information to new researchers. This research also provides future studies with new sources, knowledge and up-to-date information on customer satisfaction with restaurant services in Malaysia. In Malaysia, for example, service quality and customer satisfaction are the pillars of an organization's effectiveness and profitability. Most organisations compete fiercely to continue to retain customers by highlighting the uniqueness of their respective services in the marketplace.

Authority

The further importance of this study is how service quality affected customer satisfaction at Malaysian take-out restaurants. This research will provide information to the authorities who wants to attract and retain customers must be concerned about service quality. This study also raises awareness of the shortcomings of the shell-out restaurant and makes recommendations to help them improve. The shell-out restaurant will better understand its customers' needs as a result of this research. Implementing approaches suited for the scenario can help restaurants operating in a highly competitive market improve numerous elements such as fairness of service quality, food quality, service tangibility, and service reliability. The findings of this study will give restaurant owners a better knowledge of how restaurant service quality affects customer satisfaction, which in turn influences their behavioural intentions, such as return visits, referrals, and good word-of-mouth.

Consumer

This study is also important to consumers. Since consumers or communities are important contributors to quality service, several studies have examined quality service influencing customer satisfaction. Measuring customer satisfaction is an important element in providing better, more efficient and more service effective (Eboli & Mazzulla, 2015). When customers feel dissatisfied with a service, the service can be identified as ineffective and inefficient (Alom et al., 2019). The study also attracted the community's interest to look at the quality services provided.

LITERATURE REVIEW

Definition of Reliability

Reliability is a significant component of hospitality and leisure. The capacity to "perform the promised service reliably and accurately" or "deliver on its promises" is referred to as reliability. Customers like to do business with companies that follow through on their commitments, which is usually communicated to the firm's customers implicitly (Kassie, 2017). Some businesses, such as restaurants, may make it a point of differentiation in their services. Customer satisfaction might be defined as fresh food supplied at the correct temperature and accurately for the first time in the food and beverage business.

The importance of reliability in goods and services has recently been questioned. For example, where there is significant variation in faults between competing products and customers can distinguish the variation, dependability is likely to drive overall quality. Effective service organisations figure out how to use the inherent flexibility of service production to more than compensate for the difficulties of achieving consistent and predictable service quality.

Responsiveness

Plenty of restaurant problems and their solutions have to do with customer service especially on responsiveness of their staff. The willingness to assist clients and deliver prompt service is referred to ascalled responsiveness (Kassie, 2017). This dimension is concerned with

immediately and carefully responding to customer requests, queries, and complaints. When a company tells its clients how long it will take to acquire answers or have their problems resolvedresolve their problems, it is said to be responsive. Companies must consider responsiveness from the customer's perspective rather than from the company's perspective in order tthe company's perspectiveo be successful (Kassie, 2017). Nowadays, shell-out restaurants are an example of a widely distributed food industry in MalaysiaMalaysia's widely distributed food industry.

According to prior research, responsiveness is the readiness to assist clients and deliver timely service. The theoretical structure, for example, serves as the foundation for all studies. It is a rationally generated, defined, and elaborated association network among variables judged significant to the problem, developed through techniques like observation and literature study.

Tangibility

Tangibles are the physical appearance of facilities, equipment, personnel, and textual documents is, referred to as dimensions. It refers to the appearance and condition of the silverware, dinnerware, staff uniforms, the menu's appearance and design, andestaurant signage and marketing (Kassie, 2017). Firms use tangibleto convey image and signal quality (Kassie, 2017). Customer impressions of tangible service quality can be influenced by facilities such as a well-equipped reception desk or skilled people.

Meanwhile, all tangible aspects of service quality be given special attention because they have an impact on customer loyalty and can result in increased revenues for the company. Nagy (2019), for example, measured five satisfaction assessments toward the facilities supplied at Langkawi Island jetty terminals, including comfort, safety, cleanliness, sufficiency, and functionality.

Empathy

Empathy is described as "the firm's caring, personalised attention to its customers." (Kassie, 2017). The customer is regarded as a one-of-a-kind individual. Empathy can be demonstrated in various ways, including knowing the customer's name, preferences, and needs. The capacity to deliver personalised services is a competitive advantage for many small businesses versus larger corporations (Kassie, 2017). In industries where creating relationships with clients is more important than "transaction marketing," this dimension is also more appropriate.

In the context of fine dining, empathy can be expressed by demonstrating concern in times of service failure and giving service recovery, or by going out of your way to fulfil a customer's unique needs, such as vegetarian food. For example, prompt service customers expect quick service and long lines at the counters, therefore, an empathy restaurant may not be appropriate. In a fine dining establishment, on the other hand, empathy may be necessary to maintain client loyalty because the waiter understands how the customer prefers his or hetheir meal prepared. Some clients, on the other hand,On the other hand, some clients may simply want to be left alone to enjoy their cuisine and do not want excessive attention.

Customer Satisfaction

Customer happiness has been the most crucial factor in corporate success from the beginning of time. Customer satisfaction has been a priority for firms in all market sectors, including the aviation industry, hospitality and tourism industry, and food service sector, hospitality, tourism, and food service sectors, since the twentieth century, according to studies (Anderson & Sullivan, 1993). As a result, customer satisfaction is linked to a person's 155 positive or negative emotions (Kotler and Keller, 2011: 144). So, for any type of business to prosper in the market with their services and products, client happiness is critical, especially for well-known customer service satisfaction such as Shell out restaurant customer service.

Research Hypothesis

The literature review highlighted that independent variables like reliability, responsiveness, tangibility and empathy affect customer satisfaction. Therefore, the study planned to examine 114 the level of effect among these variables. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H1 There is a significant relationship between reliability and customer satisfaction towards the shell-out restaurant.

H2 There is a significant relationship between responsiveness and customer satisfaction towards the shell-out restaurant.

H3 There is a significant relationship between tangibility and customer satisfaction towards the shell-out restaurant.

H4 There is a significant relationship between empathy and customer satisfaction towards the shell-out restaurant.

Research Framework

Figure 1 below shows the research framework used for this study
Figure 17: Research Framework

METHODOLOGY

Research Design

This study used the quantitative method where questionnaires were distributed to 384 respondents were had to dine in at the shell-out restaurant. In this research, the target populations chosen were Malaysian citizens.

Moreover, a set of questionnaires was distributed to the population to collect the data: people who dine in at shell-out restaurant. This questionnaire used the format of multiple choices and 5-point Likert scales of agreement. The researcher divided the questionnaire into 4 four sections which are Section A, B, C and D. For Section A, the questionnaire requested for the general information about the Malaysian citizen's households' demographics, such as the living area of respondents, gender, age, race, education level, working status, income level and family members of demographic information. For Sections B, C and D, the questions elaborated more on the dependent and independent variables, which were (i) Reliability, (ii) Responsiveness, (iii) Tangibility, and (iv) Empathy that were examined in the survey.

Data Collection

Collecting and measuring information of gathering and evaluating information from various sources to create a complete and accurate picture of a subject. Data collection aids a person or organization answer important questions, evaluate outcomes, and forecast future probability and trends. An online for this investigation, a questionnaire will be employed to collect data. An entire survey will be circulated through social media platforms such as Google Forms,

WhatsApp, and Facebook. It was very convenient to minimize cost, save time and significantly applicable during this pandemic outbreak

Sampling

The sampling method used in this study was non-probability sampling which was convenience sampling. The questionnaire was distributed to the respondents who are among the household living in three urban areas in Peninsular Malaysia through online and social media. The study used this method because questionnaires were prepared and distributed online or posted them to on social media pages to gather information from the respondents.

$$s = \frac{x^2 Np(1 - P)}{e^2(N - 1) + x^2 p(1 - p)}$$

n= sample size
N= population size
e = the degree of accuracy expressed as proportion (0.05)
$x2$ = chi-square of degree of freedom 1 and confidence 95% (3.841)
p = proportion of population (if unknown, 0.5)

Data Analysis

Computers assisted the researchers by reducing the work necessary to gather data and facilitating quantitative analysis. Four types of data analysis were used in this study: frequency analysis, descriptive analysis, reliability test and Pearson correlation analysis. The data obtained was analysed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

Table 1: Frequency Analysis

Demographic	Frequency	Percentage
Gender		
Female	252	65.6
Male	132	34.4
Race		
Bumiputera Sabah	1	0.3
Chinese	26	6.8
Indian	36	9.4
Malay	321	83.6
Age		
Less than 20 years old	4	1.0
21 - 30 years old	363	94.5
31 - 40 years old	14	3.6
41 - 50 years old	3	0.8
Marital Status		
Married	26	6.8
Single	358	93.2
Education Level		
Certificate	3	0.8
Postgraduate	11	2.9
Secondary	51	13.3

Undergraduate	319	83.1
Occupation		
Employed	61	15.9
Student	321	83.6
Unemployed	2	0.5
Have you ever dined in at the Shell out restaurant?		
Yes	384	100.0

A total of 384 questionnaire sets were assigned through the online platform. This portion contained the respondents' contextual profiles. This section focuses on the demographic profile and background of the respondents, including gender, race, age, marital status, education levels, occupation, and you have ever dined in at the Shell out restaurant. Table 1 shows the summarized demographic results of the respondent's profile. The total number of male respondents is 132, while the total number of female respondents is 252. Male respondents comprised 34.4% of the total 384 respondents, while female respondents made up 65.6%. With 321 responses, the data shows that Malays form most of those who participated in the race (83.6%). Indians came in second with 36 replies, accounting for about 9.4% of the total. The Chinese were next, with 26 replies representing 6.8 percent of the total and one respondent representing 3 percent of the total from other races.

As shown by table 1, the data revealed that most of those who answered the questionnaire were between the ages of 21-30 years old, with 363 people answering and a response rate of 94.5%. Then came the 31-40 age group, with 14 responders and a 3.6% response rate. The age group of 41-50 had 3 respondents and a response rate of 8%. Finally, 4 people in the less than 20 age group answered the survey, accounting for 1% of all respondents.

According to the table, the total number of married respondents is 26, while the total number of single respondents is 358. Married respondents comprised 6.8% of the total 384 respondents, while single respondents made up 93.2%.

At the educational level, most respondents are undergraduate, with 319 respondents and a value of 83.1%. Respondents from the secondary education level came in second with 51 respondents and a value of 13.3%, followed by respondents from the postgraduate with 11 respondents and 2.9%. Finally, the certificate had the lowest response rate, with 3 people responding for a total of 0.8%.

According to the table, student respondents account for the most significant percentage of respondents (83.6%) with 321 respondents. Employed came in second with 61 replies, accounting for about 15.9% of the total. The Unemployed were next, with 2 replies representing 5% of the total.

Furthermore, all 384 respondents had to dine in at the Shell Out restaurant with 100 percent.

Result of Descriptive Analysis

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Service Reliability	The employees are always taking the right order from customers.	4.22	0.717
	Provide service as promised to customers to maintain the quality and reputation of the restaurant.	4.36	0.744

	Provide fast service as promised time to meet customer needs accurately.	4.22	0.725
	Maintain error-free records in order to maintain the good name of a restaurant.	4.34	0.765
	Reliability in dealing with customer service problems in a thoughtful and professional manner.	4.21	0.718
	Maintain service performance to attract more customers.	4.36	0.749
Responsiveness	The restaurant is smart in resolving guest complaints and balancing inconveniences.	4.21	0.708
	Services delivered on time.	4.35	0.751
	The waiting time to be served is acceptable from customer.	4.23	0.725
	The employees are willing to help customers.	4.35	0.746
	Employees have a good understanding of the needs of the customers.	4.21	0.713
	There are sufficient employees to serve the customers.	4.36	0.759
Service Tangibility	The condition of the restaurant is clean, tidy and the staff is dressed appropriately.	4.22	0.718
	Sufficient parking area is available at the restaurant.	4.34	0.761
	The shell out restaurant has a visually attractive dining area.	4.21	0.717
	Has good lighting in every room.	4.34	0.765
	The menu is easy to read, understand and can attract customers.	4.24	0.713
Empathy	The employees are always pay attention to the customer.	4.21	0.716
	The employees can communicate and understand the need of customers.	4.36	0.749
	Employees welcoming customers by greeting and smiles.	4.20	0.722
	The shell out restaurant offers a number of appealing and easily accessible packages and sets.	4.37	0.750
	The employees are always courteous and polite.	4.21	0.706
	Employees know how to deal with difficult	4.35	0.750

	situations such as handling customer complaints professionally.		The
Customer Satisfactio n	I will recommend the restaurant to other people.	4.23	0.728
	I will recommend others about the restaurant experience.	4.35	0.746
	Overall, I am satisfied with the overall experience in shell out restaurant.	4.23	0.727
	I feel employees have the ability perform the services/work expected with trust and responsibility.	4.34	0.755
	I was satisfied with the service provided from the shell out restaurant.	4.23	0.715
	I am quite pleased with the waiter's/ability restaurant's to clearly and thoroughly answer all of my inquiries.	4.36	0.755

descriptive analysis that showed independent variables verified a moderate mean score (M = 4.2904, SD = 0.62671). The mean score for all dimensional variables was moderate, with service reliability at 4.2834 (SD = 0.61662), responsiveness at 4.2852 (SD = 0.61618), service tangibility at 4.2682 (SD = 0.62283), and empathy at 4.2839 (SD = 0.61754). Furthermore, the dependent variable verified the middle mean score (M = 4.2904, SD = 0.62671), with customer satisfaction of 4.2904 (SD = 0.62671) as a sub-variable.

Result of Reliability Analysis
Table 3 below shows the result of the reliability analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Service Reliability	6	0.915
Responsiveness	6	0.916
Service Tangibility	5	0.902
Empathy	6	0.919
Customer Satisfaction	6	0.923

In this variable, the number of items is as follow service reliability (6), responsiveness (6), service tangibility (5), empathy (6), and customer satisfaction (6). This analysis used the reliability analysis to determine Cronbach's Alpha values for all variables. The values are as follows: service reliability (0.915), responsiveness (0.916), service tangibility (0.902), empathy (0.919), and customer satisfaction (0.923). All the reliability was above the 0.9 average, usually considered excellent (Matkar, 2012).

Result of Pearson Correlation Analysis

The Table 5 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothes is	Resul t	Findings of Data Analysis

H1: There is a positive relationship between reliability and customer satisfaction.	r = 0. 978, p = 0.000 Very high positive	**H1: Accepted**
H2: There is a positive relationship between responsiveness and customer satisfaction.	r = 0. 980, p = 0.000 Very high positive	**H2: Accepted**
H3: There is a positive relationship between tangibles and customer satisfaction.	r = 0. 967, p = 0.000 Very high positive	**H3: Accepted**
H4: There is a positive relationship between empathy and customer satisfaction.	r = 0. 986, p = 0.000 Very high positive	**H4: Accepted**

Hypothesis 1 (H1) proposed that reliability positively correlates with customer satisfaction. The finding reported in this study revealed that the reliability recorded value of Pearson Correlation, which is r = 0.978, p = 0.000. Thus, the result accepts hypothesis 1 (H1), whereby reliability is positively significant with customer satisfaction.

Hypothesis 2 (H2) proposed that responsiveness positively correlates with customer satisfaction. The finding reported in this study revealed that the responsiveness recorded value of Pearson Correlation, which is r = 0.980, p = 0.000. Thus, the result accepts hypothesis 2 (H2), whereby responsiveness positively impacts customer satisfaction.

Hypothesis 3 (H3) proposed that tangibility positively correlates with customer satisfaction. The finding reported in this study revealed that the tangibility recorded value of Pearson Correlation, which is r = 0.967, p = 0.000. Thus, the result accepts hypothesis 3 (H3), whereby tangibility is positively significant with customer satisfaction.

Hypothesis 4 (H4) proposed that empathy positively correlates with customer satisfaction. The finding reported in this study revealed that the empathy recorded value of Pearson Correlation, which is r = 0.986, p = 0.000. Thus, the result accepts hypothesis 4 (H4), whereby empathy positively impacts customer satisfaction.

DISCUSSION AND RECOMMENDATION

The discussion aims to resolve the questions and address the hypotheses as stated in the first chapter of this study. In general, this study has extensively studied the impact of service reliability, and customer satisfaction towards shell-out restaurants a substantial relationship. Based on the study's findings, the current study would provide several recommendations for SERVQUAL (service quality) to improve all the dimensions of service quality to bring higher perceived service quality and customer satisfaction.

Service quality is low as perceived by consumers in the shell-out restaurant and hence customer satisfaction. Consumers have higher expectations than what they receive from the shell-out restaurant, even though the difference is not wide. To answer our research questions, how customer satisfaction perceives service quality and are satisfied with service offered by shell-out, the gap scores analysis carried out provided answers to these questions. The overall perceived service quality is high as expectations exceed perceptions meaning consumers desired more than what was offered. As a result of this gap, the customer is clearly satisfied.

The research findings are also essential for future research continuation. Thus, it is recommended that future research examines the knowledge of SERVQUAL (service quality) towards customers satisfaction by including more demographic characteristics of the respondents such as ethnicity, religion, monthly income, marital status, occupation, and many more to generate different results or findings from various perspectives.

Furthermore, it is recommended that future researchers improvise the data collection of this study, especially in terms of questionnaire distribution. Rather than distributing the questionnaires through the internet, future researchers can engage in a face-to-face questionnaire distribution. As a result, the researchers can explain the research purpose in detail while distributing the questionnaires to the potential respondents. Additionally, an extent of interaction between the researchers and the respondents can also be helpful to enlighten the respondents more clearly about what will be asked in the questionnaires.

CONCLUSION

In conclusion, this study has been accomplished to discover the impact of service quality on customer satisfaction towards shell-out restaurants in Malaysia. Four independent variables, reliability, responsiveness, tangibility and empathy, were chosen to examine their relationships with the dependent variable, customer satisfaction among customers in Malaysia. A total of 363 respondents from the age of 21 – 30 years old were selected from all states in Malaysia to examine their satisfaction with shell-out restaurants. Overall, based on Pearson's correlation analysis, the reliability scored a value of *0.978, followed by responsiveness with *0.980, tangibles with *0.967, and empathy with *0.986.

Corresponding email: azimah.o@umk.edu.my

ABSTRACT

English proficiency in the hospitality industry becoming the most widely spoken language in the world and is an important language in the hospitality industry's services. Different studies have been conducted which focused on English language proficiency in numerous ways. As a result, customers that want to have a more in-depth conversation or ask the question with employees appear to be denied this opportunity, resulting in customer unhappiness. This study determines the relationship between communication skills, language competency, and personal motivation toward English language proficiency. The researchers used a Google Form as a methodology to collect data. The target respondent for this study was 384 respondents. As a result, the reliability test will be conducted using the Cronbach's Alpha approach. Additional analysis and exploration of the link between the variables will be conducted using Pearson's correlation test. The correlations' results answered the research questions of whether there is a relationship between the independent and dependent variables.

Keywords: English Language, Communication Skills, Language Competency, Personal Motivation.

INTRODUCTION

English Language Proficiency in the Hospitality Industry, with English currently being the most commonly spoken language worldwide. Because hospitality business includes travel and tourism, having a common language spoken by all personnel in this industry is critical (Alom et al., 2019). In a non-English speaking nation, someone working in a hotel, restaurant, or travel agency is expected to have a decent command of the English language. Although various nations worldwide have their own distinct tourism riches, they all speak the same language, which makes workers and tourists feel at ease.

English has become a widespread language that has touched every corner of the globe and every business, from technology to marketing to health to teaching. It is a well-known truth that knowing a region's language is quite useful when connecting with its residents. People from different regions can converse in English since English has broken down all geographical borders. The hospitality and tourism sector is immensely diversified since it caters to visitors from all walks of life, each with their language, ethnicity, and cultural norms. The English language has become the international business language. As a result, effective and outstanding communications and acceptable English language ability are important for providing a positive visitor experience. As a result, the English language aids the industry's efficiency, production, and profitability. Because individuals from all over the world are increasingly travelling to even the most remote and exotic corners of the globe, it is critical for hospitality and tourism workers to communicate effectively with visitors and other staff. The advantages of speaking English may be apparent in the professional's career trajectory. Those who do not speak English as their first language and do not study it to advance in their careers will fall behind. Then they suffer due to their lack of knowledge and communication skills, as well as their difficulty comprehending basic instructions and information. This study consists of three objectives:

1. To identify the relationship between communication skills and English language proficiency in the hospitality industry.

2. To identify the relationship between language competency and English language proficiency in the hospitality industry.

3. To identify the relationship between personal motivation and English language proficiency in the hospitality industry.

Significance of Study

The variables that encourage an employee in the hotel business to master English are found in this study. The usage of English as a transitional language is dwindling. If this situation persists, an increasing number of people will be unconcerned. Employees in the hotel business must encounter a variety of hurdles to sustain work performance in acquiring the English language. This research will look at motivating employees to improve their English skills. Few people are interested in enhancing their speaking abilities. 4 Employee motivation to improve English language competence will be boosted by actions that shift their perceptions and mindsets.

Furthermore, individuals in the academic sector will profit from this study since they can acquire early education from school or university to learn more about English language competency, which is nearly unimportant. There are a lot of fascinating and incredible stories concerning English language competency. Because they have mastered English as an intermediate between international visitors and staff, they may feel more secure in their ability to advance in the hospitality sector. When guests inquire about their services, they will be more interested and appreciate a service that makes their lives easier. Employees will be able to increase their English language skills as a result.

Later, this research will aid the hospitality business in attracting tourists from overseas to go on a tour and stay in a location with personnel who are fluent in English and can provide excellent service. Many visitors visit the hotel not only to stay but also to eat in the restaurant and appreciate its beauty and uniqueness. Travel agents promoting hotels and eateries can entice foreign tourists to Malaysia. This will be a unique idea and an opportunity for staff to incorporate English language skills into their activities. Employees who speak English fluently can improve themselves and their workplace. Unique and beautiful employees will improve service quality and enhance the desire for visitors to our country.

Finally, the country will gain from this research. The hospitality business can entice individuals from all over the world to visit our country and spend their money. The government's increased tax collection will increase the country's earnings from this industry. Then, as employees' English proficiency level rises, job prospects will expand, and the unemployment rate will decrease. This will contribute to Malaysia's dignity being elevated. This will also contribute to the public's economic well-being in Malaysia.

LITERATURE REVIEW

Communication Skills

Effective communication with leaders encourages staff to stay motivated and accomplish their tasks effectively (Luthra & Dahiya, 2015). According to Emanuel (2011), good communication skills provide self-assurance by allowing a person to gain control over their lives through acquiring knowledge, conducting effective research, conceptualising, organising, and presenting ideas and arguments.

According to Hills (2015), employees who had regular interaction and communication with management and human resources specialists reported higher work satisfaction and a lower likelihood of quitting. As a result, positive communication between the employee and leader might be beneficial. The higher an employee's gratification as a result offrom good and positive communication, the less likely that individual will leave.

Language Competency

Language competence is necessary for employees to develop their work-related abilities and for local and international enterprises to improve their performance, expertise and technical abilities. It provides a basis for "process skills", which are problem-solving and critical-thinking abilities needed to deal with the environment. According to research, immigrants' ability to succeed in the labour market is hampered by a lack of English language abilities (Brooks 1996, Evans 1987). With more enterprises moving abroad, English has become the language Franca of the commercial world. Because most interviews are done in English, employers frequently judge candidates' abilities based on their ability to communicate in English (Ting, Marzuki, Chuah, Misieng, & Jerome, 2017).

Personal Motivation

Motivation may be defined as a type of cognitive decision-making to initiate and monitoring action directed at accomplishing a certain goal. Personal motivation is important for the employee to be confident and a leading function in influencing others to work toward companies' goals (Rozman, Treven and Cancer, 2017). The motivation of older employees to work and be active in the workplace has been examined in a few studies. Rozman, Treven & Cancer (2017) indicated that stereotypes about them having less competence, productivity, and motivation at work lead to fewer work-friendly circumstances.

Research Hypotheses

The hypothesis in this study is to find out whether English Language Proficiency is related to hospitality industry workers.

H₁	There is a positive relationship between communication skills and English Language Proficiency in the hospitality industry.
H₂	There is a positive relationship between language competency and English Language Proficiency in the hospitality industry.
H₃	There is a positive relationship between personal motivation and English Language Proficiency in the hospitality industry.

Research Framework

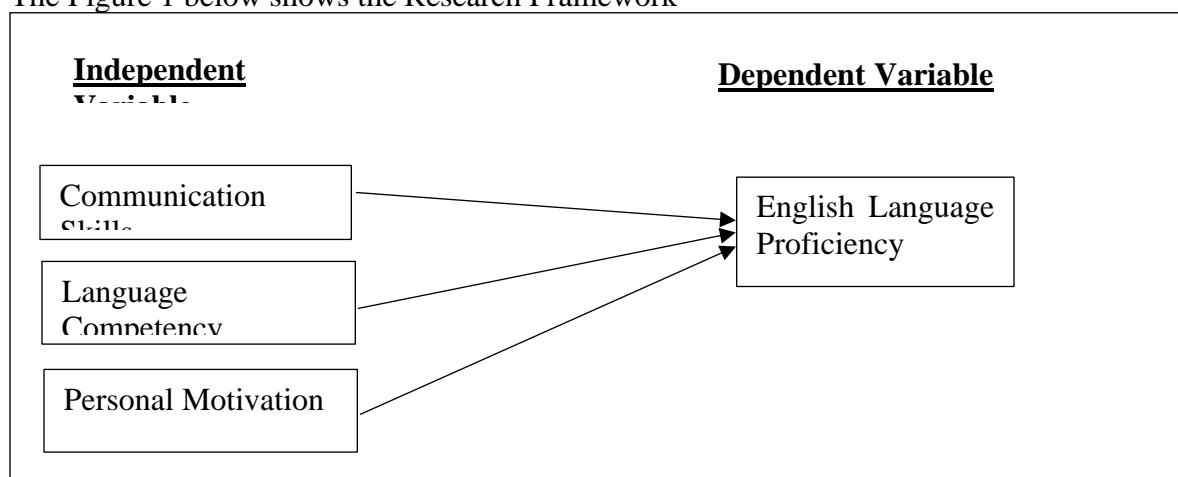
The Figure 1 below shows the Research Framework


Figure 18: Research Framework

722

METHODOLOGY

Research Design

The researcher will use quantitative methods based on raw data to conduct this research. To answer the research question, the researchers constructed a causal or experimental research design (Shariff, 2016). This is related to the researchers' aim to identify the elements influencing consumer satisfaction. A causality study is a type of research in which researchers investigate the relationship between independent variables, which are thought to impact the dependent variable. This study design's primary goal is to gather evidence concerning causation or to test hypotheses. In this study, researchers tested the relationship between Communication skills, Language Competency, Personal Motivation (independent variables) and English Language Proficiency (dependent variable).

Data Collection

Data collection is the process of gathering, measuring, and analysing correct insights for study using established approved procedures. Data collecting is frequently the first and most significant phase in the research process, regardless of the topic of study. A researcher can assess their hypothesis based on the information obtained. Different ways of data gathering are employed in different research disciplines depending on the information required. Questionnaires and surveys, for instance, would require the least amount of resources.

Researchers will conduct an online survey using Google Forms because it is the best option in this pandemic. Respondents who meet the criteria for this study will receive questionnaires via social media platforms such as WhatsApp, Telegram, Instagram, and Facebook.

Respondents should be people who fit the criteria for this study. To begin, the respondents must work in the hospitality industry. Second, the respondents must be Malaysian citizens. Before the respondent answers the question, the questionnaire asks a few questions to ensure they are qualified for the characteristics listed, such as job status, country, and English proficiency level.

Sampling

Sampling is the process of choosing a subset of a population to serve as a sample. The accuracy and cost-effectiveness of research are improved through sampling. The sampling procedure decides whether or not the study findings may be applied to other situations. In other words, sampling is the process of picking a tiny portion of a population to research.

Non-probability sampling was used in this study, and the type of sampling used was convenience sampling. Non-probability sampling has a number of advantages, including being very cost- and time-effective due to the use of an online questionnaire. As the name implies, convenience sampling entails collecting a sample or data from an area that is convenient and from the individuals who are most easily accessible. For example, create an online questionnaire using social media platforms like Facebook and messaging apps like WhatsApp or Google Form. Convenience sampling has the advantage of being able to collect data quickly and easily. The study would be able to collect data quickly and without having to move around, which is especially important during COVID19's social distancing period.

$$n = \frac{x^2 Np\,(1-p)}{e^2(N-1)\,+\,x^2 p(1-p)}$$

n = sample size
N = population size
e = acceptable sampling error
x^2 = chi square of degree of freedom 1 and confidence 95% = 3.841

P = proportion of population (if unknown 0.5)

Data Analysis

Data analysis tools assist users in processing and manipulating information, analysing relationships and connections between data sets, and detecting perception patterns and trends. Here is a complete list of methods for analysing the results used in the analysis.

Data analysis is the process of converting raw data into structured information to understand the issues raised by the research. It begins with a descriptive analysis of the data. The researcher will use SPSS software to generate data after collecting all of the information from the respondentsthe respondents' information. The steps in this study's data analysis are outlined below.

FINDINGS

Frequency Analysis

Table 1: below shows the frequency analysis for this study

Variable	Number of Respondent (N)	Percentage (%)
Gender		
Male	189	49.2
Female	195	50.8
Race		
Malay	284	64.6
Indian	11	2.9
Chinese	11	2.9
Bumiputra Sabah	107	27.9
Bumiputra Sarawak	7	1.8
Age		
21-30	336	87.5
31-40	32	8.3
41-50	12	3.1
51 and above	4	1.0
Educational Background		
SPM	18	4.7
STPM/Diploma/Matric	45	10.9
Degree	308	80.2
Master	15	3.9
PhD	1	3
Working Time		

724

Full-Time	241	62.8	
Part-Time	69	18.0	
Work While Working	74	19.3	
Do You Working in the Hospitality industry?			
Yes	384	100.0	

There were 384 hospitality employees have been participated in this study; 49.2% (n=189) were male respondents, and 50.8% (n=195) were female respondents. Besides that, most of the respondents were Malay, 64.6% (n=284), and the least were Bumiputra Sarawak (n=7), 1.8%. As for age, the highest was from 21-30 years old, 87.5% (n=336) and the lowest were 51 and above (n=4), 1.0%. Most respondents have a degree qualification for education background, 80.2% (n=308) and the least were PhD 3% (n=1). Also, the majority of working time were Full-Time 62.8% (n=241), Part-Time 18.0% (n=69), and work while working 19.3% (n=74). Last, do you work in the hospitality industry? Most of the hospitality employees response yes, 100.0% (n=384).

Descriptive Analysis

The Table 2 below shows the Descriptive Analysis.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Communication Skills	Arrange and inform guests of transport arrangements.	6.62	0.758
	Answer customers' enquiries on room rates orally (In person or through the telephone).	6.67	0.664
	Answer customers' enquiries on food or beverage orally (In person or through the telephone).	6.67	0.684
	Answer customers' enquiries on hotel facilities orally (In person or through the telephone).	6.65	0.637
	Explain hotel procedures and hotel policies to guests.	6.62	0.728
	Answer enquiries on fire escape route in the hotel.	6.65	0.710
Language Competency	Language ability of staff helps customer about what he can order.	6.58	0.775
	Language ability of staff helps to build trust between staff and customer.	6.55	0.806
	Language ability of staff gives customer useful advice about order could not get through menu.	6.51	0.811
	Language ability of staff helps to communicate with the customer easily body language.	6.42	0.864
	Empathetic language (dealing with child or special needs) shows concern about customer satisfaction.	6.52	0.817
	Empathetic language (dealing with child or special needs) of staff helps staff to solve problem related service.	6.50	0.861

Personal Motivation	I use too soft and unclear voice when communicating in English due to lack of confidence.	5.98	1.548
	I can express myself better in English when I am not talking face to face.	6.23	1.239
	Having English proficiency makes me more confident to communicate with English speakers.	6.55	0.777
	You feel excited when you have to speak English.	6.44	0.946
	When you do not know how to pronounce the word, you will lose the confident to speak English.	6.26	1.235
	Being confident when using English is very important in the industry.	6.73	0.626
English Language Proficiency	Poor communication skills in English impair the chances of recruitment during interviews.	6.60	0.827
	English language skill influences my career in many aspects.	6.68	0.658
	Is the speaking skill the most significant / important skill in the hospitality industry of the state?	672	0.625
	Do you think that lack of very communication skills heavily scuttles ones' career growth and prospects within this industry?	6.61	0.740
	Are better English Language skills an essential prerequisite for people joining any front office of the hotel industry?	6.64	0.762
	Do you think that English language skills constitute an essential part of your service within the industry i.e., hospitality industry?	6.71	0.656

The query with the highest mean 'Answer customers enquiries on food or beverage orally (in person or through the telephone)' (M=6.67, SD=0.684) followed by 'Answer customers enquiries on room rates orally (in person or through the telephone)' (M=6.67, SD=0.664), 'Answer enquiries on a fire escape route in the hotel ' (M=6.65, SD=0.710), 'Answer customers enquiries on hotel facilities orally (In person or through the telephone)' (M=6.65, SD=0.637), 'Arrange and inform guests of transport arrangements' (M=6.62, SD=0.758), 'Explain hotel procedures and hotel policies to guests' (M=6.62, SD=0.728).

Next, the mean score in language competency ranges from 6.42 to 6.58. The highest mean 'Language ability of staff helps customer about what he can order' (M=6.58, SD=0.775) followed by 'Language ability of staff helps to build trust between staff and customer' (M=6.55, SD= 0.806), 'Empathetic language (dealing with a child or special needs) shows concern about employee satisfaction' (M=6.52, SD=0.817), 'Language ability of staff gives customer useful advice about order could not get through the menu (M=6.51, SD=0.0811), 'Empathetic language (dealing with a child or special needs) of staff helps staff to solve problem-related service' (M=6.50, SD=0.861), 'Language ability of staff helps to communicate with the customer easily body language' (M=6.42, SD=861). It is assumed that the mastery of the language received an encouraging response from the respondents and was more beneficial to them.

Also, under personal motivation, the most highly meant 'Being confident when using English is very important in the industry ' scored (M=6.73, SD=0.626) followed by 'Having

English proficiency makes me more confident to communicate with English speakers' (M=6.55, SD=0.777), 'You feel excited when you have to speak English' (M=6.44, SD=0.946), 'When you do not know how to pronounce the word, you will lose the confidence to speak English' (M=6.26, SD=1.235), 'I can express myself better in English when I am not talking face to face (M=6.23, SD=1.239), and 'I use too soft and unclear voice when communicating in English due to lack of confidence (M=5.98, SD=1.548). This indicates that most respondents consider personal motivation to be a necessity for self-improvement and forward-thinking in the hospitality industry.

The most highly mean of English language proficiency in the rated outcome was 'Is the speaking skill the most significant skill in the hospitality industry of the state?' scored (M=6.72, SD=0.625) followed by 'Do you think that English language skills constitute an essential part of your service within the industry, i.e., hospitality industry?' (M=6.71, SD=0.656), 'English language skill influences my career in many aspects' (M=6.68, SD=0.658), 'Are better English Language skills an essential prerequisite for people joining any front office of the hotel industry?' (M=6.64, SD=0.762), 'Do you think that lack of communication skills heavily scuttles one's career growth and prospects within this industry?' (M=6.61, SD=0.740), and 'Poor communication skills in English impair the chances of recruitment during interviews' (M=6.60, SD=0.827).

Reliability Analysis

The Table 3 below shows the Reliability Analysis.

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Communication Skills	6	0.941
Language Competency	6	0.945
Personal Motivation	6	0.859
English Language Proficiency	6	0.910

The coefficient alpha obtained in the actual reliability test for communication skills is 0.941. The coefficient alpha calculated for language competency was 0.945. The coefficient result for personal motivation is 0.859. Furthermore, the survey's dependent variable, English Language Proficiency, gained 0.910 due to coefficient alpha. Based on the table, shows that all variables are highly reliable. In summary, the results of the reliability tests support the acceptability of the instruments employed throughout this research, and the concept examined is appropriate for the research area.

Pearson Correlation Analysis

The Table 4 below shows the Pearson Correlation Analysis.

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported / Not Supported)
H₁ There is a positive relationship between communication skills and English language proficiency.	$r = 0.674$, $p < 0.01$	H_1 is supported.
H₂ There is a positive relationship between language competency and English language proficiency.	$r = 0.724$, $p < 0.01$	H_2 is supported.
H₃ There is a positive relationship between personal motivation and English language proficiency.	$r = 0.694$, $p < 0.01$	H_3 is supported.

Table 4 illustrated the Pearson correlation coefficient, significant value and the number of cases which was 384. The correlation coefficient of r = 0.674, p < 0.01, suggested a strong positive correlation between communication skills and English proficiency. Moreover, the result suggested a strong positive correlation between language competency and English proficiency with r = 0.724, p < 0.01. The correlation coefficient shows a strong positive between personal motivation and English proficiency with r = 0.694, p < 0.01. Overall, the independent variables were significantly correlated with English language proficiency and in strong positive correlation.

DISCUSSION AND RECOMMENDATION

The primary goal of this research is to look into the English language skills of workers in the hospitality industry. The findings of this study may provide an opportunity for employees to improve their English language speaking skills. To begin, employees must master and understand the English language to communicate effectively with customers. SPSS analysis of the study's findings reveals that employees are not very skilled in mastering the English language. According to the findings of this study, the company should provide English language classes to its employees to improve their ability to communicate in English.

According to the results of this survey, most workers in the hospitality industry have difficulty finding work because they have difficulty speaking English. An additional study on employee and student awareness of the importance of mastering foreign languages such as English is proposed for future research. Furthermore, larger sample sizes are strongly advised for this study. This ensures that the results can be represented in greater depth in a specific location. It would also suggest that the sample size include an equal number of male and female students. If different genders significantly impact the survey in the use of English language, this can resolve the gender issue.

One of the factors that can affect an employee's career is the environment in which they use English. A highly recommended future study is to investigate the impact of the environment on English language proficiency more thoroughly and effectively. A more in-depth study to produce productive employees in the use of English in the hospitality sector will also be an interesting issue.

CONCLUSION

As stated in this research, discussions are dedicated to responding to questions and addressing hypotheses. This research investigated the importance of English language proficiency in the hospitality industry among workers. The latest research would offer numerous recommendations for language proficiency and future researchers based on the study's findings, allowing hospitality employees to reach their full potential toward customers. Independent variables of correlation were represented (0.674> 0.724> 0.694).

In conclusion, this study has been conducted to discover the importance of English language proficiency. The findings of the research can be concluded as most hospitality workers agree that English language proficiency is essential in the hospitality industry and can influence their career in many aspects. Communication skills, language competency, and personal motivation were chosen as independent variables to investigate their relationships with the dependent variable, English language proficiency among workers. All hypotheses were supported. A total of 384 respondents, ranging in age from 21 to 51 years old, were chosen to assess their English language proficiency. Overall, according to Pearson's correlation analysis, communication skills received a score of 0.674**, followed by language competency at 0.724**, and personal motivation at 0.694**.

Measuring the Satisfaction of Tourists Visiting Malacca During Holiday

Nazihah Asmuni, Nor Nabella Pauzi Norizrawani Mansor, Nor Syazwani Syahirah Mohd Rosli, &*Mohammed Ruqaimi Remeli

Faculty of Hospitality, Tourism and Wellness, Universiti Malaysia Kelantan

Corresponding email: ruqaimi@umk.edu.my

ABSTRACT

The tourism industry in Malacca has great potential in tourism because it is famous for its well-preserved culture and heritage. The tourism market is at a competitive level driving the industry to provide better services to maintain tourism satisfaction, which consists of many aspects, leading to better marketing and funding. The level of satisfaction of marketing travellers is important in influencing the selection of tourist destinations because of the satisfaction of its feedback in the use of tourism products and services. Travellers' satisfaction is greatly influenced by the quality of service, perception, and experience of the tourist destinations they have visited. This factor has increased the competitiveness between different tourist destinations and can also create a better experience for tourists. However, the facilities provided have become one of the priorities of tourists in choosing accommodation in a place, so this research aims to respond to the use of products and the relationship between services related to accommodation. Second to determine the relationship between facilities at the destination with tourist satisfaction. Finally, to study the relationship between travel agencies' services and tourist satisfaction in Malacca.

Keywords: Tourist Satisfaction, Travel Agency, Accommodation, Facilities

INTRODUCTION

Tourism is the world's fourth-largest industry and reliesn a demonstrated link between the sector and travellers (Davenport, 2006). According to World Tourism Organization (UNWTO, 2018), over 1 billion tourists visited in 2017, spending a total of 1.5 trillion dollars, accounting for 10% of global GDP. However, as more countries strive for visitor dollars, tourism has become increasingly competitive. Sustainable and responsible tourism are the most popular types of tourism since they aim to fit the demands of visitors and international locations while securing and expanding the company's future potential.

The international tourism sector is growing rapidly and will keep rising with countries' per capita incomes. This element has enhanced competition among different tourism locations, resulting in improved tourist experiences. The competitiveness of the tourism business forces the sector to give better services to keep tourists satisfied, which leads to better marketing and funds. The level of tourist happiness is a crucial factor for the travel and tourism sector to consider because satisfied customers spread great customer engagement and will be more willing to return to the same place (Kozak & Rimmington, 2000).

Tourism is one of the most important service industries in the world, and it is recognized as a major source of economic growth. This is because a well-developed tourism sector serves as a motivator for a country's economic development, assists in determining exchange rates, creates new employment opportunities, and results in social development that benefits both locals and visitors. Since the 1980s, Malaysia's government has paid special attention to the tourist industry, as the country's primary and secondary sectors have become increasingly reliant on it since its independence in 1957.

In Malaysia, the tourism industry is one of the most successful economic sectors, with a huge impact on the country's growth. For example, Kuala Lumpur, Malacca, George Town, and Langkawi are among Asia's top 10 tourist destinations, attracting a considerable number of people (UNWTO, 2019). In 2013, Malaysia's Ministry of Culture and Tourism has renamed

the Ministry of Tourism and Culture (MOTAC) to promote the country as a major tourist attraction. There are three objectives of this research:

1. To determine the relationship between the service related to accommodation and tourists' satisfaction.
2. To determine the relationship between the facilities at the destination and tourists' satisfaction.
3. To determine the relationship between the services related to the travel agency and tourists' satisfaction.

SIGNIFICANCE OF THE STUDY

Researcher

In tourism, accommodation is defined as providing sheltered overnight accommodation inappropriately equipped rooms, including at least one bed, for a fee, as the primary service to tourists, travellers, and lodgers. Food services, fitness activities, and green areas may be included in the provision of overnight sheltered accommodation.

Authorities

A service is a system that meets a public need, such as transportation, communication, or utilities like electricity and water. Tourism services include booking to transportation, lodging, food, and beverages in the destinations. Tourism and travel-related services will include all hotel and restaurant services, travel agencies and tour operator services, tourist guide services, and other related services.

Consumer

The destination refers to the state of the tourist's visit location. The demographics and geography must be considered and taken seriously because they will be major factors in tourist attractions. Some visitors or tourists are more likely to be drawn to the surroundings rather than the hotel.

LITERATURE REVIEW

Satisfaction of Tourists

Satisfaction will be created by the comparison that the customer's expectations have made before the trip and after the trip. The function of pre-travel expectations and post-travel experiences is referred to as satisfaction. If the services are provided according to the expectation or exceed the expectation of the customer, then it will be considered that customers are satisfied. If the tourist feels displeasure, the expected outcome will be dissatisfaction for the customer. From the discussion, it is understandable that two different dimensions will achieve tourist satisfaction: firstly, it will be related to the pre-expectation or pre-preparation and secondly, it referred to the delivered services after travel which is the real experiences that had been faced by the customers.

Other than fulfilling the customer needs, there are also safety measures which also have a significant effect on tourist behaviour. People have low interest in long-distance travel because of fear and worries about safety and dissatisfaction. To attract the attention of the customer, the owner of the business must follow all the safety measures that had been set up, such as having guards, 24 hours security camera that records all the people inside and outside movement of the hotel, other safety measures to be followed to make sure the safety of the tourist and the worker. Tourists' willingness to travel continues if they have promising satisfaction on their trip, which could happen if their safety is taken care of by the hotelier and themselves. As in the research, there are a few reasons for tourist satisfaction when enjoying their vacation.

Service-Related to Accommodation

Many types of leisure accommodations are being created and developed to meet the diverse needs of travellers. Accommodation quality is confirmed as the significant determinant of enhancing tourists' satisfaction. As highlighted by past studies, the physical elements do play some part in influencing the rural accommodation quality; specifically, the facility condition itself, the furnishing and the quality of the foods served (Alom et al., 2019; Ali & Amin, 2014).

Tourist satisfaction is important to tourism because visitor satisfaction is fundamental to tourism loyalty and other tourist referrals (Tornow and Wiley, 1991). The quality of service, perception, and experience at the tourist spots visited by the travelers have a huge impact on their satisfaction. If travel marketers succeed in providing quality travel services that delight customers, companies will gain a competitive advantage due to exceptional offerings that are difficult to imitate.

Facilities at Destination

Tourists frequently have preconceived notions about the sort and quality of services provided at a certain place. Tourists' satisfaction level will ultimately be determined by how well their expectations are realized. Tourists are deemed satisfied if the overall performance of a place matches or surpasses their initial expectations during or after their stay (Patwary, 2022). As a result, happy travellers are more inclined to promote the tourist site to others, which is the most cost-effective and efficient method of marketing and promotion.

In this way, it is broadly recognized that traveller fulfilment is progressively becoming a conspicuous issue in the travel and accommodation industries. Traveller fulfilment does not just work with the objective decision (Kozak and Rimmington 2000). Yet it additionally adds to expanded paces of maintenance of vacationers' support, unwaveringness and securing, which thusly helps in acknowledging financial objectives such as expanded number of sightseers and incomes. Tourists, as travellers, encounter products and services from various places, and their impressions of a vacation spot are shaped by contrasting the various facilities, attractions, and service levels.

Service-Related to Travel Agency

Since the earliest studies of the tourism industry, service quality, customer happiness, and loyalty have been considered important constructs, several studies in the tourism sector have found an encompassing relationship between service quality, customer satisfaction, and loyalty. Much research has shown customer satisfaction to act as an intermediary between service quality and loyalty. As a result, travel agencies seek to improve their service quality to boost customer satisfaction and loyalty so that customers will return to the same travel agency when planning a trip.

In the event of a service failure, an agency's service recovery strategy substantially impacts client satisfaction with tourism and tourism services. When the quality of service provided does not meet consumer expectations, it is referred to as service failure. To identify consumer dissatisfaction, travel agencies must establish an adequate service recovery plan. Customer satisfaction and positive customer relationships can both benefit from effective service recovery.

Research Hypothesis

The literature review highlighted the independent variables like service related to accommodation, destination facilities, and travel agency services. Based on the literature discussed, the hypotheses of this study were summarized in the following manner:

H₁ There is a significant relationship between service related to an accommodation and tourists' satisfaction.

H₂ There is a significant relationship between facilities at the destination and tourists' satisfaction.

H₃ There is a significant relationship between service related to the travel agency and tourists' satisfaction.

Research Framework

Figure 1 below shows the research framework used for this study

Figure 19: Research Framework

METHODOLOGY

Research Design

Based on our research paper, we are using quantitative data analysis to collect our information and using a deductive research approach in conducting this research. There are a few steps in deductive research approval: start with existing theory, formulate a hypothesis based on theory, collect data to test the hypothesis, and analyze the results. Our research is a quantitative data collection because it aims to measure the holiday satisfaction of Malaysian tourists visiting Malacca, which means that the researcher use survey to collect the data from the tourist. To standardize data gathering and generalize conclusions, quantitative research is frequently utilized. This method has advantages of replication, direct comparison of data, large samples, and hypothesis testing. Despite the advantages, there are a few disadvantages when using this approach: lack of context, structural bias, narrow focus, and superficiality in research. From the survey, researchers can identify the reason for tourist satisfaction when having their holiday in Malacca and get the systematic result from the questionnaire.

Data Collection

Data collection is a systematic process of gathering observations or measurement data. Before collecting the data, a problem statement must be written to define the researchers' findings. Depending on the research question, whether it is quantitative or qualitative data, needs to be made. If the goal of the study is to test a hypothesis, measure it precisely, or gather huge amounts of data, quantitative data will be used. In contrast, qualitative data will be collected if the goal is to explore ideas, understand experiences, and acquire detailed insight. There are a few data collection methods: experiment, survey, interview or focus group. Data collection can come from two sources: primary and secondary data. Primary data will be gained directly from the respondent, a real source, while secondary data come from a previous or current research paper.

In this research paper, the survey method of data collection will be used, which is primary data collection. When researchers wish to learn about the general character or opinions of a group of people, they conduct a survey. As in the research, we want to get the opinion of the tourist in Melaka about tourism satisfaction. We will distribute our questionnaire in a google form. We set a deadline on the questionnaire to ensure the respondent's feedback and make it more convenient for our respondents to answer the survey. We choose to get the data through an online survey are because of the standard operation procedure (SOP) that the government had set up to control the risks of Coronavirus infection. Although it has been allowed to travel, we still need to be cautious and reduce interactions in crowded places. Other than that, the cost of using paper can be minimized.

Sampling

A probability sampling technique is any technique that applies a few forms of random choice. To order to offer a random choice system, a mechanism or protocol must be accompanied that ensures that the numerous devices to the populace offer the same risk of being selected. While the non-probability sampling technique is, the samples are gathered so that every factor of the populace now no longer has a regarded risk of being selected. The degree of tendency in choosing the pattern is unknown.

In this study, the researchers chose a non-probability sampling technique which is convenient sampling. The researchers used convenient sampling to conduct this study which is probably the most common sampling technique to cover many surveys quickly and cost-effectively. The sample was selected because it is accessible by the researcher, which means it involves the recruitment of any available set of respondents that is suitable for use by the researcher.

Data Analysis

Data analysis is the most important aspect of research since the information gathered must be summarised. It involves interpreting data gathered by analytic and logical reason to determine patterns and relationships. Statistical analysis, content analysis, discourse analysis, thematic analysis, and textual analysis are all examples of data analysis. Researchers use the Statistical Package for Social Science (SPSS) for quantitative data collection to analyse the data obtained. SPSS is a statistical software program for interactive analysis and statistical framework. The data will be organized and summarized using descriptive statistics, followed by formal testing of hypotheses and population estimation using inferential statistics.

The spectrum of the mean table is used to measure how often the questionnaire provided to the respondent will be agreed or disagree. The demographic characteristic is the mean, median, mode, ratio and frequency in a descriptive analysis. The relationship between mean and the level of agreement and disagreement.

FINDINGS

Results of Frequency Analysis

Table 59: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	104	41.1
Female	149	58.9
Age		
Below 20 years old	23	9.1
21 years old to 30 years old	153	60.5
31 years old to 40 years old	37	14.6

41 years old to 50 years old	24	9.5	
51 years old to 60 years old	9	3.6	
60 years old and above	7	2.8	
Marital Status			
Single	165	65.3	
Married	76	30	
Divorced	12	4.7	
Occupation			
Government Employee	26	10.3	
Private Company Employee	17	6.7	
Personal Business	46	18.2	
Online Business	27	10.7	
Pension	12	4.7	
Housewife	18	7.1	
Student	107	42.3	
Income			
Below RM1200	97	38.3	
RM1300 to RM2300	72	28.5	
RM2400 to RM 3400	42	16.6	
RM3500 to RM4500	30	11.9	
RM4600 to above	12	4.7	
Education Level			
Uneducated	0	0	
Primary School	0	0	
Secondary School	62	24.5	
Post-Graduated	94	37.2	
Undergraduate	97	38.3	

The total number of respondents was 253, with the highest total number of respondents, females being 149 respondents. The highest percentage of respondents range in age from 21-to 30, with 153 respondents. Besides that, 165 respondents were single. The majority of respondents are a student, with 107 respondents. Furthermore, 97 respondents had an income below RM1200. In contrast, 97 respondents from undergraduate studies completed the questionnaire.

Results of Descriptive Analysis

Table 60: Descriptive Analysis

Variable	Item	Mean Score	Standard Deviation
Service-related to Accommodation	Hotel safety	4.01	0.976
	Hotel cleanliness	3.96	1.001
	Quality of service	4.00	0.972
	Quality of food	4.04	0.923
	Friendly and welcoming staff	4.06	0.907
	Hotel comfortability	4.08	0.911
	Other related facilities	4.05	0.929
Facilities at Destination	Town cleanliness	3.96	0.903
	Town safety	3.88	0.966
	Hospitality of people	3.82	1.105
	Cleanliness around the attractive spot	3.89	1.008

	Lively nightlife scene	3.89	0.992
	Shopping facilities	3.89	0.972
	Recreation facilities	3.87	1.050
	Historic shines	3.84	1.101
	Area accessibility	3.92	0.973
Service-related to Travel Agency	Agency is organized	3.62	1.230
	The instructor was available and helpful	3.57	1.222
	Agency expertise	3.66	1.184
	Staff behaviour and attitude	3.67	1.189
	Transportation	3.61	1.247
	Providing information	3.64	1.221
	Services of guides	3.62	1.253
	Bookings	3.65	1.240
	Skillful staff	3.67	1.224
Satisfaction of Tourist	What are the most important causes of satisfaction?	1.70	0.743
	I will encourage other people to visit Malacca because of its services in accommodation	4.717	0.825
	I will use the service that I have used before because the facilities provided are very encouraging	4.06	0.840
	I will use the same service related to the travel agency that I had used before	3.77	1.064

Table 2 shows the mean score and standard deviation value for both the independent variable and dependent variable. In the independent variable, the highest mean score is facilities at the destination (34.97). While for the standard deviation, the highest value is service related to the travel agency (10.333).

Results of Reliability Analysis

The table below shows the results of the reliability analysis

Table 61: Reliability Analysis

Variable	Number of items	Cronbach's Alpha
Service-related to accommodation	7	0.976
Facilities at destination	9	0.973
Service-related to the travel agency	9	0.983
Satisfaction of tourists	4	0.725

Table 3 shows the result of the reliability analysis using the Cronbach Alpha based on each independent and dependent variable. The highest value of the Cronbach Alpha is 0.983 for the service related to travel agency which is excellent internal consistency.

Results of Pearson Correlation

Table 4 below shows the Pearson Correlation Analysis

Table 62: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H_1: There is a significant relationship between service related to an accommodation with the satisfaction of tourists.	0.480	H_1 is supported
H_2: There is a significant relationship between facilities at the destination with the satisfaction of tourists.	0.591	H_2 is supported
H_3: There is a significant relationship between service related to the travel agency with the satisfaction of tourists.	0.517	H_3 is supported

Based on the results Pearson Correlation Coefficient shown in table 4, the strongest relationship between facilities at the destination with the satisfaction of tourists is 0.591. Therefore, there is a significant relationship between them.

DISCUSSION AND RECOMMENDATION

This study suggests that more research on foreign tourist travel in Malacca should be conducted because this research was limited to Malaysian visitors. The results of this study may differ if it is extended to international visitors who come to Malacca. As a result, instead of focusing just on local tourists, other foreign tourists also should answer surveys to collect large data. In addition, additional responses from international and domestic tourists should be included. As a result, the researcher will have an easier time collecting data and a larger sample size.

Besides that, the current study only looks at three characteristics influencing local tourist satisfaction with Malacca tourism services. However, other important factors influencing the satisfaction of Malaysian tourist customers may be overlooked in this study. As a result, future researchers may propose new variables to evaluate their new findings.

Next, conduct an interview or ask open-ended questions rather than asking respondents to complete a scale questionnaire online. The interview method may generate a high response rate, and uncertainties and partial responses can be followed up immediately. As a result, this method can reduce misunderstandings and significantly improve study results.

CONCLUSION

In conclusion, the primary purpose of this research was to examine the relationship between the service related to accommodation, facilities at the destination, services related to the travel agency, and the satisfaction of tourists. Data obtained from the questionnaire had been evaluated through a software program using the Statistical Package for Social Sciences (SPSS). As mentioned in Chapter 4, a total number of 253 respondents that involve throughinvolved the online survey method (Google Form). The questionnaire survey results were analyzed by descriptive analysis, reliability analysis, and Pearson correlation analysis. The finalized result showed an influence relationship between services related to accommodation, facilities at the destination, and services related to the travel agency with the tourists' satisfaction.

ABSTRACT

This study examined the acceptance of e-commerce in the fast-food industry among Malaysians and investigates the relationship between perceived ease of use, perceived usefulness, and behavioural intention toward e-commerce in the fast-food industry. A quantitative investigation was conducted to complete the study. 384 questionnaires were distributed through google Forms to collect the data from the respondents. Simple random sampling was utilized to distribute the questionnaires. The data was analysed using descriptive analysis, reliability testing, and Pearson correlation. This research data was analysed with SPSS 26.0 for reliability measures, and Pearson correlation was applied to determine the relationship between the independent and dependent variables in this study. This research contributed to the academicians and practitioners by examining perceived ease of use, perceived security, and perceived usefulness influenced the behavioural intention of Malaysian consumers using e-commerce in the fast-food industry.

Keywords: E-commerce, Fast-Food Industry, Perceived Ease of Use, Perceived Usefulness

INTRODUCTION

The use of e-commerce in restaurants in Malaysia is much needed and maintained due to the high attraction to traders and consumers. Malaysia's strategic location and dynamic economy are the main attractions of the e-commerce market. The advancement of infrastructure for digital technology has also contributed to the growth of e-commerce in Malaysia (Nation Master, 2019).

The consumer intention to use E-Commerce in the fast-food industry among Malaysians is rising. Social commerce has grown in popularity because of Facebook, LinkedIn, Instagram, and other social media sites (Patwary & Rashid, 2016).

E-commerce provides various services such as online shopping, online banking and E-enterprise, which are also emerging trends. Online shopping is the biggest service of e-commerce which allows consumers to buy, order and view goods and services online through their gadgets, anywhere they are (Kariyawasam, 2008).

Due to the fierce competition in the online industry, online merchants are now seeking to meet the expectations of every customer. Client happiness is critical for preserving profitability and establishing long-term customer relationships. Furthermore, customer satisfaction was an important mediator between service quality and purchase intent (Bou-Llusar et al., 2001).

The willingness of Malaysians to use e-commerce in the fast-food industry was assessed in this study. Fewer restrictions and limitations have the potential to have a significant impact on the growth of e-commerce-only businesses. This initiative will be able to cover the research gap that this study has revealed. It can also help companies and researchers properly understand the psychology of social platform users, resulting in a better user experience. There are two objectives of this research:

1. To identify the relationship between perceived ease of use and behavioural intention towards e-commerce in the fast food industry.

2. To identify the relationship between perceived usefulness and behavioural intention towards e-commerce in the fast food industry.

Significance of the Study

Body of knowledge

The research examined the usefulness and safety of e-commerce services in the fast-food industry. Based on this study, the data obtained will help the community review the strengths and weaknesses of e-commerce. As a result, the community can get insight into the safety and convenience of using e-commerce, encouraging the community to use e-commerce.

Stakeholders

The related data in this study can help to reveal the intentions of Malaysians of different ages to engage in e-commerce. The data from this study will also help convince stakeholders such as governments to invest in e-commerce. For example, the government is investing in e-commerce to encourage young people to pay for and buy goods using e-commerce. Therefore, it changes the community's perception and encourages them to support e-commerce services.

Benefits

Ultimately, students also benefit from this study. University students may use the research data for research purposes, particularly relating to the services attributed to e-commerce. In other words, this study provides new opportunities for other researchers to learn more about the technology of e-commerce in the fast-food industry.

LITERATURE REVIEW

Overview of Worldwide Technology for The Fast-Food Industry

Research to Research and Markets (2020), from 2020 to 2027, the worldwide fast-food market is predicted to rise at a 4.6 percent annual rate, reaching $ 931.7 billion. The global fast-food market is expected to grow significantly during the forecast period due to an increase in the number of fast-food restaurants, the number of working women, technologically advanced ordering options, increased demand for international cuisine, and changes in consumer taste and preferences. Besides, customers rarely use their smartphones to purchase products or conduct online banking (Alom et al., 2019). However, customers in the fast-food industry, on the other hand, prefer to buy meals online, according to a recent e-commerce study (Yeo et al., 2017). Utilizing this, the current study explores potential areas where certain categories of mobile phones can be identified to highlight the economic value in the fast-food industry.

Behavioral Intention to Use E-Commerce

As a primary determinant of the behavioural intention of a person to adopt a given technology (Chen et al., 2019; Cimperman et al., 2016; Dwivedi et al., 2019; Morosan & DeFranco, 2016; Slade et al., 2015; Patwary et al., 2020; Zhou et al., 2010), the strongest predictor of attitudes toward behavioural intentions to use is projected performance (Jeng & Tzeng, 2012). As a result, consumer expectations about new e-commerce platforms impact their propensity to use them. Users will be more willing to use the new e-commerce platforms because of the increased efficiency. For consumers who have busy lives, time is money and time savings are fundamental to them as long as the service can provide pleasure and meet their needs (Aren et al., 2013).

Perceived Ease of Use

User-perceived ease of use encompasses a person's ability to utilize an invention without trouble and pick the highest quality of service by comparing the features and advantages of a variety of services. Consumers' perceptions of ease of use represent their view that they will utilise it appropriately after following instructions or using the service for a reasonable time. Consequently, perceived ease of use predicts behavioural intention to utilize an information service (Patwary et al., 2022).

Perceived Usefulness

In an e-commerce setting, the more user-friendly a website is, the more users will believe that the website is operating in good faith, increasing users' confidence (Chen & Teng, 2013). Users attain perceived performance when they know that utilising the recommender system will improve their performance compared to not using it (Patwary, 2022). Criteria for determining the level of consumer confidence to believe the right choice has been made possible through recommenders (Pu & Chen, 2011).

Research Hypothesis

The literature review highlighted that the independent variables such as perceived usefulness and ease of use of e-commerce, and the dependent variable is behavioural intention. Based on the literature discussed, the hypotheses of this research were tested:

H₁ There is a significant relationship between perceived ease of use and the behavioural intention to use e-commerce.

H₂ There is a significant relationship between perceived usefulness and the behavioural intention to use e-commerce.

Research Framework

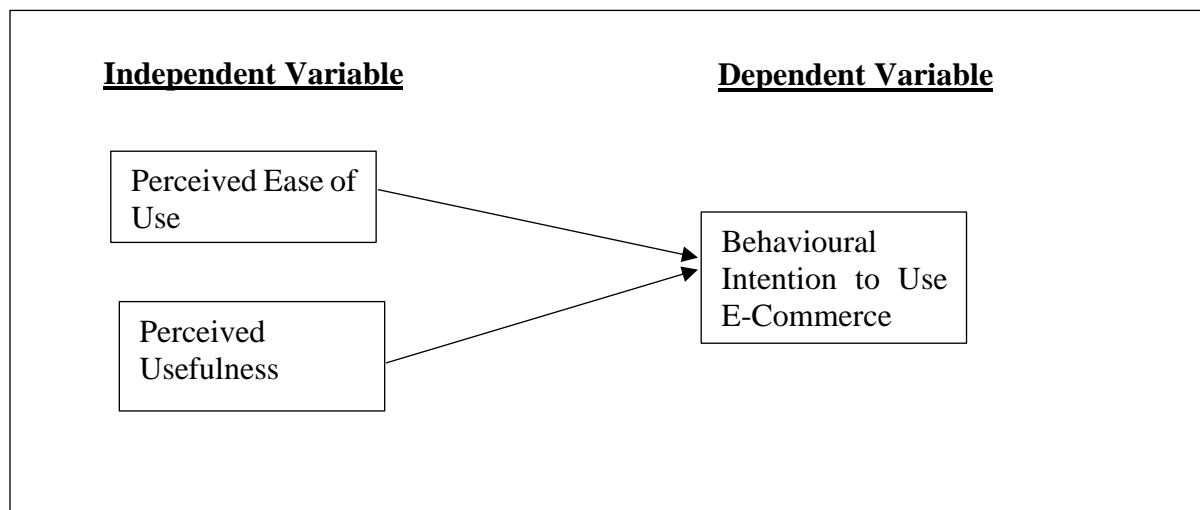
The Figure 1 below shows the research framework use for this study


Figure 20: Research Framework

METHODOLOGY

Research Design

Research design is the framework of the research method and technique chosen by a researcher. Basically, it involves the kind of facts that needed to investigate a theory, to collect interpret phenomena to evaluate a program. The design can help researcher to develop their research methods, which are appropriate for subject matter, and tos develop their research methods, which are appropriate for subject matter, and create their studies for success. There are one type of study, which is quantitative. For quantitative design have four core are descriptive, correlation, quasi-experimental and experimental. The research has 3 sections A for demographic profile, question B and C of the questionnaire Malaysian consumer intention of using E-commerce in fast food industry.

Data Collection

The survey of this study used a self-service data collection mode in which respondents were asked to fill out the questionnaire themselves. The questionnaire will be sent individuals to

answer. After agreeing to fill out the question, the respondent is explained. There is no obligation to complete research questions. It is returned after the respondent fills out the questionnaire. Online questionnaires are used to collect the data for this research. A set of questionnaires has been assigned to the young people in Malaysia. The questionnaire highlights the research's intent and study goals and acknowledges that the respondent's information is confidential.

Sampling

Sampling was selected by state and district, 384 participants were selected using simple random sampling. According to Wilson (2010) random and simple sampling is best suited for survey strategies. This sampling is selected depending on the population's characteristics and the study's objectives. So, the researcher needs to make sure that this sample is completely random because using this randomly selected and simple sample, it can avoid the occurrence of unwanted effects. The research has 384 respondents to the answer in Google form. An online questionnaire was created using Google form and link Google form to share all respondents answers.

Data Analysis

Four types of data analysis were used in this study: frequency analysis, descriptive analysis, reliability test and Pearson correlation analysis. The data obtained was analysed by using SPSS version 26.

FINDINGS

Result of Frequency Analysis

The Table 1 below shows the result of frequency analysis.

Table 1: Frequency Analysis

Characteristics	Frequency	Percentage
Gender		
Male	128	33.3
Female	256	66.7
Age		
19-21	77	20.1
22-24	221	57.6
25-27	34	8.9
28-30	52	13.5
Race		
Malay	305	79.4
Chinese	50	13.0
Indian	21	5.5
Others	8	2.1
Education Level		
PT3/PMR	8	2.1
SPM	34	8.9
STPM	52	13.5
Diploma	70	18.2
STAM	4	1.0
Matriculation	13	3.4
Foundation	18	4.7
Degree	178	46.4

Master		6	1.6
UPSR		1	0.3
Experience in Using E-commerce Application			
Never		25	6.5
Once		36	9.4
2-3 times		93	24.2
Over five times		107	27.9
Many time		123	32.0

Table 1 shows the characterization of respondents. 128 out of 384 respondents are male, representing 33.3%, while 256 respondents are female, representing 66.7%. 79.4% of the respondents are Malays, 13% of the respondents are Chinese, 5.5% of the respondent are Indian, and 2.1% of the respondents are others. The highest percentage for the age of respondents is 57.6%, 22-24 years old. 46.4% out of the total education level of respondents from the degree education, 32% of the respondents experience many times using e-commerce application.

Result of Descriptive Analysis

The Table 2 below shows the result of descriptive analysis.

Table 2: Descriptive Analysis

Variable	Items	Mean Score	Standard Deviation
Perceived Ease of Use	It was simple for me to learn how to use fast food mobile applications or e-commerce on the smartphone.	4.22	0.87
	I noticed that using the fast-food industry's websites or mobile applications to fulfil my needs was simple.	4.18	0.87
	It was easy for me to become proficient in fast food mobile applications.	4.20	0.88
	It is simple for me to remember how to use e-commerce applications.	4.19	0.86
	Overall, I found out the e-commerce application in the fast-food industry is easy to use.	4.17	0.84
Perceived Usefulness	My time has been saved by using e-commerce applications.	4.15	0.86
	The E-commerce applications allows me to shop at my fingertips.	4.29	0.82
	Using e-commerce applications increase the effectiveness of the shopping and payment process.	4.23	0.86
	Using e-commerce applications reduce my time spent on unproductive activities.	4.08	0.91
	Overall, I find that e-commerce applications are useful in the fast-food industry.	4.20	0.84
Behavioural Intention	Using e-commerce applications is a great idea.	4.20	0.82

to Use E-commerce Application	Using e-commerce applications are advisable for me.	4.17	0.80
	E-commerce applications are enjoyable to use for me.	4.15	0.84
	I intend to use e-commerce applications for the fast-food industry again in the future.	4.20	0.85
	I am rather likely to recommend e-commerce technologies in the fast-food industry to a friend.	4.19	0.83

"Perceived Ease of Use" indicates that fast food mobile applications or e-commerce was easy to use since respondents agreed with most of the items. Respondents agreed that it was simple to learn how to use fast food mobile applications or e-commerce on the smartphone (mean =4.22, SD =0.87). Respondents agreed that using the fast-food industry's websites or mobile applications was simple. (mean = 4.18, SD = 0.87). In addition, respondents agreed that it was easy to become proficient in fast food mobile applications. (mean = 4.20, SD = 0.88).

"Perceived Usefulness" indicates that e-commerce applications are useful in the fast-food industry since respondents agreed with most of the items. Respondents agreed that time had been saved by using e-commerce applications (mean = 4.15, SD = 0.86). Respondents also agreed that e-commerce applications allow them to shop at fingertips (mean = 4.29, SD = 0.82). Respondents agreed that using e-commerce applications increases the effectiveness of the shopping and payment process. (mean = 4.23, SD = 0.86). Using e-commerce applications to reduce time spent on unproductive activities scored a mean of 4.08 and a standard deviation of 0.91.

For the dependent variable is behavioural intention to use an e-commerce application. Respondents agreed that using e-commerce applications is a great idea (mean = 4.20, SD = 0.82). Respondents also agreed that using e-commerce applications are advisable (mean = 4.17, SD = 0.80). Respondents feel e-commerce applications are enjoyable to use (mean = 4.15, SD = 0.84). Respondents are rather likely to recommend e-commerce technologies in the fast-food industry to a friend (mean = 4.19, SD = 0.83). Overall, respondents intend to use e-commerce applications for the fast-food industry again in the future. (mean = 4.20, SD = 0.85).

Result of Reliability Analysis

The Table 3 below shows the result of reliability analysis

Table 3: Reliability Analysis

Variable	Number of Items	Cronbach Alpha
Perceived Ease of Use	5	0.930
Perceived Usefulness	5	0.907
Behavioural Intention to Use E-commerce Application	5	0.935

Based on table 3, Pearson's correlation analysis was used in testing the relationship between hypotheses on a significant relationship such as perceived ease of use and perceived usefulness with the relationship of behavioural intention to use e-commerce. The result of all hypotheses stated were accepted at a 0.01 significant level.

Result of Pearson Correlation Analysis

The Table 4 below shows the Pearson Correlation Analysis

Table 4: Pearson Correlation Analysis

Hypothesis	P-Value	Result (Supported/Not Supported)
H$_1$: There is a significant relationship between perceived ease of use and the behavioural intention to use e-commerce.	0.834	H$_1$ is supported
H$_2$: There is a significant relationship between perceived usefulness and the behavioural intention to use e-commerce.	0.877	H$_2$ is supported

The result in Table 3 indicates that perceived ease of use and the behavioural intention to use e-commerce showed 0.834, which indicated a high linear relationship. Following perceived usefulness and the behavioural intention to use e-commerce showed 0.877 indicating high linear relationship. All two variables positively correlated with behavioural intention to use e-commerce, and the relationship is significant ($p<0.01$).

DISCUSSION AND RECOMMENDATION

Based on the result of Pearson correlation analysis, hypothesis H$_1$, there is a significant relationship between perceived ease of use and the behavioural intention to use e-commerce, was supported. Perceived ease of use is defined in this study as the degree to which people believe it would be simple to do business over the internet, also known as e-commerce. According to research on technology acceptability, perceived ease of use has a favourable impact on the internet (Davis et al., 1989). Consumer intentions for e-commerce technologies in the internet environment are predicted to be positively influenced by perceived ease of use. In e-commerce, the perceived ease of use transformation for an application might be limited by product type.

The hypothesis H$_2$ $_{that}$ there is a significant relationship between perceived usefulness and the behavioural intention to use e-commerce was also supported by Pearson Correlation analysis. Perceived Usefulness is a utilitarian aspect that needs to be taken into account, especially for smartphone users who can easily use their gadgets for entertainment and solve their problems (Yang, 2010). According to research from Davis et al. (1989), perceived usefulness focuses on the perception that people think technology can help them improve their performance. If the technology improves the productivity and efficiency of users, it will make them believe that the system is worth using. An analysis conducted by Zhang et al. (2012) on the use of e-commerce found that the relationship between perceived usefulness and the behavioural intention was tested in 38 of 58 studies, highlighting the popularity and reputation of the perceived usefulness construct among e-commerce researchers and validating its influence on a person's intention to use e-commerce services (Zhang et al., 2012).

This study has limitations that make it challenging for the researchers to complete. Some challenges should be emphasised for future study needs. Future studies should develop a new strategy to obtain improved findings, such as conducting interviews using open-ended questions to obtain a high response rate from the respondent, clear explanations, and greater comprehension. The researchers then concentrated primarily on three criteria, although additional determinants may also play a role in determining intention to use e-commerce. The study's scope will be broader, and more information will be achieved.

CONCLUSION

The summary of this study provides a basic understanding of consumers' intentions to use e-commerce in the fast-food industry among Malaysians. Two research questions have been identified based on two specific objectives: to identify the relationship between perceived ease of use and behavioural intention towards e-commerce and the relationship between perceived

usefulness and behavioural intentions towards e-commerce. The conceptual framework developed according to the literature review aimed at analysing the dependent variables behavioural intention to use e-commerce, and independent variables are perceived ease of use and perceived usefulness. A total of 384 respondents from the age of 19 years old to 30 years old were selected from all states in Malaysia to examine the behavioural intention to use e-commerce applications among Malaysians. Overall, the finding of this study have proven that there is a connection between perceived ease of use, perceived usefulness and behavioural intentions to use e-commerce applications among Malaysian.

ABSTRACT

A leadership style is defined as a 'leader's attitude and characteristic behaviours when motivating, directing, guiding, and managing people or employees. Great leaders can inspire political movements and society and motivate and encourage others to perform well, create, and be innovative. This study aims to find leadership styles that affect employee job satisfaction in the hotel industry. This study will be conducted to investigate the relationship between transactional leadership, transformational leadership, charismatic leadership and the attitude of the employees in the hotel industry. The study will use the quantitative method through a google form. The final result showed a significant relationship between transactional leadership, transformational leadership, charismatic leadership, attitude, and employee job satisfaction in the hotel industry.

Keywords: Transactional Leadership, Transformational Leadership, Charismatic leadership, Attitude, Employee Job Satisfaction

INTRODUCTION

According to Aronson (2001), a leadership style that delivers direction implements plans and motivates people is their leadership style. Good leadership boosts employee engagement and excitement, which leads to improved customer loyalty, service, innovation, and revenue. Leadership style plays a part in an organisation's performance. Employee work satisfaction will be affected by the impact of different leadership styles on the performance of an organisation, particularly in the hotel business. Three leadership styles, transactional leadership, transformational leadership, and charismatic leadership attitudes show the impact on employee job satisfaction. This helps in the company's growth and has an impact on its future success. This is accomplished by executives who set an example by focusing on business culture, employee ownership, and workplace independence.

According to Patwary (2022), a positive relationship with the boss motivates the subordinate to go above and beyond his daily responsibilities, continually improve his work performance, and provide the highest level of client satisfaction. Every organization surely has its leader to lead the way. Great leaders can communicate effectively, inspire their team, manage and allocate responsibilities, listen to feedback, and solve problems in a continuously changing environment. Everything in an organization headed by leaders will impact job performance and employee satisfaction. Employee work satisfaction will be influenced by the impact of leadership styles on organizational success. There are four objectives of this research:

1.To identify the relationship between transactional leadership and the hotel industry employees' attitude.

2.To identify the relationship between transformational leadership and the hotel industry employees' attitude.

3.To identify the relationship between charismatic leadership and hotel industry employees' attitude.

4.To identify the relationship between attitude and job satisfaction in the hotel industry.

Significance of the Study

The study's relevance will boost researchers' and students' understanding of the relationship between leadership styles on attitude and job satisfaction of employees in the hospitality sector. The information gathered in this study will aid in comprehending the significance of leadership styles in the hotel industry.

Due to it, researchers, practitioners, and managers will become more concerned about important leadership styles in hotel organizations.

The findings are intended to equip leaders with the knowledge to execute concrete recommendations and make sound judgments about leadership styles, attitudes, and employee job satisfaction to lead the business to success. A leader should be able to lead even better for the success of an organization and please his subordinates with the knowledge gained from this study.

LITERATURE REVIEW

Transactional Leadership Among Attitude and Employee Job Satisfaction
